Check and install a new integrated control panel as required, refer to the new module/component installation note at the top of the DTC Index
U300041	Control Module	<ul style="list-style-type: none"> ● Checksum error, internal module failure 	Suspect the integrated control panel, check and install a new integrated control panel as required, refer to the new module/component installation note at the top of the DTC Index

Touch Screen Display (TSD)

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the

Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

- NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

- NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

- NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action

Information and Entertainment System - General Information - Cellular Phone

Diagnosis and Testing

Principle of Operation

For a detailed description of the Cellular Phone System, refer to the relevant Description and Operation sections in the workshop manual.

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Microphone ● Bluetooth antenna 	<ul style="list-style-type: none"> ● Electrical connectors ● Wiring harness for damage or corrosion ● Fuses

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the relevant DTC Index.

Symptom Chart

Symptom	Action
Unable to pair	<ul style="list-style-type: none"> ● GO to Pinpoint Test A.
Not Auto Connecting	<ul style="list-style-type: none"> ● GO to Pinpoint Test B.
No Audio to 3rd Party	<ul style="list-style-type: none"> ● GO to Pinpoint Test C.
No Audio from 3rd Party	<ul style="list-style-type: none"> ● GO to Pinpoint Test D.
No Audio	<ul style="list-style-type: none"> ● GO to Pinpoint Test E.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action

U300044	Control Module	<ul style="list-style-type: none"> Data memory failure 	Re-configure the telephone module. If the DTC remains, suspect the telephone module. Check and install a new telephone module as required, refer to the new module/component installation note at the top of the DTC Index
U300045	Control Module	<ul style="list-style-type: none"> Program memory failure 	Re-configure the telephone module. If the DTC remains, suspect the telephone module. Check and install a new telephone module as required, refer to the new module/component installation note at the top of the DTC Index
U300055	Control Module	<ul style="list-style-type: none"> Incorrect car configuration data received 	Re-configure the RJB using the manufacturer approved diagnostic system. Clear DTC and re-test. If the DTC remains suspect the telephone module. Check and install a new module as required, refer to the new module/component installation note at the top of the DTC Index
U300098	Control Module	<ul style="list-style-type: none"> Component or system over temperature 	Check for additional DTCs and refer to DTC Index. Clear DTC and re-test/monitor condition for re-occurrence
U300362	Battery Voltage	<ul style="list-style-type: none"> Mis-match in battery voltage, of 2 volts or more, between telephone module and RJB 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system

Pinpoint Tests

PINPOINT TEST A : UNABLE TO PAIR	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: 'NO PHONE FITTED' DISPLAY	
<ul style="list-style-type: none"> NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the bluetooth function is activated and the telephone handset is placed within the vehicle cabin area. 	
	1 Carry out checks to determine if 'No Phone Fitted' is shown on vehicle display.
	Is 'No Phone Fitted' displayed? Yes GO to A2. No Locate the connected telephone and if not Customer telephone, disconnect from the system.
A2: TELEPHONE BLUETOOTH DEVICE SEARCH	
	1 Carry out Bluetooth device search using Customer handset.
	Is 'Jaguar' identified in Bluetooth device list? Yes Select device from list, then continue with diagnosis. GO to A3. No Carry out further Bluetooth device search, to a maximum of 4 times, waiting approximately 20 seconds between searches. If 'Jaguar' still not identified in Bluetooth device list, set ignition status to OFF, wait approximately 30 seconds and set ignition status to ON. Carry out further Bluetooth device search, to a maximum of 4 times, waiting approximately 20 seconds between searches. If 'Jaguar' still not identified in Bluetooth device list, contact your local in market support for further assistance.
A3: TELEPHONE HANDSET ERROR	
	1 Check for any error shown on the telephone handset when 'Jaguar' is selected from the Bluetooth device list.
	Was an error immediately shown on the telephone handset? Yes Wait approximately 10 seconds then re-attempt selection, to a maximum of 4 times, waiting approximately 10 seconds between each attempt. If error still being displayed, contact your local in market support for assistance. No Enter PIN '1313' then continue with diagnosis. GO to A4.
A4: PIN ENTRY STATUS	
	1 Check for successful PIN entry.
	Was PIN entry successful? Yes GO to A5. No Wait approximately 10 seconds then re-attempt PIN entry, to a maximum of 4 times, waiting approximately 10 seconds between each attempt. If PIN entry is still un-successful, contact your local in market support for assistance.
A5: 'NO PHONE FITTED' DISPLAY	

	1 Carry out checks to determine if 'No Phone Fitted' is still shown on vehicle display.
Is 'No Phone Fitted' still displayed?	<p>Yes</p> <p>From the telephone handset, select the connect option for the 'Land Rover' device identified in the Bluetooth device list. If 'No Phone Fitted' is still displayed, suspect a telephone handset fault. Carry out Pinpoint test again using known good telephone handset.</p> <p>No</p> <p>The telephone is paired and connected to the system. No further action is required for this symptom.</p>

PINPOINT TEST B : NOT AUTOMATICALLY CONNECTING

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
------------------------	--------------------------------

B1: BLUETOOTH MODULE PAIRED DEVICE LIST

• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the bluetooth and auto connect functions are activated and the telephone handset is placed within the vehicle cabin area.

	1 Carry out checks to determine if the Customer telephone is shown in the Bluetooth Module paired device list.
--	---

Is the Customer telephone in the Bluetooth Module paired device list?	<p>Yes</p> <p>GO to B2.</p> <p>No</p> <p>Carry out Unable to Pair Pinpoint Test. GO to A.</p>
---	---

B2: CUSTOMER HANDSET PAIRED DEVICE LIST

	1 Carry out checks to determine if the Bluetooth Module is shown in the Customer telephone paired device list.
--	---

Is the Bluetooth Module in the Customer telephone paired device list?	<p>Yes</p> <p>GO to B3.</p> <p>No</p> <p>Carry out Unable to Pair Pinpoint Test. GO to A.</p>
---	---

B3: CUSTOMER TELEPHONE IN POSITION 1

	1 Carry out checks to determine if the Customer telephone is in position 1 in the Bluetooth Module paired device list.
--	---

Is the Customer telephone in position 1?	<p>Yes</p> <p>GO to B4.</p> <p>No</p> <p>Advise Customer that auto connection will only be attempted with the device that is shown in position 1 in Bluetooth Module paired device list.</p>
--	--

B4: CHECK FOR DTC B1A56-13

	1 Using Manufacturer approved diagnostic system, check for DTC B1A56-13.
--	---

Is DTC B1A56-13 logged?	<p>Yes</p> <p>Carry out remedial actions as outlined in DTC Index. If symptom remains, contact your local in market support for assistance.</p> <p>No</p> <p>GO to B5.</p>
-------------------------	--

B5: BLUETOOTH CONNECTION

	1 Carry out checks to determine if Bluetooth connection icon is shown on Customer Bluetooth telephone screen but shows 'No Phone Fitted' on vehicle screen.
--	--

Is Bluetooth connection icon shown on the Customer handset but 'No Phone Fitted' displayed on vehicle screen?	<p>Yes</p> <p>GO to B9.</p> <p>No</p> <p>GO to B6.</p>
---	--

B6: 'LAND ROVER' AUTHORISATION

• NOTE: Some handsets may require operator intervention to manually authorise connection.

	1 Carry out checks to determine if 'Land Rover' is authorised in the Customer Bluetooth telephone device list menu.
--	--

Is 'Land Rover' authorised in the Customer Bluetooth telephone device list menu?	<p>Yes</p> <p>GO to B7.</p> <p>No</p> <p>Advise customer that 'Land Rover' needs to be authorised in the Customer Bluetooth telephone device list menu, or operator intervention may be required to manually authorise connection.</p>
--	--

B7: SEARCH FOR DEVICES SCREEN

	1 Select the search for devices button on the vehicle display.
--	---

Does pressing the search for devices button bring up the searching screen on the vehicle display?	<p>Yes</p> <p>Contact your local in market support for assistance.</p> <p>No</p> <p>GO to B8.</p>
---	---

B8: CYCLE IGNITION AND CHECK SEARCH FOR DEVICES SCREEN

	1 Lock vehicle (wait 60s) before unlocking and turning Ignition status back to ON.
--	---

Does pressing the search for devices button bring up the searching screen on the vehicle display?	<p>Yes</p> <p>No further action required for this Symptom. Possible intermittent fault.</p> <p>No</p> <p>Contact your local in market support for assistance.</p>
---	---

B9: PAIRED DEVICE	
	<p>1 Check Customer telephone paired device list to establish which device the Customer telephone is connected to.</p>
	<p>Is the Customer telephone connected to the vehicle?</p> <p>Yes Lock vehicle (wait 60s) before unlocking and turning Ignition status back to ON. If Not Automatically Connecting, contact you local in market support for assistance.</p> <p>No Using the Customer telephone controls, disconnect from the currently connected device and delete from paired device list. Lock vehicle (wait for 60s) before unlocking and turning Ignition status to ON. If Not Automatically Connecting, contact your local in market support for assistance.</p>

PINPOINT TEST C : NO AUDIO TO THIRD PARTY	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: MICROPHONE DIAGNOSTIC TROUBLE CODES (DTCS)	
<p>• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.</p>	
	<p>1 Using the Manufacturer approved diagnostic system, check for any logged microphone DTCs in Audio Front Control module.</p>
	<p>Is DTC B1D79-01 logged?</p> <p>Yes Carry out diagnosis of electrical failure as advised in Action column of DTC Index.</p> <p>No Contact your local in market support for assistance.</p>

PINPOINT TEST D : NO AUDIO FROM THIRD PARTY	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: 'IN CALL' DISPLAY	
<p>• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.</p>	
	<p>1 Carry out checks to determine if 'In Call' is shown on the vehicle display.</p>
	<p>Is vehicle display showing 'In Call'?</p> <p>Yes Contact your local in market support for assistance.</p> <p>No Call has ended. No further action is required for this symptom.</p>

PINPOINT TEST E : NO AUDIO	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: AUDIO FROM THIRD PARTY	
<p>• NOTE: Prior to continuing with any diagnosis, ensure that the Customer telephone and level of software is included on the JLR approved list, the telephone battery is fully charged and in a serviceable condition, the telephone is placed within the vehicle cabin area and is connected to the vehicle via bluetooth.</p>	
	<p>1 Establish from Customer feedback/symptom if there is Audio from the Third Party.</p>
	<p>Is there Audio from the Third Party?</p> <p>Yes GO to E2.</p> <p>No Refer to the 'No Audio From Third Party' Pinpoint test. GO to D.</p>
E2: AUDIO TO THIRD PARTY	
	<p>1 Establish from Customer feedback/symptom if there is Audio to the Third Party.</p>
	<p>Is there Audio to the Third Party?</p> <p>Yes GO to E3.</p> <p>No Refer to the 'No Audio To Third Party' Pinpoint test. GO to C.</p>
E3: CD OR RADIO AUDIO

[Video System](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Information and entertainment module ● Audio amplifier module ● Integrated audio module ● Portable audio interface module ● Digital audio broadcast module ● Integrated control panel ● Touch screen display ● Satellite radio module ● Television module ● Navigation system module ● Telephone module ● Compact disc player jammed, not loading ● Scratched/dirty compact discs ● Speakers 	<ul style="list-style-type: none"> ● Fuses ● Loose or corroded connector(s) ● Information and entertainment module ● Audio amplifier module ● Integrated audio module ● Portable audio interface module ● Digital audio broadcast module ● Integrated control panel ● Touch screen display ● Satellite radio module ● Television module ● Navigation system module ● Telephone module ● Speakers

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the relevant DTC Index.

DTC Index

Navigation System Module

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action

Information and Entertainment System - Audio System - Overview

Description and Operation

OVERVIEW

The audio system is available in three versions.

- Jaguar Sound System
- Jaguar 320W Premium Sound System
- Bowers & Wilkins 440W Surround Sound System

The audio systems are instrument panel mounted and combine the radio tuner with a slot loading single or 6 disc [CD \(compact disc\)](#) player. All units have AM/FM diversity reception, through the diversity antenna module, which receives signals from antennas located in the heated rear window. The audio systems have various levels of user control through the Touch-screen, ICP (integrated control panel) and steering wheel control panel. The Jaguar Sound System (base audio unit) with single [CD](#) player is only compatible with standard [CD](#)'s. All other versions of [CD](#) player are compatible with standard [CD](#)s and [CD](#)s with MP3 or WMA (windows media audio) files.

A portable audio module allows for the connection of a range of portable audio devices to the car's audio system. The portable audio module is controlled through the IAM (integrated audio module) and Touch-screen with play back through the car's speaker system. The introduction of this system allows the user to import their personal portable media player to interface with the car, including iPod and other MP3 players, or USB mass storage devices such as memory sticks. MP3 players can also be controlled through the Touch-screen if they are configured as mass storage devices. Details of how to do this will be contained in the manufacturers instructions.

The chosen audio device can be plugged into the car using an interface panel located in the floor console between the front seats. The interface includes a 3.5mm auxiliary jack-plug socket, a 12-volt power supply, a dedicated iPod connector with charging function, plus a USB2 connector which allows connectivity for a wide variety of USB devices. The USB port also provides a charging function although it **does not** support a USB hub. The maximum charging current supplied is 500ma. The user can connect an iPod and USB device at the same time, changing the source via the Touch-screen. The non selected source will still charge.

The Jaguar Sound System is the basic audio system which comprises of an IAM (integrated audio module) with no external amplifier and 8 speakers.

The Jaguar 320W Premium Sound System has the addition of an AUD 8 power amplifier and a 9 speaker system.

The Bowers & Wilkins 440w Surround Sound System additions include an AUD 12 power amplifier, a Dolby Pro-Logic 2 7.1 Surround Sound System, and 14 speakers.

DAB (digital audio broadcasting) is available for most European markets and gives access to digital radio channels for better sound quality and enhanced functionality depending on local service availability. The DAB (digital audio broadcasting) module is located in the luggage compartment. The system receives reception signals from the following sources to ensure optimum signal strength.

- DAB band L antenna located in the roof pod antenna module
- DAB band III antenna located in the heated rear window.

For NAS vehicles the digital format adopted is satellite radio which specifically links to the Sirius network. The system operates in the S-band frequency range, and as a result of the use of satellite transmission, has the ability to provide [CD](#) quality audio broadcasts over very large areas (typically continents). The satellite radio receiver is located in the luggage compartment. The system receives reception signals from the satellite radio antenna located in the roof pod module.

Primary user control of the audio system is via the ICP (integrated control panel) and the Touch-screen which are located in the center of the instrument panel. Control signals from the ICP (integrated control panel) are relayed on the medium speed [CAN \(controller area network\)](#) bus to the ICM (information control module). The ICM (information control module) relays the control signals to the rest of the audio system on the MOST (media oriented systems transport) ring. The ICM (information control module) is the timing master for the MOST (media oriented systems transport) ring and also hosts a gateway function between the medium speed [CAN](#) bus and the MOST (media oriented systems transport) ring. Audio output signals on the Jaguar 320W Premium Sound System and Bowers & Wilkins 440W Surround Sound System are sent on the MOST (media oriented systems transport) ring from the IAM (integrated audio module) to the power amplifier for speaker output.

System Operation

AUDIO SYSTEM OPERATION

The components of the audio/infotainment system are all connected on the MOST (media orientated systems transport) ring. The MOST (media orientated systems transport) ring is a fibre optic communications bus for multimedia applications. Audio and control information is passed around the MOST (media orientated systems transport) ring and can be picked up by any of the systems units. For example, radio station tuning/selection input by the vehicle user into the Touch-screen is sent along the MOST (media orientated systems transport) ring and collected by the IAM (integrated audio module) which then selects the requested radio station.

MOST (media orientated systems transport) technology uses a plastic optical fibre which forms a network connecting the audio and multimedia system components. Each component in the ring is connected to the plastic optical fibre through a device known as a FOT (fibre optical transceiver). Each FOT (fibre optical transceiver) has two optical connections; one connection is sensitive to light and is the input, the second connection forms the light source and is the output. The system operates by connecting the output from one FOT (fibre optical transceiver) to the input of another FOT (fibre optical transceiver).

The light signals are sent in one direction only and are formed in the following way:

- Electrical signals are converted into an electrical current
- The current then drives an **LED (light emitting diode)** in the FOT (fibre optical transceiver) to produce a high intensity red light
- The **LED** transmits the light through a fibre optic cable
- A photo diode in the FOT (fibre optical transceiver) at the opposite end of the fibre optic cable detects the light.

The following components may be connected to the MOST ring dependant on the vehicle equipment level:

- IAM (integrated audio module)
- Touch-screen
- ICM (information control module)
- DAB (digital audio broadcasting) radio receiver (Optional - Europe only)
- Satellite radio digital receiver (Optional - NAS only)
- Power amplifier (Not fitted to the Jaguar Sound System)
- Portable audio module (Optional)
- Telephone control module (Optional)
- Navigation computer (Optional)
- TV tuner (Optional)

• **NOTE: Do not view the red light directly**

MOST is a synchronous network. A timing master supplies the clock information and all other devices on the network synchronize their operation to this clock. The timing master for the MOST (media orientated systems transport) network on this vehicle is the ICM (information control module). This unit also controls and manages the MOST (media orientated systems transport) ring and the system components.

An Optical Bus tester is used in conjunction with the Jaguar diagnostic system to diagnose the MOST (media orientated systems transport) system. The Optical Bus tester emits a visible, high intensity red light which can be connected into the ring at any point to test the ring integrity. Disconnecting a MOST (media orientated systems transport) connector will reveal if the high intensity red light is visible.

If a break occurs in the MOST (media orientated systems transport) ring fault codes are stored in the ICM (information control module) which can be retrieved using the Jaguar diagnostic system equipment.

With reference to the audio system information and signal transfer the instrument cluster is the gateway between the high and medium speed **CAN** bus communication protocols. The ICM (information control module) is the gateway between medium speed **CAN** and the MOST (media orientated systems transport) systems.

A typical example of information transfer is vehicle speed information from the **ABS (anti-lock brake system)** module used to control the automatic volume control function. The vehicle speed information from the **ABS** module is sent on the high speed **CAN** network and collected by the instrument panel gateway. The signal is passed to the medium speed **CAN** network and onto the ICM (information control module) gateway. The ICM (information control module) calculates the volume adjustment required. The corrected audio volume level signal is sent on the MOST (media orientated systems transport) network to the IAM (integrated audio module) or Power amplifier (dependant on vehicle equipment level) for output to the speaker system.

AUDIO SYSTEM GATEWAY FUNCTIONS

With reference to the audio system information and signal transfer the instrument cluster is the gateway between the high and medium speed **CAN** bus communication protocols. The ICM is the gateway between medium speed **CAN** and the MOST systems.

A typical example of information transfer is vehicle speed information from the **ABS (anti-lock brake system)** module used to control the automatic volume control function. The vehicle speed information from the **ABS** module is sent on the high speed **CAN** network and collected by the instrument panel gateway. The signal is passed to the medium speed **CAN** network and onto the ICM gateway. The ICM calculates the volume adjustment required. The corrected audio volume level signal is sent on the MOST network to the IAM or Power amplifier (dependant on vehicle equipment level) for output to the speaker system.

AUDIO SYSTEM USER CONTROLS

Touch-Screen

E96378

ItemDescription

1	Touch-screen
2	Home menu button
3	Touch-screen on/off button

The Touch-screen forms the basis of the audio system. It communicates with the rest of the audio/infotainment system on the MOST ring and allows control of the audio system and other infotainment systems from a single point.

The Touch-screen communicates with the IAM on the MOST ring and provides the primary user interface and display of the audio system controls. No configuration procedure is required if the touch-screen is replaced.

Calibration of the Touch-screen using the Jaguar approved diagnostic equipment enables updates to be downloaded as new technology becomes available or any fault concerns require software updates.

The touch-screen provides user control of the following systems:

System	Functions
Audio	Radio display AM/FM or DAB, auxiliary and portable audio, digital TV or CD (compact disc)
Climate control	Air conditioning, distribution, seats, heated steering wheel, automatic air recirculation
Telephone	Digit dialer, phone book, last ten calls (made, received, missed)
Navigation	Destination, stored locations, navigation setup, route options
Vehicle	Security, parking, valet mode, trip computer, clock, brightness, contrast, system settings, vehicle settings, display settings

Integrated Control Panel

E96379

ItemDescription

1	Touch-screen
2	CD load
3	CD load and eject slot
4	Seek up
5	Settings button
6	Audio system on/off and volume control
7	Audio source
8	Seek down
9	Eject

The ICP duplicates many of the touch-screen audio user control features. Any volume setting made whilst in audio, TV, phone, navigation or voice activation mode will be memorized for that system. The ICP communicates with the ICM on the medium speed [CAN](#). The ICM converts control/command signals from the ICP and then distributes the information onto the MOST system to the audio system and other information and entertainment systems.

No configuration procedure is required if the ICP is replaced. There is no option to calibrate the ICP using the Jaguar approved diagnostic equipment.

Steering Wheel Controls

E96380

ItemDescription

1	Volume adjustment
2	Change pre-set radio stations or CD tracks

3 Select audio source

4 Audio mute control/JaguarVoice control

Additional control of the audio system is available in the form of steering wheel mounted switches which are located on the left hand side of the steering wheel. The four switches provide for volume adjustment, change pre-set radio stations or [CD](#) tracks, select audio source and finally audio mute control. The mute control is also used for JaguarVoice control.

The steering wheel audio control switches are hardwired through the clock spring to the ICM. The ICM processes the analogue signals from the switches into digital signals. The digital signals are then passed from the ICM onto the MOST system to control the requested audio functions.

AVC (automatic volume control) controls the audio volume in relation to vehicle speed. As vehicle speed increases the audio level is adjusted to compensate for extra road and vehicle noise. There are three settings for AVC:

- Low
- Medium
- High

Setting of the AVC level is made using the audio controls. The default setting is medium.

The vehicle speed signal is used to enable the ICM to calculate the volume adjustment required. The vehicle speed signal is received over the [CAN](#). The signal is an average of the four wheel speed sensor signals. Should an invalid speed signal be received the AVC will not alter the output volume.

Component Description

INTEGRATED AUDIO MODULE

E96375

The IAM is located in the center console behind the ICP faceplate, and combines the radio tuner and [CD](#) player. The head unit controls which of the two sources is routed to the speakers. All tuner versions have AM/FM reception. Each audio system features auto-store, with a press and hold function to store selected channels as pre-sets. The standard search facility finds the nine strongest channels currently available, while search and manual tuning allow channels to be stored as above.

The Jaguar Sound System IAM uses an internal amplifier which directly drives the system speakers. The Jaguar 320W Premium Sound System and Bowers & Wilkins 440W Surround Sound System differs from the Jaguar Sound System with the addition of an external amplifier. Audio output signals from the IAM are sent on the MOST system to the external amplifier which drives the system speakers.

Depending on audio specification the slot-loading [CD](#) unit is either a single-disc type or six-disc auto-changer. The system automatically detects the [CD](#) format of the source (standard [CD](#), MP3 or WMA files) and offers a full range of options, presenting folders on the touch-screen, listed by albums and tracks, to browse as on a PC. Both versions have mix and repeat functions and the six-disc version displays disc names.

The IAM communicates on the MOST system with the rest of the audio system. If the IAM is replaced it must be configured as a new module using the Jaguar approved diagnostic equipment.

Calibration of the IAM using the Jaguar approved diagnostic equipment enables updates to be downloaded as new technology becomes available or any fault concerns require software updates.

Audio Antennas

E96376

ItemDescription

1	Single TV antenna module
2	RF filter
3	Diversity antenna module
4	Heated rear window
5	Heated rear window upper section
6	Heated rear window lower section
7	Triple TV antenna module
8	RF filter

The diversity antenna module, located on the left hand side of the heated rear window, receives signals from four antennas located in the heated rear window, where one antenna is dedicated as an AM antenna.

The diversity tuning system ensures that the strongest signals are used by the radio system to ensure the best possible FM reception. Using the three remaining receiving antennas serves to eliminate multipath signal distortion. Typically, the signal from the antenna with the least noise is chosen, and the other antennas are ignored.

The diversity antenna module is an interface between the antenna aerials in the heated rear window and audio system modules/tuners. It provides antenna signals to the AM/FM tuner in the IAM, to the DAB receiver and to the VICS (vehicle information and communication systems) or TMC (traffic message channel) in the navigation computer.

There are three different types of diversity antenna module fitted depending on the vehicle market and infotainment equipment specification:

- AM/FM with one co-axial output

- AM/FM and VICS/TMC with two co-axial outputs
- AM/FM, VICS/TMC and DAB band III with three co-axial outputs

The diversity antenna module receives a power supply from the IAM.

Vehicle or other component generated electromagnetic interference may cause unwanted disturbances in the radio and TV reception signals. The disturbance may interrupt, obstruct, or otherwise degrade or limit the effective performance of the circuit. It frequently affects the reception of AM radio in urban areas and can also affect FM radio and television reception, although to a lesser extent.

The RF filters, which act as RF isolators, are located on both sides of the heated rear window and are used to reduce the electromagnetic interference. The left hand side RF filter is connected across the heated rear window power supply and used to separate the DC (direct current) interference from the RF signals. The right hand side RF filter is used in conjunction with the TV antenna module (if fitted). If the TV system is not fitted the filter is linked directly to ground.

INFORMATION CONTROL MODULE

E96377

The ICM is located beneath the IAM in the center console. The unit performs a range of infotainment and some climate-control functions.

The ICM, which is the timing master of the MOST system; supplies clock information to all other devices on the network which synchronize their operation to this clock.

The unit also controls and manages the MOST ring and provides the allocations of channels, system power management, functionality and co-ordination of the other system components.

The system becomes operational when the vehicle is unlocked and a 'wake up' signal is received by the ICM on the medium speed [CAN](#). The ICM 'wakes up' all the control modules on the MOST system ready for immediate operation by the vehicle user.

If the ICM is replaced it must be configured as a new module using the Jaguar approved diagnostic equipment.

Calibration of the ICM using the Jaguar approved diagnostic equipment enables updates to be downloaded as new technology becomes available or any fault concerns require software updates.

PORTABLE AUDIO MODULE

E96381

The portable audio module, located under the left hand front seat, allows for the connection, control and playback of a range of portable audio devices through the car's audio system.

No configuration procedure is required if the portable audio module is replaced. Calibration of the portable audio module using the Jaguar approved diagnostic equipment enables updates to be downloaded as new technology becomes available or any fault concerns require software updates.

E96382

ItemDescription

- | | |
|---|----------------------|
| 1 | iPod connection |
| 2 | USB connection |
| 3 | Auxiliary connection |

The chosen audio device is plugged into the car using the interface panel located in the center console between the front seats. Vehicles with the optional iPod function are supplied with a bespoke iPod lead in the vehicle delivery pack .

A menu option is available through the Touch-screen audio section when selecting a portable audio device for operation through the vehicle audio system.

After the connection of an iPod or USB mass storage device the Touch-screen is used to operate and search the connected device. Due to safety regulations, the normal control interfaces of either the iPod or USB device are disabled when it is plugged into the interface panel.

• NOTE: Some MP3 players have their own file system that is not supported by this system. To use the MP3 player it must be set to USB Removable Device or Mass Storage Device mode. The manufacturer's information should include details of this procedure. Only music that has been added to the device in this mode can be played via the vehicle's portable audio system.

Conversely, connection of any devices through the auxiliary connection cannot be controlled through the touch-screen and are controlled through the device itself.

• NOTE: The system will support devices with a storage capacity up to 256 GB which is approximately 65,000 audio tracks.

The wiring link harness between the portable audio module and interface panel consists of hardwired and digital connections for data and signal exchange. The MOST carries the communication signals and information between the portable audio module to the IAM and touch-screen. Audio output to the speaker system is controlled by the IAM or power

amplifier depending on the audio system specification.

POWER AMPLIFIER

E96383

The audio system has three amplification options dependant on the audio system specification:

- IAM internal amplifier
- Alpine AUD 8
- Alpine AUD 12

The power amplifier is located in the left hand side of the luggage compartment and is connected to the audio system via the MOST bus. Speaker connections are hardwired.

If the power amplifier is replaced it must be configured as a new module using the Jaguar diagnostic equipment.

Calibration of the power amplifier using the Jaguar approved diagnostic equipment enables updates to be downloaded as new technology becomes available or any fault concerns require software updates.

DIGITAL AUDIO BROADCASTING

DAB is a digital radio network designed to provide reliable, multi-service broadcasting for reception by mobile, portable and fixed receivers.

DAB provides a clear signal with minimal interference, hiss or fading. After a channel (or station) has been tuned and stored, it does not need retuning.

• **NOTE:** Radio signals travel in a straight line so large obstacles, such as tall buildings, can shield the vehicle from the signal causing temporary loss of reception (known as dead spots).

Digital radio is transmitted from regional terrestrial transmitters. Some local digital radio channels are not available outside the range of a transmitter. To receive new local channels during vehicle movement around a country, the auto-tune function is used to build new channel lists.

• **NOTE:** When the vehicle DAB radio is first used the system will not receive any digital stations until the auto-tune function has been completed.

Digital radio channels are organized into groups called ensembles (also known as multiplexes). Some individual channels may also provide a number of subchannels. For example, if several sports events are being held simultaneously, the channel may temporarily choose to broadcast each different event on a separate subchannel.

DAB is broadcast across Europe, Canada and parts of Asia. System transmission is via a terrestrial network, on two separate broadcasting bands:

- DAB band-L
- DAB band III

The DAB system requires additional components to be added to the audio system. DAB antennas and a receiver are fitted to allow reception of the service.

Operation of the DAB system is the same as the radio operation with selections made through the touch-screen and ICP to access and navigate the system functions.

The DAB receiver is a dedicated tuner which is controlled by the ICM on the MOST ring. The receiver processes the signals from the DAB antennas. Information is transmitted on the MOST ring and processed by the ICM. The processed information is sent out to the power amplifier or IAM (with internal amplifier) and broadcast through the speaker system.

No configuration procedure is required if the DAB receiver is replaced. Calibration of the DAB receiver using the Jaguar approved diagnostic equipment enables updates to be downloaded as new technology becomes available or any fault concerns require software updates.

Digital Audio Broadcasting Antennas

E96385

ItemDescription

1	Roof pod
2	Diversity antenna module

The DAB band III antenna is located in the heated rear window and is part of the diversity antenna module circuit. The two antenna circuits each have a co-axial connection to the DAB module.

DAB signals are transmitted on either DAB band III (174 - 240 MHz) or DAB band-L (1452 - 1492 MHz). Some countries may only use the band III signals, while others may only use the band-L signals. Some countries use both frequency ranges within the same geographical area. The type of DAB signal received depends on the vehicle market location.

The DAB antennas are designed with 50 ohm output impedance. The DAB receiver is fitted with 50 ohm fakra II connectors to ensure compatibility with the antenna. For optimum performance 50 ohm low loss coaxial cable is used between the antenna and receiver.

SATELLITE RADIO (NAS VEHICLES ONLY)

E96386

The digital radio format adopted for NAS vehicles is satellite radio. Satellite service providers transmit a signal from their up-link facility (which is the original point of transmission of data, voice or other information through an antenna system) to a satellite where the signal is then down linked to both the terrestrial repeater network and the individual satellite car radios. The radio switches between the satellite signal and the repeater network signal depending on the strength of the signal at any given time.

The Sirius satellite system comprises:

- Satellites
- Ground repeaters
- Up-link ground stations
- Radio receiver systems

The Sirius satellite radio system uses three satellites on an inclined elliptical orbit. This ensures that each satellite spends approximately 16 hours a day over the continent of the USA, with at least one satellite over the country at any one time.

The satellites beam their signals down to the ground where the signal is picked up by receivers or is transmitted to repeater stations to cover built up areas where the signal is obscured. The satellite service comprises over 100 channels of digital entertainment which is provided by subscription requiring a monthly payment.

Operation of the satellite radio system is the same as the radio operations with selections made through the Touch-screen and ICP to access and navigate the system functions.

The satellite radio receiver is a dedicated tuner which is controlled by the ICM on the MOST ring. The receiver filters the signals from the satellite radio antenna. Information is transmitted on the MOST ring and processed by the ICM. The processed information is sent out to the power amplifier or IAM (with internal amplifier) and broadcast through the speaker system.

No configuration procedure is required if the satellite radio receiver is replaced. Calibration of the satellite radio receiver using the Jaguar approved diagnostic equipment enables updates to be downloaded as new technology becomes available or any fault concerns require software updates.

Satellite Radio Antenna

E96387

The satellite radio antenna is located in the roof pod and is shared with the navigation system [GPS \(global positioning system\)](#) antenna where fitted. The roof pod is located externally in a central position towards the rear of the roof.

Similar to the DAB system the satellite radio antenna is designed with 50 ohm output impedance. The satellite radio receiver is fitted with 50 ohm fakra II connectors to ensure compatibility with the antenna. For optimum performance 50 ohm low loss coaxial cable is used between the antenna and receiver.

The antenna is designed to receive one of two signals, using the strongest signal with the least distortion to process for audio output. For example, if the vehicle drives into a tunnel, the signal received will change from a satellite signal to a repeater station signal maintaining the strongest signal.

Information and Entertainment System - Speakers - Overview

Description and Operation

Overview

The vehicle has three levels of audio system available:

- Jaguar Sound System
- Jaguar Premium Sound System
- Bowers & Wilkins Surround Sound System

The Jaguar Sound System has 8 speakers, comprising an identical mid-bass and tweeter combination in each door. All speaker domes in this system are of standard textile construction. The speakers are driven directly by the IAM (integrated audio module) internal amplifier.

The Jaguar 320W Premium Sound System has 9 speakers including mid-bass and tweeters in the doors, adding a sub-woofer in the spare wheel well. The speakers are driven by an Alpine AUD 8 amplifier located in the [LH \(left-hand\)](#) side of the luggage compartment.

The Bowers & Wilkins 440W Surround Sound System uses an Alpine AUD 12 amplifier, a Dolby Pro-Logic 2 7.1 Surround Sound System and has 14 speakers. This layout adds a mid-range speaker to each front door while retaining a mid-bass and tweeter in each rear door. It also adds an instrument panel center speaker, 2 surround-effect speakers in the rear parcel shelf, and has the luggage compartment-mounted sub-woofer as the Jaguar 320W Premium Sound System. The speakers are driven by an AUD 12 power amplifier located in the luggage compartment.

The main speakers on the Jaguar 320W Premium Sound System and the Bowers & Wilkins 440W Surround Sound System are identified by the bright yellow Kevlar constructed domes which are visible through the speaker grilles. The tweeter speaker domes are an aluminum construction. The sub-woofer speakers are a textile dome construction.

Information and Entertainment System - Cellular Phone - Overview

Description and Operation

Authoring Template

OVERVIEW

The cellular phone system uses the customers own Bluetooth® capable handset in conjunction with the vehicle information and entertainment system. The telephone control module is located under the left-hand front seat, and has a Bluetooth® antenna integrated into the unit. Telephone handsets must be paired with the telephone control module, requiring input of a PIN (personal identification number) before they can be used with the vehicle system. Once paired, any phone can be docked to the car without re-entering a PIN (personal identification number). In addition to this, the last connected device will dock automatically the next time it is placed in the vehicle and the ignition is in power mode (ignition on).

The system has the ability to pair and dock telephone handsets from the telephones themselves. By supplying a fixed PIN (personal identification number), a user will be able to use their telephone or other telephone related Bluetooth® device and pair with it without using the touch screen. This enables devices such as Blackberry's and other secure PDA's (personal digital assistants) to pair and dock with the vehicle system.

Up to 5 telephone handsets can be paired with the vehicle, but only 1 telephone can be used at a time. The Touch-screen displays phone functionality, including dialing, and (if compatible) the handset's phone book. The Touch-screen also displays the phone's signal strength and battery meter (if supported by the phone). These functions allow the user to view the displays on the Touch-screen and not have to use the handset.

• **NOTE:** There is no physical connection (cradle) between the phone handset and the telephone control module. Communications between the 2 components are purely Bluetooth®. This can limit the available functions dependant on the handset used.

The system allows the driver to make, receive and end phone calls using the Touch-screen, steering wheel switches and voice recognition system (if fitted).

Phone dialing is achieved using one of the following methods:

- Dialing a number using the Touch-screen keypad
- Selecting a number from the handsets (automatically or manually downloaded) phonebook on the Touch-screen
- Selecting a number from the handsets (automatically or manually downloaded) phonebook in the instrument cluster message center
- Selecting from the handsets (downloaded) call register, typically the last 10 calls made, received and missed

The telephone control module is connected to the information and entertainment system on the MOST (media oriented systems transport) ring. This allows audio and control signals to be routed to and from the telephone control module.

Information and Entertainment System - Cellular Phone - System Operation and Component Description

Description and Operation

Control Diagram

5	Microphone
6	Telephone control module
7	Clock spring
8	Steering wheel controls
9	ICM (information control module)
10	Instrument cluster
11	Navigation computer

System Operation

PRINCIPLES OF OPERATION

Primary user control of the phone system is via the Touch-screen and JaguarVoice control switch. Selection of 'phone/comms' on the Touch-screen home menu sends a control signal to the telephone control unit on the MOST (media orientated systems transport) ring, opening the phone submenu options.

When making an outgoing phone call using the JaguarVoice function the ICM (information control module) processes the analogue signal from the switch into a digital signal. The digital signal is passed from the ICM (information control module) onto the MOST (media orientated systems transport) system to the JaguarVoice control unit which is integral with the navigation computer.

The navigation computer sends an instruction via MOST (media orientated systems transport) to the IAM (integrated audio module) to turn on the microphone facility.

The voice command signals are relayed from the IAM (integrated audio module) via the MOST (media orientated systems transport) ring to the navigation computer for processing.

The processed voice command is relayed on the MOST (media orientated systems transport) ring from the navigation computer to the phone control module.

Speech output information is transferred from the phone control module via the Bluetooth® connection to the cell phone.

Incoming calls are received from the Bluetooth® phone by the phone control module. The information is processed by the phone control module and transferred on the MOST (media orientated systems transport) ring to the power amplifier or IAM (integrated audio module) for audio output through the vehicle's audio speaker system.

A number of responses by the telephone and voice systems are reinforced by messages appearing in the instrument cluster message center display. Information is relayed to the message center from the phone control module and navigation computer on the MOST (media orientated systems transport) ring to the ICM (information control module).

The ICM (information control module) is the gateway from the MOST (media orientated systems transport) ring to the medium speed CAN. The ICM (information control module) transfers the message center information onto the medium speed CAN which is received and processed for display on the instrument cluster message center.

Users can pair & dock their handset using their phone or the touch screen. If there is no phone already docked with the system, a user can use their phone to search for Bluetooth Devices. If the vehicle's Bluetooth system has been successfully discovered, the phone will display "Jaguar" as a device to pair & connect to. Using this method requires the user to enter the Jaguar PIN of 1313. Alternatively, after accessing the phone menu from the Touch-screen home menu, selecting 'Search New' searches for the Bluetooth® enabled handsets within range, displays their identities on screen, and allows the user to pair and dock the phone ready for use, using a random four-digit security code displayed on screen. The system will normally try to dock (automatically) to the last phone docked, but if a different Bluetooth® enabled phone enters the car it will become available on the screen's list of handsets once the search has been completed.

Once a phone is paired and docked a digit dial screen is displayed, including phonebook options. With a Bluetooth® compatible handset and software version there is the option, through the settings menu, to automatically download the contents of the handset's phonebook to the vehicle system. Because there is no industry standard for arranging the phonebook, the downloaded lists from individual handsets may vary.

Cell phone handset manufacturers continually update hardware and software to standard specifications laid down by the Bluetooth® Special Interest Group (SIG), which defined how Bluetooth® would work in an automotive environment. However, because different makes and models may use different software, not all handsets are fully compatible with Jaguar, but through testing individual handset models Jaguar has produced a list of compatible handsets and the appropriate software version for Jaguar Bluetooth® connectivity. Referral to the list also describes how to check the software version of each individual cell phone manufacturer. This list must be consulted by users, sales & service teams to confirm whether customer's handsets are compatible or not.

Jaguar is continually validating compatible handset and software combinations. The most up-to-date compatibility list will always be available on-line from Jaguar.

• **NOTE:** To achieve full Bluetooth® handset functionality it is crucial that the phone software level matches the version detailed in the list of compatible handsets.

The upgraded hands free profile of this system allows the display of the network signal strength, network operator and phone battery level indication on the vehicle display. Also, if applicable, the phone handset will show a "car" or "headset" symbol to indicate it is in handsfree profile.

BLUETOOTH®

Bluetooth® is a short-range RF (radio frequency) technology that operates at 2.4 GHz and is capable of transmitting voice and data wirelessly. The effective range of Bluetooth® devices is 32 feet (10 meters) with a data transfer rate of 1 Mbps.

Bluetooth® is essentially a wireless connection which operates with the user's own mobile handset, does not have to be fixed into the car and is designed to function without an external aerial. The handset can be located anywhere within the cabin, even in a bag, or jacket pocket. It could work from the luggage compartment, although the signal could be compromised. The handset can be charged from the 12 volt power socket or USB (if supported) while in use.

Component Description

Touch-Screen

The Touch-screen communicates with the telephone control module on the MOST (media orientated systems transport) ring and provides the primary user interface and display of the phone system.

E96378

ItemDescription

1	Touch-screen
2	Touch-screen on/off button
3	Home menu button

The following functions are available on the phone menu:

- Digit dial
- Phone book
- Last ten calls (made, received, missed)
- Voicemail

Steering Wheel Controls

E96380

ItemDescription

1	Volume adjustment
2	Scroll up/down to next/previous memory location.
3	Audio source (Long press for instrument cluster message center phonebook access)
4	JaguarVoice button. Briefly press to initiate or end a call. This is also used for voice control functions

Additional control of the phone system is available in the form of steering wheel mounted switches which are located on the left hand side of the steering wheel. The switches provide for volume adjustment, scroll up/down to next/previous memory location, instrument cluster message center phonebook access and finally JaguarVoice/call control.

The steering wheel control switches are hardwired through the clock spring to the ICM (information control module). The ICM (information control module) processes the analogue signals from the switches into digital signals. The digital signals are then passed from the ICM (information control module) onto the MOST (media orientated systems transport) system for control unit processing and operation of the requested functions.

JaguarVoice

JaguarVoice enables activation of several voice activated functions of the infotainment and climate control systems without the need to touch any controls manually. The following systems include JaguarVoice functionality;

- Navigation system
- Phone system
- Climate control system
- Vehicle display system

- Vehicle notepad

The 'notepad' facility allows voice notes to be recorded. Nametags for phone dialing and navigation locations allow the system to be personalized and there is a help and tutorial function to provide advice on using the system.

The system allows the vehicle user to concentrate fully on driving the vehicle, without any need to divert their eyes from the road ahead in order to check information read outs on the vehicle instrument panel information units. The voice control system also feeds back audible information to the vehicle user.

JaguarVoice is a key component of the phone system, allowing hands free control and use of the Bluetooth® enabled phone.

The system is controlled by the voice button on the left hand side of the steering wheel. Voice commands are picked by the dedicated microphone. When giving a voice command audible feedback will be heard through the vehicle's audio speakers. Received call voice/speech is also broadcast on the vehicle audio speaker system. All speakers are used for voice/speech output with the exception of the front center speaker (only fitted on the Bowers & Wilkins 440W Surround Sound System) due to echo return picked up by the microphone.

E96496

ItemDescription

1 JaguarVoice button

Efficient operation of JaguarVoice is reliant on the user understanding some of the following basic operating conditions;

- Face forwards, sitting in a normal driving position
- After pressing the voice button, always wait for the end of the audible tone before speaking.
- Speak naturally, as if you were talking to a passenger or on the phone without pausing between words
- When the system asks for more information, always wait for the end of the tone before responding
- Always say numbers correctly
- Excessive noise, for example while driving with windows open, may cause voice command mis-recognition. If it is too noisy to use the phone, it is likely that voice commands will not be recognized

Most accents are understood without difficulty, but if the system does not recognize the command it will respond "SORRY" and allow two more attempts to say the command.

Voice feedback is given in the same language as the command recognition. It is possible to change the language of the speech control system.

Information and Entertainment System - Navigation System - Overview

Description and Operation

Authoring Template

OVERVIEW

The navigation system provides audible and visual route guidance information to enable the driver to reach a desired destination. The system allows the driver to choose the desired route using minor or major roads and will present 3 routes to the driver based on user preferences. Directions to hospitals, museums, monuments and hotels are also available. The navigation computer uses map information stored on a DVD (digital versatile disc) to determine the best route for the journey and provide the driver with details of directions and approaching junctions.

The navigation system has various levels of user control through the Touch-screen and JaguarVoice system. System volume adjustment can be made using the ICP (integrated control panel), Touch-screen and steering wheel controls.

There are 3 navigation system variants specific to various markets. On all systems the GPS (global positioning system) signal is received by the GPS (global positioning system) antenna located in the roof pod antenna module.

The European navigation system includes the TMC (traffic messaging channel) function, which receives traffic information from an FM antenna integrated into the heated rear window. On a pre-selected route the system will offer re-routing options depending on traffic conditions.

The Japanese navigation system includes the VICS (vehicle information and communication systems) function. The VICS (vehicle information and communication systems) supplies information to enable the navigation computer to re-route the navigation guidance or to inform the vehicle driver of traffic conditions in the vehicles vicinity. Information is provided to the system through an FM antenna integrated into the heated rear window and a VICS beacon located in the LH upper side of the instrument panel.

The NAS (North American specification) variant does not include any additional traffic information systems.

The navigation system is primarily controlled from the Touch-screen which is located in the center of the instrument panel. Control signals from the Touch-screen are sent on the MOST (media oriented systems transport) ring to the navigation computer. The navigation computer uses a dedicated GVIF (gigabit video interface) bus to transmit video signals to the Touch-screen.

Depending upon the audio system version fitted the navigation audio output signals are sent on the MOST (media oriented systems transport) ring to the IAM (integrated audio module) or the power amplifier for speaker output.

INTRODUCTION TO THE GLOBAL POSITIONING SYSTEM

The system used to calculate the current position of the vehicle is called the [GPS](#). The system utilizes satellites which are owned by the United States Department of Defense. A total of 24 satellites circular orbit the earth every 12 hours at a height of 20,000 km (12500 miles), and between 5 and 11 of these satellites can be seen from a single point at any given time. The orbits are tilted to the earth's equator by 55 degrees to ensure coverage of polar regions. Each satellite transmits radio signals to provide information about the satellite position i.e. latitude, longitude, altitude, almanac data and an accurate time signal generated by an on-board atomic clock. Each satellite contains four atomic clocks.

The vehicle needs to receive data from at least four different satellites to give a three dimensional fix on its current position.

As the vehicle moves, this information is continually being updated. The computer determines which satellites are 'visible' to the system and their current position and relationship to each other. Using this information the computer can account for positional deviations of the satellites and compensate to enhance the accuracy of the navigation system.

E51822

The [GPS](#) signal is also known as the PPS (precision positioning signal).

PPS (precision positioning signal) predictable accuracy is:

- 22 meters horizontal accuracy
- 27.7 meters vertical accuracy
- 200 nanoseconds time accuracy

The navigation system receives [GPS](#) information via the [GPS](#) antenna. The [GPS](#) signals are used by the navigation computer to calculate the vehicles position. Once the driver has input a desired destination the navigation computer can calculate a route, based on the driver's pre-determined preferences or the default settings in the navigation computer.

The navigation system is accessed from the Touch-screen home menu.

Navigation is initiated by the driver inputting a destination. This can be achieved by:

- Entering an address using the Touch-screen
- Entering a post code
- Choosing a previous destination
- Choosing a point of interest from the map disc database
- Choosing the home location
- Choosing a memory stored location

The driver is then guided to the destination by a scrolling map display and voice guidance. The display can be varied by scale and display type.

In addition to the standard navigation system there are two market dependant systems that supply extra information to the navigation system and the driver. These are:

- TMC (traffic message channel) (Europe only)
- VICS (vehicle information and communication system) (Japan only)

The TMC (traffic message channel) is a function of the [FM \(frequency modulation\)RDS \(radio data system\)](#). The system broadcasts real-time traffic and weather information. Data messages are received and decoded by the TMC (traffic message channel) integral receiver and processed by the navigation computer. TMC (traffic message channel) messages can be filtered by the navigation computer so that only those relevant to the current journey are displayed, allowing the navigation system to offer dynamic route guidance - alerting the driver of a problem on the planned route and calculating an alternative route to avoid the incident. All TMC (traffic message channel) events on the map can be viewed not just the ones on the calculated route.

TMC (traffic message channel) traffic information systems conform to a global standard that has been adopted by traffic data gatherers, information service providers, broadcasters and vehicle/receiver manufacturers.

All TMC (traffic message channel) receivers use the same list of event codes, while the location database (on the map disc) contains both a country-specific set of location codes for the strategic European road network.

TMC (traffic message channel) traffic data is currently broadcast in many European countries.

The VICS (vehicle information and communication system) is broadcast in the Japanese market.

The VICS (vehicle information and communication system) supplies information to enable the navigation computer to re-route the navigation guidance or to inform the vehicle driver of traffic conditions in the vehicles vicinity. Information is provided to the system through 3 routes:

- RF (radio frequency) transmission
- Infra-red transmission
- [FM](#) multiplex transmissions

The RF (radio frequency) transmissions are generally transmitted from road side beacons mainly on expressways. The information transmitted is as follows:

- Traffic congestion
- Travel time to next intersection
- Traffic conditions in surrounding areas and expressway turn offs
- Traffic accidents
- Speed limits
- Lane regulations
- Tire change
- Parking availability at expressway service areas and parking areas

Infra-Red transmissions are transmitted from road side beacons on major trunk roads. The information transmitted is:

- Traffic congestion and travel time
- Traffic accidents
- Breakdowns
- Road works restrictions
- Parking availability

[FM](#) transmissions are broadcast as part of the [FM](#) multiplex broadcasting system from NHK [FM](#) stations. Information transmitted is:

- Traffic congestion and travel time for wide areas
- Traffic accidents, road works, speed limits and lane restrictions for a wide area
- Parking availability information

The traffic data is split from the normal [FM](#) transmissions by the diversity antenna module.

Selection of 'Navigation' on the Touch-screen home menu and subsequent sub-menu selection sends a control request signal to the navigation computer on the MOST (media orientated systems transport) ring. The requested control information is processed by the navigation computer.

If voice guidance is operational the voice signal information is relayed from the navigation computer on the MOST (media orientated systems transport) ring to either the IAM (integrated audio unit) or Power Amplifier, dependant on equipment level, for output on the speaker system. The navigation audio output is through the front speakers whilst the background audio, for example radio or [CD \(compact disc\)](#), is played at a reduced volume on the rear speakers.

The [GPS](#) signal is available to the navigation system at all times when the vehicle ignition is switched on.

Navigation user voice commands are made using the JaguarVoice system. The ICM (information control module) processes the analogue signal from the JaguarVoice switch into a digital signal. The digital signal is passed from the ICM (information control module) onto the MOST (media orientated systems transport) system to the JaguarVoice control unit which is integral with the navigation computer.

The navigation computer sends an instruction via the MOST (media orientated systems transport) ring to the IAM (integrated audio module) to turn on the microphone facility.

The microphone is hardwired to the IAM (integrated audio module). The spoken voice command signals are relayed from the IAM (integrated audio module) via the MOST (media orientated systems transport) ring to the navigation computer for processing.

The processed voice command is relayed from the navigation computer to the Touch-screen.

Traffic data from TMC (traffic message channel) or VICS (vehicle information and communication system) is processed by the navigation computer, distributed to the Touch-screen with any supporting voice instruction relayed through the MOST (media orientated systems transport) ring to either the IAM (integrated audio unit) or Power Amplifier, dependant on equipment level, for output on the speaker system.

A number of actions, when using the navigation voice system, are reinforced by messages appearing in the instrument cluster message center display. Information is relayed to the message center from the navigation computer on the MOST (media orientated systems transport) ring to the ICM (information control module).

The ICM (information control module) is the gateway from the MOST (media orientated systems transport) ring to the medium speed [CAN \(controller area network\)](#). The ICM (information control module) transfers the message center information onto the medium speed [CAN](#) which is received and processed for display on the instrument cluster message center.

Component Description

NAVIGATION COMPUTER

The navigation computer is located in the left hand side of the luggage compartment.

E96571

The navigation computer incorporates the following:

- [GPS](#) receiver
- VICS (vehicle information and communication system) receiver (Japan only)
- TMC (traffic message channel) receiver (Europe only)
- JaguarVoice control module

The navigation computer contains a solid state piezo gyro which measures the motion of the vehicle around its vertical axis. The gyro operates on the principle known as the coriolis force. The coriolis force is the force that appears to accelerate a body moving away from its rotational axis against the direction of rotation of the axis.

Using inputs from the [ABS](#) module, the [GPS](#) antenna and the gyro sensor, the computer calculates the vehicle's current position, direction and speed.

The navigation computer houses the [DVD \(digital versatile disc\)](#) drive. The drive is used to read map data from region specific [DVD](#)'s. The number of [DVD](#)'s issued per region varies depending on the amount of information available. The regions are as follows:

- Europe (2 versions, Western Europe and Whole of Europe)
- NAS (North American specification)
- Japan, Middle East, Australia and South Africa

A button, located adjacent to the [DVD](#) slot, is provided to eject the [DVD](#) from the unit. Prior to ejecting the disc the slot protection has to be slid to the side. If the ignition is on, or the entertainment system is in 1-hour mode, one press of the button will eject the [DVD](#).

The navigation computer uses non-volatile memory to store settings and configuration information when it is powered down. This process takes place just before the computer turns off.

No configuration procedure is required if the navigation computer is replaced. There is no option to calibrate the navigation computer using the Jaguar approved diagnostic equipment; however in some regions a software download, contained in the [DVD](#) disc, is required before the navigation system becomes operational.

MICROPHONE

E96495

A single microphone is used for hands-free operation using the JaguarVoice system. The microphone has an integrated noise suppression system for hands-free use. The microphone is a standard directional type and is located in the front roof overhead console. The microphone is hardwired to the IAM (integrated audio module). When replacing the microphone extra care must be taken to make sure it is fitted into its securing clips for correct positioning and orientation.

GPS Antenna

E96387

The [GPS](#) antenna passes signals from the [GPS](#) satellites to the navigation computer for processing. The antenna is located in the roof pod and is shared with the DAB (digital audio broadcasting) band L antenna or satellite radio antenna where fitted. The roof pod is located externally in a central position towards the rear of the roof.

The [GPS](#) antenna is designed with 50 ohm output impedance. The navigation computer is fitted with 50 ohm fakra II connectors to ensure compatibility with the antenna. For optimum performance 50 ohm low loss coaxial cable is used between the antenna and navigation computer.

It is possible for the [GPS](#) antenna to lose the signal from the [GPS](#) satellites;

- In hilly or tree lined areas
- Built up areas with tall buildings
- In multi storey car parks
- In garages
- In tunnels
- On bridges
- During heavy rain or thunderstorms

When the signal is lost the navigation computer will continue to give guidance using memory mapped data from the [DVD](#) map until the signal is restored.

TMC/VICS FM Antenna

Data messages for both TMC (traffic message channel) and VICS (vehicle information and communication system) are received through the [FM](#) antennas and diversity antenna module located in the heated rear window.

VICS Beacon Antenna (Japan Only)

E96572

The VICs (vehicle information and communication system) beacon antenna receives infra red and RF (radio frequency) traffic data signals from road side transmitters. The antenna is connected to the navigation computer which incorporates a VICs (vehicle information and communication system) receiver.

Touch Screen Display

E73867

The Touch-screen is the control interface for the following vehicle systems;

System	Functions
Audio	Radio display AM/FM or DAB (digital audio broadcast), auxiliary and portable audio, digital TV or CD
Climate control	Air conditioning, distribution, seats, heated steering wheel, automatic air recirculation
Telephone	Digit dialer, phone book, last ten calls (made, received, missed)
Navigation	Destination, stored locations, navigation setup, route options
Vehicle	Security, parking, valet mode, trip computer, clock, brightness, contrast, system settings, vehicle settings, display settings

The screen is a touch sensitive 7 inch LCD (liquid crystal display) VGA screen containing 800 x 480 pixels in a 15:9 format. The screen processes its own video for system operation but receives the navigation graphics from the navigation computer.

Steering Wheel Controls

E96380

ItemDescription

1	Volume adjustment
2	Scroll wheel (No navigation functionality)
3	Audio source (No navigation functionality)

4 JaguarVoice control

Additional control of the navigation system is available in the form of steering wheel mounted switches which are located on the left hand side of the steering wheel. 2 switches are used for navigation functions;

- Volume adjustment
- JaguarVoice control

JaguarVoice enables operation of several voice activated functions of the infotainment and climate control systems without the need to touch any controls manually. The following systems include JaguarVoice functionality;

- Navigation system
- Phone system
- Climate control system
- Vehicle display system
- Vehicle notepad

The 'notepad' facility allows voice notes to be recorded. Nametags for phone dialing and navigation locations allow the system to be personalized and there is a help and tutorial function to provide advice on using the system.

The system allows the vehicle user to concentrate fully on driving the vehicle, without any need to divert their eyes from the road ahead in order to check information read outs on the vehicle instrument panel information units. The voice control system also feeds back audible information to the vehicle user.

JaguarVoice is a key component of the navigation system, allowing hands free control when issuing navigation commands.

The system is controlled by the voice button on the left hand side of the steering wheel. Voice commands are picked up by a dedicated microphone. When giving a voice command audible feedback will be heard through the vehicle's audio speakers.

E96496

ItemDescription

- 1 JaguarVoice button

Efficient operation of JaguarVoice is reliant on the user understanding some of the following basic operating conditions;

- Face forwards, sitting in a normal driving position
- After pressing the voice button, always wait for the end of the tone before speaking.
- Speak naturally, as if you were talking to a passenger or on the phone without pausing between words
- When the system asks for more information, always wait for the end of the tone before responding
- Always say numbers correctly
- Excessive noise, for example while driving with windows open, may cause voice command mis-recognition. For example if it is too noisy to use the phone, it is likely that voice commands will not be recognized.

Most accents are understood without difficulty, but if the system does not recognize the command it will respond "SORRY" and allow two more attempts to say the command.

Voice feedback is given in the same language as the command recognition. It is possible to change the language of the speech control system.

9	TV (television) tuner
10	RF filter
11	ICM (information control module)
12	Steering wheel remote controls

Information and Entertainment System - Video System - Overview

Description and Operation

OVERVIEW

The Television system combines digital and analogue reception. The digital element is similar to the home based freeview system, and displays information such as current channel detail. The Japanese market uses the analogue signal as the digital format is not compatible.

For legal reasons, the Touch-screen Television image can only be displayed when the vehicle is at rest, however the system is configured not to constantly switch on and off in stop-start traffic. It is possible to listen to Television sound as the vehicle is moving.

2	TV (television) tuner
3	Touch-screen
4	Microphone
5	IAM (integrated audio module)
6	Speakers
7	Power amplifier
8	Clock spring
9	Steering wheel remote controls
10	ICM (information control module)

11 ICP (integrated control panel)
12 Single TV (television) antenna module

System Operation

The Television system has various levels of user control through the Touch-screen, ICP (integrated control panel) and steering wheel control panel. The system includes nine analogue and nine digital channel pre-sets. As with the audio system, the user can search up or down and store by a long press of the selected channel button. The system offers a choice of screen aspect ratios similar to a typical domestic receiver, giving options between the standard 4:3 format, wide screen 16:9 format and zoom to fill the screen.

To provide the strongest possible signal the Television tuner receives signals from 4 antenna sources located in the heated rear window. Unlike domestic systems this system gives a more progressive picture loss if the signal is lost. The signal loss is indicated to the user by a 'loss of reception' screen message.

The Television system is primarily controlled from the Touch-screen and the ICP (integrated control panel) which are located in the center of the instrument panel. Control signals from the Touch-screen display are sent on the MOST (media oriented systems transport) ring to the Television tuner. The Television tuner uses a dedicated CVBS (composite video signal) bus to transmit video signals to the Touch-screen.

Control signals from the ICP (Integrated control panel) are relayed on the medium speed CAN bus to the ICM (information control module). The ICM (information control module) relays the control signals to the Television tuner on the MOST (media oriented systems transport) ring. The ICM (information control module) is the timing master for the MOST (media oriented systems transport) ring and also hosts a gateway function between the medium speed CAN bus and the MOST (media oriented systems transport) ring.

Depending upon the audio system version fitted the Television tuner audio output signals are sent on the MOST (media oriented systems transport) ring to the IAM (integrated audio module) or the power amplifier for speaker output.

Component Description

TELEVISION TUNER

E96676

The television tuner is a DVB-T (digital video broadcasting - terrestrial) receiver and consists of a 'front end' which is made up of a tuner and a demodulator. Following pre-filtering, the tuner converts the signal from the antenna to an intermediate frequency. In the demodulator, the signal is first converted to a basic frequency, so that a signal from a transponder can be forwarded to the MPEG decoder as a transport stream. The transport stream usually contains several television channels along with relevant auxiliary services such as teletext, subtitles and electronic program guides.

- **NOTE:** Not all digital features such as text and programme listings are currently available.

Control signals from the Touch-screen display are sent on the MOST (media oriented systems transport) ring to the television tuner. The television tuner uses the dedicated CVBS (composite video signal) bus to transmit its video signals to the Touch-screen. The CVBS (composite video signal) system utilizes a single wire transmission system and is limited in bandwidth to less than 6MHz.

No configuration procedure is required if the television tuner is replaced. Calibration of the television tuner using the Jaguar approved diagnostic equipment enables updates to be downloaded as new technology becomes available or any fault concerns require software updates.

Television Antennas

E96376

ItemDescription

1	Single TV (television) antenna module
2	RF filter
3	Diversity antenna module
4	Heated rear window
5	Heated rear window upper section
6	Heated rear window lower section
7	Triple TV (television) antenna module
8	RF filter

The television tuner receives digital and analogue television signals through 4 antennas located in the heated rear window. 3 of the antennas are connected to the triple antenna amplifier/module located on the RH (right-hand) side of the heated rear window. A fourth antenna is connected to the single antenna amplifier/module located on the LH (left-hand) side of the heated rear window.

The combination of signals from several antennas is known as 'diversity' reception. For example using two or more antennas can reduce the signal error rate by 50%, which is of critical importance for mobile receivers.

Vehicle or other component generated electromagnetic interference may cause unwanted disturbance in the television reception signals. The disturbance may interrupt, obstruct, or otherwise degrade or limit the effective performance of the circuit.

Double coil RF (radio frequency) filters, which act as RF (radio frequency) isolators, are located on both sides of the heated rear window and are used to reduce any electromagnetic interference. The LH side RF (radio frequency) filter is connected across the heated rear window power supply and used to separate the DC (direct current) interference from the RF (radio

frequency) signals. The positive filter is present on all vehicle types and markets.

The right hand side double coil RF (radio frequency) filter is only used in conjunction with the television antenna modules and is connected across the heated rear window ground circuit. If a television system is not fitted a filter is used which is linked directly to ground.

Touch-Screen

E96378

ItemDescription

1	Touch-screen
2	Touch-screen on/off button
3	Home menu button

The Touch-screen is the primary user interface for the television system. From the 'Home' screen menu television is a sub-menu of 'Audio'. The Touch-screen communicates with the television tuner. Video signals to the Touch-screen are transmitted from the television tuner.

Integrated Control Panel

E96677

ItemDescription

1	Touch-screen
2	Seek up button
3	Settings button
4	On/off and volume control
5	Source button
6	Seek down button

The ICP (integrated control panel) duplicates many of the Touch-screen television user control features. The ICP (integrated control panel) communicates with the television system through the medium speed [CAN](#) and MOST (media orientated systems transport) bus systems.

Steering Wheel Controls

ItemDescription

1	Volume adjustment
2	Change pre-set TV (television) stations
3	Select source
4	Audio mute control/JaguarVoice control

Additional control of the television system is available in the form of steering wheel mounted switches which are located on the left hand side of the steering wheel. The 4 switches provide for volume adjustment, change pre-set television stations, select media source and finally audio mute control. The mute control is also used for JaguarVoice control.

Exterior Lighting - Exterior Lighting - Overview

Description and Operation

OVERVIEW

The lighting systems are controlled by the [EJB \(engine junction box\)](#), [RJB \(rear junction box\)](#) and the [CJB \(central junction box\)](#). The two boxes contain fuses, relays and microprocessors to control the power supply and functionality of the lighting systems.

Driver lighting selections using the [LH \(left-hand\)](#) steering column multifunction switch or the auxiliary lighting switch are passed to the [CJB](#) via the instrument cluster.

The lighting system has an 'auto' lights function which is controlled by the [CJB](#) on receipt of signals from the rain/light sensor located at the top of the windscreen. The exterior lights are turned on or off in response to ambient light signals from the rain/light sensor on a [LIN \(local interconnect network\)](#) bus connection to the [CJB](#). The auto lights can also be activated when the windshield wipers are activated by signals from the rain sensor, which is located at the top of the windshield or when the driver activates the wipers in the fast wipe position.

Two levels of headlamp specification are available; halogen or xenon. In certain markets the headlamps feature a cornering lamp or a static bending lamp which illuminates the area at the side of the vehicle when turning into driveways for example. North American Specification (NAS) vehicles have a side marker lamp installed in the headlamp assembly. Replacement of any of the headlamp bulbs requires removal of the headlamp assembly.

The tail lamp comprises two separate lamp assemblies. The turn signal indicator, side and stop lamps and reverse lamps are located in each rear fender tail lamp assembly. The rear fog lamps are located in separate units attached to the luggage compartment lid. A side marker lamp is fitted to the rear fender tail lamp assembly and is fitted in all markets.

Two systems of headlamp leveling are available; manual leveling which is only available on halogen headlamps and static dynamic leveling which is available on xenon headlamps. The manual system uses a thumbwheel rheostat to adjust the vertical alignment of the headlamps to compensate for differing vehicle loading. The static dynamic system uses height sensors fitted to the front and rear suspension and a headlamp leveling module which periodically monitors the vehicle attitude and adjusts the headlamp vertical alignment accordingly.

System Operation

CENTRAL JUNCTION BOX (CJB) AND REAR JUNCTION BOX (RJB)

The [CJB](#) is an integrated unit which controls body functions and power distribution. The [CJB](#) is located on the [RH](#) 'A' pillar.

The [RJB](#) also controls body functions and power distribution and is located in the [RH](#) side of the luggage compartment.

Central Junction Box

The [CJB](#) receives inputs from the following switches via the instrument cluster and the medium speed [CAN](#) bus:

- [LH](#) Steering column multifunction switch
 - Side lamp position
 - Headlamp position
 - Automatic (AUTO) position
 - Timer delay positions
 - Turn signal indicators
 - Headlamp flash and main beam positions.

The [CJB](#) receives direct inputs from the following components:

- Stop lamp switch
- Rain/light sensor.

The [CJB](#) provides power supplies to the following lamps:

- [LH](#) and [RH](#) front side lamps
- [LH](#) and [RH](#) front side marker lamps (if fitted)
- [LH](#) and [RH](#) static bending lamp (if fitted)
- [LH](#) and [RH](#) low beam headlamp
- [LH](#) and [RH](#) high beam headlamp.

Rear Junction Box

The [RJB](#) provides power supplies to the following lamps:

- [LH](#) and [RH](#) tail lamps
- [LH](#) and [RH](#) stop lamps
- [LH](#) and [RH](#) front turn signal indicators
- [LH](#) and [RH](#) rear turn signal indicators
- [LH](#) and [RH](#) licence plate lamps
- [LH](#) and [RH](#) side marker lamps
- High mounted stop lamp
- Rear fog lamps
- Reverse lamps.

The [RJB](#) also provides a power supply to the [LH](#) and [RH](#) door modules. The door modules use the power supply to activate the turn signal indicator side repeater lamps located in the door mirrors, on receipt of a medium speed [CAN](#) bus message from the [RJB](#).

Circuit Protection

The [CJB](#) and the [RJB](#) provide circuit protection for their respective lighting circuits. The exterior lighting circuits are protected by Field Effect Transistors (FET's). The FET's can detect overloads and short circuits and respond to heat generated by increased current flow caused by a short circuit.

On a normal conventionally protected circuit this would cause a fuse to blow. The FET's respond to the heat increase and disconnect the power supply to the affected circuit. When the fault is rectified or the FET has cooled, the FET will reset and operate the circuit normally. If the fault persists the FET will cycle, disconnecting and reconnecting the power supply.

The [CJB](#) and the [RJB](#) store fault codes which can be retrieved using a Jaguar approved diagnostic system. The fault code will identify that there is a fault on a particular output circuit which will assist with fault diagnosis and detection.

Alarm Indications

The exterior lighting system is used for alarm arm and disarm requests to show alarm system status.

When the driver locks and arms the vehicle, a visual indication of a successful lock and arm request is displayed to the driver by a single flash of the hazard flashers. If the vehicle is superlocked, then the hazard flashers will flash a second time (200 ms off and 200 ms on) to confirm the superlock request.

If the alarm is activated, the hazard flashers are operated for 10, 30 second cycles of 200 ms on and 200 ms off, with a 10 second delay between each cycle.

• NOTE: On North American Specification (NAS) vehicles, the delay between the cycle when the alarm is activated is 60 seconds.

Lights on Warning

When the ignition is in the off power mode 0 or accessory power mode 4 and the lighting control switch is in the side lamp or headlamp position, a warning chime will sound if the driver's door is opened. This indicates to the driver that the exterior lights have been left switched on.

The chime is generated from the instrument cluster sounder on receipt of a lights on signal, a driver's door open signal and an ignition off power mode 0 or accessory power mode 4 signal via a medium speed [CAN](#) bus signal from the [CJB](#).

Headlamp Timer

The [RJB](#) controls the headlamp timer function which allows the headlamps to remain on for a period of time after leaving the vehicle. This is a driver convenience feature which illuminates the driveway after leaving the vehicle.

To operate the timer function the lighting control switch must be in one of the three headlamp timer positions when the ignition status is changed from ignition on power mode 6 to the off power mode 0. The timer function will then be initiated and the low beam headlamps will be illuminated for the selected timer period.

• NOTE: If the lighting switch is in the AUTO position, the headlamp timer will not function when the ignition is changed to off power mode 0.

When the lighting control switch is in the autolamp exit delay position, the lighting control switch reference voltage flows through 4 of the resistors. The returned signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [RJB](#) that autolamps has been selected.

Depending on the selected exit delay position, the reference voltage to the autolamp exit delay switch is routed through 3, 2 or 1 resistors which is detected by the instrument cluster. The cluster outputs a message on the medium speed [CAN](#) bus to the [RJB](#) that autolamp exit delay period has been selected at 30, 60 or 120 seconds respectively.

Crash Signal Activation

When a crash signal is transmitted from the [RCM \(restraints control module\)](#), the [RJB](#) activates the hazard flashers. The hazard flashers continue to operate until the ignition is in the off power mode 0 or accessory power mode 6. Once this ignition state has occurred, the [RCM](#) will cease to transmit the crash signal.

LIGHTING CONTROL SWITCH

The instrument cluster outputs 2 reference voltages to the rotary lighting control switch; one feed being supplied to the light selection function of the switch and the second feed being supplied to the auto headlamp exit delay function. The switch position is determined by instrument cluster by the change in returned signal voltage which is routed through up to 4 resistors in series depending on the selection made.

OFF - When the lighting control switch is in the off position, the reference voltage flows through 1 of the resistors. The returned signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that no lighting selection is made. The reference voltage to the auto headlamp exit delay switch is routed through 4 resistors which is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that auto headlamp or exit delay has not been selected.

SIDE LAMPS - When the lighting control switch is in the side lamp position, the reference voltage flows through 2 of the resistors. The returned signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) to activate the side lamps. The reference voltage to the autolamp exit delay switch is routed through 4 resistors which is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that auto headlamp or exit delay has not been selected.

HEADLAMPS - When the lighting control switch is in the headlamp position, the reference voltage flows through 3 of the resistors. The returned signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) to activate the headlamps. The reference voltage to the auto headlamp exit delay switch is routed through 4 resistors which is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that auto headlamp or exit delay has not been selected.

AUTOLAMPS - When the lighting control switch is in the auto headlamp position, the reference voltage flows through 4 of the resistors. The returned signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) to activate the autolamp function. The reference voltage to the autolamp exit delay switch is routed through 4 resistors which is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that auto headlamp has been selected.

AUXILIARY LIGHTING SWITCH

Headlamp Leveling Rotary Thumbwheel (Halogen headlamps only)

A power supply is passed to the headlamp leveling thumbwheel from the ignition relay in the [EJB](#). Depending on the position of the thumbwheel, the voltage passes through 1, 2 or 3 resistors connected in series. The voltage through the resistors is passed to the headlamp leveling motor controller in each headlamp. The received voltage is determined as a request for the appropriate level position and the controller powers the headlamp level motors to the applicable position for each headlamp.

Rear Fog Lamp Switch

The instrument cluster supplies a reference voltage and return to the rear fog lamp switch. The fog lamp switch is a non-latching, momentary switch.

When the fog lamp switch is off the reference voltage is passed through a 1Kohm resistor. The voltage through the resistor is returned to the instrument cluster that determines that no request for fog lamp operation has been made.

When the driver presses the fog lamp switch, the reference voltage is passed through a 330 ohm resistor. The change in return voltage is sensed by the instrument cluster which determines fog lamp operation has been requested. The instrument cluster transmits a medium speed CAN bus signal to the RJB providing the lighting control switch is in the correct position. The RJB reacts to the message and provides a power supply to the 3 LED (light emitting diode)'s in each rear fog lamp. A fog lamp warning lamp in the instrument cluster will also be illuminated when the fog lamps are operating.

The RJB will only activate the rear fog lamps if the headlamps are selected on or are active with auto headlamp activation. When the headlamps are turned off the fog lamps are also turned off. When the headlamps are next switched on, the fog lamps will not be activated until the driver requests fog lamp operation.

- NOTE: The fog lamps do operate when DRL (daytime running lamps) are active.

HEADLAMP LEVELING

Manual Headlamp Leveling - Halogen headlamps only

A power supply is passed to the headlamp leveling motor in each headlamp from the ignition relay in the EJB. When a signal voltage is received from the headlamp leveling rotary thumbwheel, the headlamp leveling motor controller in each headlamp uses the power supply to operate the motors and move the headlamp to the requested position.

Static Dynamic Headlamp Leveling - Xenon headlamps only

The headlamp leveling module receives a power supply from the ignition relay in the EJB. The same power supply is also supplied to the headlamp leveling motor in each headlamp assembly. The front and rear height sensors are connected to the headlamp leveling module and receive a power and ground from the module. Each sensor has a signal line to the headlamp leveling module to return height information to the module. The module uses the height signals from the sensors to calculate the vehicle attitude and supplies a signal to each motor to power the headlamp to the required position.

Component Description

EXTERIOR BULB TYPE/RATING

The following table shows the bulbs used for the exterior lighting system and their type and specification.

- NOTE: The tail lamps, side marker lamps, stop lamps, high mounted stop lamp and rear fog lamps are illuminated by LED's and are non-serviceable components.

Bulb	Type	Rating
Halogen headlamp - Projector module low/high beam - Not NAS	H7	55W
Halogen headlamp - Projector module low/high beam - NAS only	H11	60W
Xenon headlamp - Projector module low/high beam - All markets	D1S	35W
High beam only (halogen) - High/low beam (xenon) - All markets	H7	55W
Front side lamps - all markets	W5W Halogen cool blue (HCB)	5W
Front turn signal indicators - Not NAS	PY21W	21W
Front turn signal indicators - NAS only	3457AK	27W
Rear turn signal indicators - All markets	PSY19W	19W
Turn signal indicator side repeaters - All markets	WY5W	5W
Reverse lamps - All markets	PS19W	19W
Licence plate lamps - All markets	W5W	5W

LIGHTING CONTROL SWITCH

E82943

ItemDescription

- | | |
|---|--------------|
| 1 | Off position |
|---|--------------|

2	Side lamp position
3	High beam position
4	RH turn signal indicator
5	Headlamp flash/high beam off position
6	LH turn signal indicator
7	Headlamp position
8	AUTO headlamp position
9	Headlamp timer 120 second delay position
10	Headlamp timer 60 second delay position
11	Headlamp timer 30 second timer delay position

The lighting control switch is located on the [LH](#) steering column multifunction switch. The lighting control switch is a rotary control with positions for the following lighting functions:

- Off
- Side lamps
- Headlamps
- AUTO headlamps
- Headlamp timer (3 time period selections).

The [LH](#) steering column multifunction switch also provides for the following functions:

- Low beam headlamps
- High beam headlamps
- Headlamp flash
- [LH](#) and [RH](#) turn signal indicators
- Trip computer function button.
Refer to: Information and Message Center (413-08 Information and Message Center, Description and Operation).

The switch has a turn signal indicator lane change function. If the switch is gently pushed to either turn signal indicator position and then released, the applicable turn signal indicators will flash 3 times and then will be automatically cancelled. If a turn signal indicator bulb fails, the green turn signal warning indicator in the instrument cluster will flash at twice the normal rate and the audible ticking from the instrument cluster sounder will also be at twice the normal rate.

AUXILIARY LIGHTING SWITCH

- NOTE: RHD (right-hand drive) switch shown

E98399

ItemDescription

1	Headlamp leveling rotary thumbwheel (halogen headlamps only)
2	Instrument panel illumination dimmer thumbwheel
3	Luggage compartment lid release switch

4 Forward alert switch (if fitted)

5 Rear fog lamp switch

The auxiliary lighting switch is located in the instrument panel, adjacent to the steering column. The switch has a rear fog lamp switch and a rotary thumbwheel to adjust headlamp leveling on vehicles with halogen headlamps. The auxiliary lighting switch also has a forward alert switch (if fitted) and a rotary thumbwheel for instrument panel illumination dimming.

The rear fog lamp switch is a non-latching switch which provides a momentary signal to the instrument cluster. The fog lamps can only be activated if the ignition is in power mode 6 and the headlamp or auto headlamps are selected on. If the fog lamp switch is pressed when the fog lamps are operating, they will be switched off. If the lighting control switch is moved to the side lamp or off position or if the auto headlamps turns off the headlamps the rear fog lamps will be extinguished. If the headlamps are subsequently turned on the rear fog lamp operation will not be active and the rear fog lamp switch must be pressed to activate the lamps.

HEADLAMP ASSEMBLY

Two types of headlamp are available; xenon or halogen. The headlamp is secured in the front of the vehicle with three bolts; one outboard bolt is screwed into the front upper cross member, one inboard bolt in the front upper body gusset and one bolt located at the rear of the headlamp assembly which locates in the front fender reinforcing panel. Bulb replacement requires the removal of the 3 bolts and the headlamp assembly.

The rear of the headlamp has removable panels which allow access to the bulbs for replacement. A large cover can be rotated counter-clockwise for removal allows access the headlamp low beam halogen or xenon D1S bulb. Another large removable cover can be rotated for removal to provide access to the high beam bulb, side lamp bulb and cornering/static bending lamp bulb (if fitted).

The headlamps have 2 adjustment screws on the rear which allow for the manual setting of the vertical and horizontal alignment.

On NAS vehicles, the headlamp is regarded as 'Visual Optically Left' aiming. The adjustment screws must be turned equal amounts to maintain the correlation in the vertical axis only. There is no horizontal adjustment. Refer to the Service Repair Procedures manual for headlamp alignment data and procedures.

Each headlamp has an integral 16 pin connector which provides inputs and outputs for the various functions of the headlamp assembly.

E98400

ItemDescription

1	Xenon control module (not fitted on halogen low beam headlamps)
2	Turn signal indicator
3	Side marker lamp (NAS only)
4	Projector module - Low beam headlamp(Halogen) – Low/High beam headlamp (xenon)
5	Cornering/static bending lamp (if fitted)
6	Side lamp
7	High beam headlamp
8	Power wash jets trim cover
9	Headlamp powerwash
10	Side marker lamp bulb (NAS only)
11	Turn signal indicator bulb
12	Headlamp adjuster screw (2 off)
13	Cover - Low beam headlamp projector module bulb
14	Mounting collar
15	Xenon igniter unit and bulb
16	Xenon igniter electrical connector
17	Cornering/static bending lamp bulb (if fitted)
18	Side lamp bulb

19	High beam headlamp bulb
20	Cover - Side lamp, cornering/static bending lamp (if fitted) and high beam headlamp bulbs
21	Electrical connector

Bi-Xenon Headlamp

The bi-xenon headlamp uses a projector lens, similar to the halogen headlamp. The projector module comprises an ellipsoidal lens and a reflector. The projector reflector collects the light produced by the halogen bulb and projects the light into a focal plane containing a shield. The contour of the shield is projected onto the road by the lens. A complex surface reflector is used for the halogen fill in high beam lamp. This type of reflector is divided into separate parabolic segments, with each segment having a different focal length. The low and high beam bulbs are quartz halogen H7, with a rating of 55W. The bulbs are retained in the headlamp unit with conventional wire retaining clips.

A tourist lever mechanism is located on the right hand side of the projector module. This mechanism moves a flap to blank off a portion of the beam spread to enable the vehicle to be driven in opposite drive hand markets without applying blanking decals to the headlamp lens. The beam is changed by removing the access cover at the rear of the lamp assembly and moving a small lever located near the bulb holder, at the side of the projector.

- **NOTE:** The tourist lever is not fitted to NAS vehicles.

WARNING: The Xenon system generates up to 30000 volts and contact with this voltage could lead to fatality. Make sure that the headlamps are switched off before working on the system.

The following safety precautions must be adhered to when working on the xenon low beam headlamp system:

- **DO NOT** attempt any procedures on the xenon headlamps when the lights are switched on.
- Handling of the D1S xenon bulb must be performed using suitable protective equipment; for example gloves and goggles. The glass part of the bulb must not be touched.
- Xenon bulbs must be disposed of as hazardous waste.
- Only operate the bulb in a mounted condition in the projector module installed in the headlamp.

The xenon headlamp is known as 'bi-xenon' because it operates as both a low and high beam headlamp unit. The xenon lamp, or High Intensity Discharge (HID) lamp as they are sometimes referred to, comprises an ellipsoidal lens with a solenoid controlled shutter to change the beam output from low to high beam.

- **NOTE:** If the lighting control switch is in the 'off' position, both the xenon lamp and the halogen high beam lamp will operate when the high beam 'flash' function is operated.

The xenon headlamp system is controlled by the [CJB](#) using a control module for each headlamp and an igniter. The control modules and the igniters provide the regulated power supply required to illuminate the bulbs through their start-up phases of operation.

The xenon headlamp is a self contained unit located within the headlamp assembly. The unit comprises a reflector, an adaptor ring, the lens, a shutter controller and the xenon bulb, which together forms an assembly known as the projector module. The reflector is curved and provides the mounting point for the xenon bulb. The bulb locates in a keyway to ensure the correct alignment in the reflector and is secured by a plastic mounting ring. The bulb is an integral component of the igniter and is electrically connected by a connector located in the igniter unit.

The shutter controller is a solenoid which operates the shutter mechanism via a lever. The shutter is used to change the beam projection from low beam to high beam and vice versa.

The xenon bulbs illuminate when an arc of electrical current is established between 2 electrodes within the bulb. The xenon gas sealed in the bulb reacts to the electrical excitation and the heat generated by the current flow to produce the characteristic blue/white light.

To operate at full efficiency, the xenon bulb goes through 3 full stages of operation before full output for continuous operation is achieved. The 3 phases are: start-up phase, warm-up phase and continuous phase.

In the start-up phase, the bulb requires an initial high voltage starting pulse of up to 30000 volts to establish the arc. This is produced by the igniter. The warm-up phase begins once the arc is established. The xenon control module regulates the supply to the bulb to 2.6A which gives a lamp output of 75W. During this phase, the xenon gas begins to illuminate brightly and the environment within the bulb stabilizes, ensuring a continual current flow between the electrodes. When the warm-up phase is complete, the xenon control module changes to continuous phase. The supply voltage to the bulb is reduced and the operating power required for continual operation is reduced to 35W. The process from start-up to continuous phase is completed in a very short time.

The xenon control modules (one per headlamp) receive an operating voltage from the [CJB](#) when the headlamps are switched on. The modules regulate the power supply required through the phases of start-up.

The igniters (one per headlamp) generate the initial high voltage required to establish the arc. The igniters have integral coils which generate high voltage pulses required for start-up. Once the xenon bulbs are operating, the igniters provide a closed circuit for the regulated power supply from the control modules.

Halogen Low/high Beam Headlamp

The halogen low/high beam headlamp uses a projector lens, similar to the xenon headlamp. The projector module comprises an ellipsoidal lens and a reflector. The projector reflector collects the light produced by the halogen bulb and projects the light into a focal plane containing a shield. The contour of the shield is projected onto the road by the lens. The low/high beam bulbs are quartz halogen and are retained in the headlamp unit with conventional wire retaining clips.

A tourist lever mechanism is located on the right hand side of the projector module. This mechanism moves a flap to blank off a portion of the beam spread to enable the vehicle to be driven in opposite drive hand markets without applying blanking decals to the headlamp lens. The beam is changed by removing the access cover at the rear of the lamp assembly and moving a small lever located near the bulb holder, at the side of the projector.

Halogen High Beam Headlamp - Xenon and Halogen

The xenon and halogen headlamps use a complex surface reflector for the halogen fill in high beam lamp only lighting unit, which is of the same design on both headlamp types. This type of reflector has the reflector divided into separate parabolic segments, with each segment having a different focal length.

The high beam headlamp bulbs are quartz halogen and are retained in the headlamp unit with conventional wire retaining clips.

Cornering Lamps

- NOTE: The cornering lamps are not fitted to NAS vehicles.

The cornering lamps are an optional feature designed to illuminate the direction of travel when cornering at low speeds. The design of the lens projects a spread of light from the vehicle at approximately 45 degrees to the vehicle axis. The cornering lamp is incorporated into the headlamp assembly and shares the same housing as the low beam headlamp. The cornering lamp uses a 35W Halogen H8 bulb which is permanently located in an integral holder which is connected on the headlamp housing. The holder is located in an aperture in the headlamp housing and rotated to lock. The bulb is accessible via a removable cover on the base of the headlamp housing.

The cornering lamps are controlled by the [LH](#) steering column multifunction switch with the lighting control switch in the headlamp position and the ignition in power mode 6. The cornering lamps are supplied power via the ignition circuit to ensure that they do not function with the headlamp delay feature. The cornering lamps are deactivated if the vehicle speed exceeds 25 mph (40 km/h). Only one cornering lamp will illuminate at any one time. If the left hand turn signal indicators are selected on, the left hand cornering lamp will be illuminated and vice versa, providing the vehicle speed and lighting control switch positions are correct.

Static Bending Lamps

- NOTE: The static bending lamps are not fitted to NAS vehicles.

The static bending lamps are designed to illuminate the direction of travel when cornering at low speeds. The static bending lamp functionality, which is controlled by the [CJB](#) and the headlamp leveling module, operates using inputs from the steering angle sensor and vehicle speed information from the [ABS \(anti-lock brake system\)](#) module. The static bending lamp is incorporated into the headlamp assembly and shares the same housing as the low beam headlamp. The design of the lens projects a spread of light from the vehicle at approximately 45 degrees to the vehicle axis. The static bending lamp uses a 35W Halogen H8 bulb which locates in a holder which is connected via wires to the main connector on the headlamp housing. The holder is located in an aperture in the headlamp housing and rotated to lock. The bulb is accessible via a removable cover at the rear of the headlamp housing.

The static bending lamps operate with a steering angle sensor [CAN](#) bus signal which is received by the [CJB](#). The [CJB](#) monitors this signal and vehicle speed and activates the static bending lamp bulb. When the operation parameters of the lamp are reached, the [CJB](#) fades the static bending lamp bulb on using a [PWM \(pulse width modulation\)](#) voltage over a period of approximately 2 seconds. When the lamp is switched off, the [CJB](#) fades the bulb off by decreasing the [PWM](#) voltage in a linear manner depending on steering angle and vehicle speed. The cornering lamps can only be active for a maximum of 3 minutes.

- NOTE: Static bending lamps only operate when the transmission is in DRIVE or in SPORT.

Turn Signal Indicators

The turn signal indicator lamp is incorporated into the outer part of the headlamp assembly. The turn signal indicator lamp uses a PY21W bayonet orange colored bulb in ROW markets, a S8W 27/7W wedge bulb is used in NAS markets. The bulb is fitted into a holder which connects with contacts in the headlamp housing. The holder is fitted into an aperture in the headlamp housing and rotated to lock into position.

When active, the turn signal indicator lamps will flash at a frequency cycle of 380ms on and 380ms off. If a bulb fails, the remaining turn signal lamps bulbs continue to flash at normal speed. The turn signal indicators in the instrument cluster will flash at double speed to indicate the bulb failure to the driver.

Side Lamps

The side lamp is located between the headlamp projector module and the high beam headlamp. The side lamp uses a W5W wedge fitting bulb which locates in a holder which connected via wires to the main connector on the headlamp housing. The holder is a push fit into a receptacle in the headlamp housing. The bulb is accessible by removal of the inner cover on the rear of the headlamp housing. Access to the bulb requires removal of the headlamp from the vehicle. The side lamps are operated by selecting side lamps or headlamps on the lighting control switch. The side lamps are functional at all times and are dependant on a particular ignition mode status. The side lamps will also be illuminated when the lighting control switch is in the AUTO position and a 'lights on' signal is received by the [CJB](#) from the rain/light sensor

Side Marker Lamps (NAS only)

The side marker lamp is located in the outer part of the headlamp assembly. The side marker lamp uses a W5W wedge fitting bulb. The bulb is fitted into a holder which connects with contacts in the headlamp housing. The holder is fitted into an aperture which connects with contacts in the headlamp housing. The side marker lamp is active at all times when the side lamps are active.

AUTOMATIC HEADLAMP OPERATION

The automatic headlamp function is a driver assistance system. The driver can override the system operation by selection of side lamp or headlamp on if the ambient light conditions require front and rear lighting to be active. The automatic headlamp system uses a light sensor and the [CJB](#), which are connected via a [LIN \(local interconnect network\)](#) bus to control the headlamp functionality. The light sensor is incorporated in the rain/light sensor located on the inside of the windshield, below the rear view mirror. The wiper system also uses the rain/light sensor for automatic wiper operation.

The light sensor measures the ambient light around the vehicle in a vertical direction and also the angular light level from the front of the vehicle. The rain/light sensor uses vehicle speed signals, wiper switch position and the park position of the front wipers to control the system. The automatic headlamp operation uses ambient light levels which are monitored by photodiode incorporated in the rain/light sensor. The rain/light sensor sends a lights on/off request to the [CJB](#) on the [LIN](#)

bus, which responds by switching on the low beam headlamps, front side lamps and rear tail lamps. The automatic headlamps are activated under the following conditions:

- Twilight
- Darkness
- Rain
- Snow
- Tunnels
- Underground or multistoried car parks.

Operation of the automatic headlamps requires the ignition to be in ignition mode 6, the lighting control switch to be in the 'AUTO' position and a lights on request signal from the light sensor. If the rain sensor signal activates the fast speed wipers, the low beam headlamps are activated, providing the lighting control switch is in the 'AUTO' position.

HEADLAMP LEVELING

Headlamp leveling provides for the adjustment of the vertical aim of the headlamps. The leveling system is primarily required to minimise glare to other road users when a heavy load is in the rear of the vehicle. Two systems of headlamp leveling are available; manual and static dynamic.

Manual Headlamp Leveling

The manual system uses a thumbwheel rheostat to adjust the vertical alignment of the headlamps to compensate for differing vehicle loading. The rotary thumbwheel is located on the auxiliary lighting switch, adjacent to the illumination dimmer thumbwheel. Three positions are available to adjust the headlamps to a position to prevent glare to other road users.

Static Dynamic Headlamp Leveling

The static dynamic headlamp leveling system uses the following components:

- Front and rear vehicle height sensors
- Two headlamp leveling, vertical adjustment motors
- Headlamp leveling module
- Ignition in mode 6
- Vehicle speed information from [ABS](#) module.

The static dynamic system uses height sensors fitted to the front and rear suspension and a headlamp leveling module which periodically monitors the vehicle attitude and adjusts the headlamp vertical alignment accordingly.

Static dynamic headlamp leveling is controlled by a headlamp leveling module located in the lower instrument panel, behind the glovebox.

The height sensors are both located on the [RH](#) side of the vehicle. The front sensor is attached to the front suspension lower arm with a strap and to the front sub frame with a bracket and 2 bolts. The rear sensor is attached to the rear suspension upper control arm with a cable tied clip and to the rear sub frame with a bracket and 2 bolts. Each sensor has 3 connections to the headlamp leveling module; power, ground and signal.

DAYTIME RUNNING LAMPS (DRL)

Refer to [DRL](#) section for details.

Refer to: [Daytime Running Lamps \(DRL\)](#) (417-04 Daytime Running Lamps (DRL), Description and Operation).

REAR LAMP ASSEMBLY

The rear lamp assembly is a 2 piece unit, with one part located in the rear quarter panel and the second part attached to the luggage compartment lid. The outer rear lamp assembly is located in a recess in the vehicle body. The lamp is secured with 2 studs inboard studs on the lamp body which are secured to the vehicle body with 2 nuts. A third outboard stud and nut secures a clip to the vehicle body. To remove the lamp assembly, only the 2 inboard nuts require removal. The outboard nut retains a sliding clip in position on the vehicle body. To remove the rear lamp assembly, remove the 2 inboard nuts and slide the lamp rearwards to release the outboard clip.

The inner rear lamp is located in a recess in the luggage compartment lip and secured with a clip.

E98401

ItemDescription

1	Nut (3 off)
2	Reverse lamp bulb and holder
3	Rear lamp electrical connector
4	Turn signal indicator bulb and holder
5	Securing clip
6	Rear fog lamp electrical connector
7	Rear fog lamp LED's and Printed Circuit Board (PCB)
8	Side marker LED's (4 off - all markets)
9	Reverse lamp
10	Turn signal indicator lamp
11	Side lamp/stop lamp LED's (24 off)
12	Rear fog lamp LED's (3 off)

Rear Stop and Side Lamp

The turn signal indicator, side and stop lamps and reverse lamps are located in each outer rear lamp assembly. The side lamps and stop lamps use 24 LED's. The 24 LED's are illuminated at a higher intensity than the side lamp when the stop lamp switch is operated by pressing the brake pedal. A side marker lamp is fitted to the outer rear lamp assembly and is fitted in all markets. The side marker lamp also uses 4 LED's and are active at all times when the side lamps are selected on.

The stop lamps can also be activated by the adaptive speed control system. A signal from the adaptive speed control module is sent via the high speed CAN bus to the RJB which activates the stop lamps until an off message is received.

Turn Signal Indicator

The turn signal indicator lamp uses a Phillips Hypervision glass filament bulb. The bulb is located in a holder which has contacts which mate with contacts on lamp body. The holder locates in the lamp body and is rotated to lock.

If a bulb fails, the remaining turn signal indicator lamps continue to flash at the normal speed. The applicable turn signal indicator in the instrument cluster will flash at double speed to indicate the bulb failure to the driver.

Reverse Lamp

The reverse lamp also uses a Phillips Hypervision glass filament bulb. The bulb is located in a holder which has contacts which mate with contacts on lamp body. The holder locates in the lamp body and is rotated to lock.

The reverse lamps are activated on receipt of a reverse selected message sent on the medium speed CAN bus to the RJB.

Rear Fog Lamp

The rear fog lamps are located in separate units attached to the luggage compartment lid. The rear fog lamps each use 3

high intensity [LED](#)'s. The fog lamp located in a recess in the luggage compartment lid has a seal to prevent the ingress of water into the luggage compartment. The lamp is secured in the recess with a metal securing clip. The rear fog lamp is activated using a button located on the auxiliary lighting switch in the instrument panel.

LICENCE PLATE LAMPS

Two licence plate lamps are located in the luggage compartment lid trim finisher. One is located adjacent to the emergency luggage compartment lid release key barrel cover and the other is adjacent to the rear view camera (if fitted). The licence plate lamps are active at all times when the side lamps are operating. Each lamp can be removed from the finisher by inserting a wide, flat screwdriver blade or similar tool in a slot between the lamp lens and the finisher and gently levering the lamp from the surround. The bulb is a push fit in a holder which in turn is a press fit in the lamp housing.

HIGH MOUNTED STOP LAMP

The high mounted stop lamp is located at the bottom of the rear windshield. The lamp is secured to a bezel in the parcel shelf with 2 screws.

The high mounted stop lamp uses 12, red colored [LED](#)'s which illuminate through a clear lens. The high mounted stop lamp functionality is the same as that described for the stop lamps.

TURN SIGNAL INDICATOR SIDE REPEATER LAMPS

The turn signal indicator side repeaters are located in each door mirror. On vehicles from 10MY the lamp is an [LED](#) unit which illuminates in an orange color. The [LED](#) unit is secured to the mirror bezel with 2 screws and is connected to the mirror wiring harness with a 2 pin connector.

The side repeaters have the same functionality and operate in conjunction with the front and rear turn signal indicators and the hazard warning flashers.

HAZARD FLASHERS

The hazard flashers are activated by a non-latching switch located in the switch pack located in the center of the instrument panel. The hazard flashers operate at all times when selected and operate independent of the ignition mode.

When the hazard flashers are selected on by the driver, a ground path is momentarily completed to the [CJB](#) which activates the front and rear and side repeater turn signal indicators. A second press of the switch is sensed by the [CJB](#) and the hazard flasher are deactivated. When the hazard flashers are active, they override any request for turn signal indicator operation.

The hazard flashers can also be activated by a crash signal from the [RCM](#).

Refer to: [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) (501-20B Supplemental Restraint System, Description and Operation).

Exterior Lighting - Headlamps

Diagnosis and Testing

Principles of Operation

Safety Information

• WARNINGS:

The Xenon Headlamp system generates up to 28,000 volts. Make sure that the headlamps are switched off before working on the system. Failure to follow this instruction may lead to fatality.

The following safety precautions must be followed when working on the Xenon Headlamp System:

- DO NOT attempt any procedures on the Xenon Headlamps or circuits when the system is energized.
- Handling of the xenon bulb must be performed using suitable protective equipment, e.g. gloves and goggles. The glass part of the bulb must not be touched.
- Only operate the lamp in a mounted condition in the reflector.
- All safety procedures and precautions must be followed to prevent personal injury.

CAUTION: Xenon bulbs must be disposed of as hazardous waste.

There are instructions on the correct procedures for Xenon Headlamp System repairs in the manual, refer to section 100-00 - General Information, Standard Workshop Practices of the workshop manual.

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage.

Visual Inspection

Electrical
<ul style="list-style-type: none"> ● Headlamp Leveling Module (HLM) ● Bulb(s) ● Photocell(s) ● Ballast ● Wiring harness/electrical connectors ● Fuse(s)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to DTC Index.

Symptom Chart

Symptom	Possible Causes	Action
Low beam lamp(s) inoperative	<ul style="list-style-type: none"> ● Bulb failure ● Fuse(s) blown ● Circuit fault ● Lighting control switch fault 	Check the bulb and fuse condition (see visual inspection). Check the headlamp circuits. Check the lighting control switch function. Check the left-hand steering column multifunction switch operation. Refer to the electrical guides. Check for DTCs indicating a headlamp or related circuit fault.
High beam lamp(s) inoperative	<ul style="list-style-type: none"> ● Left-hand steering column multifunction switch fault 	
Low beam lamp(s) dim	<ul style="list-style-type: none"> ● Incorrect bulb rating ● Tourist lever set in the wrong position ● Circuit fault 	Check the bulb condition and rating. Check the tourist lever is set correctly. Check the headlamp circuits. Check the lighting control switch function. Check the left-hand steering column multifunction switch function. Refer to the electrical guides.

Symptom	Possible Causes	Action
High beam lamp(s) dim	<ul style="list-style-type: none"> ● Lighting control switch fault ● Left-hand steering column multifunction switch fault 	
Low beam lamp(s) stuck on	<ul style="list-style-type: none"> ● Circuit fault ● Lighting control switch fault ● Left-hand steering column multifunction switch fault 	Check the headlamp circuits. Check the lighting control switch function. Check the left-hand steering column multifunction switch operation. Check the headlamp timer function. Refer to the electrical guides. Check for DTCs indicating a headlamp circuit fault
High beam lamp(s) stuck on	<ul style="list-style-type: none"> ● Headlamp timer function fault 	
Headlamp low/high beam switching function inoperative	<ul style="list-style-type: none"> ● Circuit fault ● Left-hand steering column multifunction switch fault ● Xenon lamp shutter mechanism fault 	Check the headlamp circuits. Check the left-hand steering column multifunction switch operation. Check the xenon lamp shutter mechanism operation. Refer to the electrical guides. Check for DTCs indicating a headlamp circuit fault
Warning lamp(s) inoperative	<ul style="list-style-type: none"> ● Fuse(s) blown ● Lighting control switch fault ● Left-hand steering column multifunction switch inoperative ● Circuit fault ● Instrument cluster fault 	Check the fuse(s) (see visual inspection). Check the lighting control switch function. Check the left-hand steering column multifunction switch function. Check the warning lamp circuits. Refer to the electrical guides. Check for DTCs indicating an instrument cluster or CAN system fault.
Headlamp Wet - Internal	<ul style="list-style-type: none"> ● Condensation ● Water Ingress 	Check for outstanding Technical Service Bulletins (TSBs) relating to 'Headlamp Internal Condensation'. Carry out the instructions in the service bulletin to determine if the fault is related to condensation or water ingress.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

• NOTE: Prior to installation/replacement of the Headlamp Assembly carry out all relevant internal visual and mechanical checks for correct cable location and termination including: checks for corroded, bent or backed out pins or terminals, incorrectly inserted connectors and harness damage due to chaffing or incorrect routing.

• NOTE: If the control module has been removed and reinstalled, carry out a DTC code clear, cycle the ignition state to off, then on. This will erase any DTCs that have been logged during the module installation procedure

Headlamp Leveling Module (HLM)

DTC	Description	Possible Cause	Action
B1041-04	Leveling Control - System Internal Failures	<ul style="list-style-type: none"> ● Module internal failure 	Suspect Headlamp Leveling Module internal fault. Replace as required, refer to the new module/component installation note at the top of the DTC Index
B1041-54	Leveling Control - Missing calibration	<ul style="list-style-type: none"> ● Leveling sensor calibration routine not carried out 	<p>• NOTE: This DTC will normally be logged when a new module has been installed.</p> <p>• NOTE: Sensor calibration routine must be carried out with the vehicle unladen.</p> <p>Calibrate the Headlamp Leveling sensors using the manufacturer approved diagnostic system, carry the out routine 'Headlamp Control Module System Calibration' from the 'Module programming and configuration - Setup and Configuration - Lighting'</p>

Exterior Lighting - Headlamp Leveling Front Sensor

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the headlamp leveling sensor.
 - Disconnect the height sensor link.
 - Disconnect the electrical connector.
 - Remove the 2 bolts.

3. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the height sensor link.

4. **NOTE:** Note the fitted position.

Remove the bracket.

- Remove the 2 Allen bolts.

Installation

1. **NOTE:** Align to the position noted on removal.

Install the bracket.

- Tighten to 5 Nm.

2. Install the height sensor link.

3. Install the headlamp leveling sensor.

- Tighten to 25 Nm.
- Connect the electrical connector.
- Connect the height sensor link.

Exterior Lighting - Headlamp Leveling Rear Sensor

Removal and Installation

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the headlamp leveling sensor.
 - Disconnect the height sensor link.
 - Release and disconnect the electrical connector.
 - Remove the 2 bolts.

9	Approach lamp
10	Door casing LED illumination
11	Footwell lamps

Interior Lighting - Interior Lighting - Overview

Description and Operation

OVERVIEW

Interior lighting is provided to enable the safe entry and departure from the vehicle for the driver and passengers in low ambient light conditions, without any manual switching of the lights.

- **NOTE:** The term interior lamps also includes the door mirror approach lamps.

The interior lamps are controlled by the [CJB \(central junction box\)](#) and the [RJB \(rear junction box\)](#) and have 2 modes of operation: manual and automatic. The front interior lamps in the front overhead console are operated using the 'JaguarSense' system. The system uses capacitive proximity sensor technology for the switch operation which is integral with the overhead console. The rear overhead console interior lamps have conventional switches.

In the manual mode the interior lamps can be switched on and off with the JaguarSense system. Positioning your hand adjacent to each lamp in the front overhead console will switch interior lamps on or off and completely disable the interior lamp system. In the automatic mode the interior lamp functionality is controlled by the [CJB](#) and the [RJB](#) and reacts to the vehicle being locked or unlocked and opening the vehicle doors.

In manual mode the interior lamps can be operated by placing your finger(s) close to, or touch, the surface of the appropriate lamp. The courtesy light and map reading lamps can be operated manually by the 'JaguarSense' system. When in automatic mode, the courtesy lamp functionality is also controlled by the [CJB](#) and the [RJB](#) and reacts to the vehicle being locked or unlocked and opening the vehicle doors. To deactivate or activate automatic illumination, touch the front courtesy lamp for approximately 2 seconds

The driver's and passenger door approach lamps are controlled by the driver's door module and the passenger door module respectively and operate with the automatic mode. The door modules receive a power supply from the [RJB](#) and receive information to illuminate the approach lamps on the medium speed [CAN \(controller area network\)](#) bus from the [RJB](#) and the [CJB](#).

System Operation

JUNCTION BOXES

Inputs

The [CJB](#) receives the following inputs which affect the operation of the interior lamps:

- Ignition mode
- Lock/unlock
- Luggage compartment lid latch switch
- Door latch switches.

Outputs

The [RJB](#) outputs the following for the interior lighting system:

- Luggage compartment lamp power supply
- Driver and passenger door module power supplies
- Fade on and off grounds for front and rear overhead console interior lamps and footwell lamps
- [PWM \(pulse width modulation\)](#) power output for the ambience lighting.

Interior Lamp Time-Out

The interior lamps are controlled by a timer within the [CJB](#) which allows a 60 second delay period for the lamps to remain active after the ignition mode has been changed to off power mode 0 or the vehicle has been unlocked. The interior lamp fade off is controlled by the [RJB](#) via a delayed power off relay in the [CJB](#). The following interior lamps are subject to the delay period:

- Front overhead console interior lamp
- Rear interior lamps
- Footwell lamps
- Door mirror approach lamps.

The timer delay is activated when the [CJB](#) receives one of the following signals:

- An unlock signal from the Smart Key via the keyless vehicle module.
- Ignition mode is changed from the crank power mode 9 or ignition power mode 6 to the accessory power mode 4 to the off power mode 0.

If a second occurrence of the above actions occurs within the timer period, the timer will be reset and the delay period timer will restart.

The timer delay is deactivated when the [CJB](#) receives one of the following signals:

- A lock signal from the Smart Key via the keyless vehicle module
- Ignition mode is changed from the off power mode 0 to the accessory power mode 4 or ignition power mode 6
- The [CJB](#) receives a door opened signal (even if that door is subsequently closed).

Battery Saver

The battery saver provides an automatic shut-off of the interior lamps after a period of 15 minutes in order to prevent excessive power drain on the battery.

When the ignition mode is changed from the ignition power mode 6 or accessory power mode 4 to the off power mode 0, the [CJB](#) starts a timer which de-energizes a delayed power off relay in the [CJB](#), removing the power supply to the interior lamps after a period of 15 minutes, switching off all or any interior lamps which have remained on for any reason.

Once the timer has expired and the lamps are off, any one of the following will 'wake up' the battery saver and the interior lamps will function again. The timer will be restarted as soon as an input is received by the [CJB](#) from one of the following:

- Ignition mode changed from off power mode 0 to accessory power mode 4, ignition power mode 6 or crank power mode 9.
- Any door, including the luggage compartment lid is opened
- An unlock request is received from the Smart Key via the keyless vehicle module
- Overhead console interior lamp is switched on via the JaguarSense function.

INTERIOR LAMPS

When the interior lighting system switches the interior lamps on, the [CJB](#) ramps the lamps up to full power over a period of 1.3 seconds. When the system switches the lamps off, after the time-out period has expired, the [CJB](#) fades the lamps off over a period of 2.6 seconds.

The interior lighting system will illuminate the interior lamps when one of the following events occurs:

- The [CJB](#) receives an unlock signal from the Smart Key via the keyless vehicle module

- Any door is opened including the luggage compartment lid
- The ignition mode is changed from ignition power mode 6 or accessory power mode 4 to off power mode 0.

The interior lighting system will turn off the interior lamps when one of the following events occurs:

- Once the time-out timer delay has expired since the lamps were either activated or the last door is closed and the vehicle is not locked
- The ignition is in off power mode 0 and an external lock is requested (using either the door lock buttons or the Smart Key) with all doors closed
- The ignition mode is changed from the off power mode 0 or the accessory power mode 4 to the ignition power mode 6
- The last door is closed and the vehicle is externally locked, on receipt of an unlock request from the Smart Key or door handle operation detected when the time-out timer is still active.

DELIVERY MODE

Delivery mode is set at the factory on vehicles to minimize battery drain. The mode enables the switching off of non-critical electrical components, including the interior lighting system. The delivery mode feature is cancelled by the dealer during the Pre-Delivery Inspection using an approved Jaguar diagnostic system.

CRASH ILLUMINATION

When a crash signal is received from the [RCM \(restraints control module\)](#), the [CJB](#) activates the interior lamps once the vehicle speed has reduced to 5 km/h (3.1 mph). The hazard flashers are also activated and the doors are prevented from being locked. The lamps remain on until the crash signal is removed, they cannot be switched off using the JaguarSense feature. The crash signal is removed by completing one ignition on and off cycle.

Component Description

INTERIOR BULB TYPE/RATING

The following table shows the bulbs used for the interior lighting system and their type and specification.

• **NOTE:** The front overhead console and the front door ambience lighting is illuminated by [LED's](#) and are non-serviceable components.

Bulb	Type	Rating
Front overhead console - interior lamp	W6WX	6W
Front overhead console - LH/RH map reading lamps	W6WX	6W
Rear interior lamps	W6WX	10W
Sunvisor lamps	TS1.3W	1.3W
LH/RH footwell lamps	W5W	5W
Glovebox lamp	W5W	5W
LH/RH door mirror approach lamps	W5W	5W
Luggage compartment lamp	S10W	10W

JUNCTION BOXES

The [CJB](#) is an integrated unit located on the [RH](#) 'A' pillar, below the instrument panel. The [CJB](#) contains fuses, relays and number of microprocessors which control the power supply and functionality of the interior lighting system and other vehicle systems.

The [RJB](#) is located on the [RH](#) side of the luggage compartment. The [RJB](#) contains fuses, relays and microprocessors which in conjunction with the [CJB](#) control the interior lighting system and other vehicle systems.

Circuit Protection

The [CJB](#) and the [RJB](#) provide circuit protection for all interior lamp circuits. The lamps are protected by fuses in the [CJB](#) and the [RJB](#).

FRONT OVERHEAD CONSOLE

E98639

ItemDescription

1	LH map reading lamp bulb
2	Interior lamp bulb
3	RH map reading lamp bulb
4	Printed Circuit Board (PCB) - JaguarSense
5	Ambience lighting LED's
6	RH map reading lamp
7	Interior lamp
8	LH map reading lamp

The overhead console is located near the windshield in the head lining. The console can be removed by carefully levering out the rear edge of the housing to release 2 spring clips, and then pulling the console rearwards to release 2 locating tabs. Removal of the console is required to replace any of the interior or map reading lamp bulbs.

The interior lamps and air bag off warning lamp in the front overhead console are common to all vehicles. The overhead console can also contain security system intrusion detection module and volumetric sensors, sunroof switch and a voice activation microphone depending on vehicle specification and market.

The interior lamp can operated manually using the JaguarSense feature to switch the lamp on and off. The lamp is also controlled as part of the automatic interior lighting system.

The map reading lamps only operate manually using the JaguarSense feature to activate the lamps.

The interior and map reading lamp bulbs are located in holders which locate in a PCB. The PCB also provides for the operation of the ambience lighting [LED's](#), the air bag off warning lamp and the JaguarSense proximity sensors which are integral with the PCB.

The overhead console also contains 2 [LED's](#) for the ambience lighting system. The ambience lighting is part of the lighting control switch functionality and is subject to the setting of the instrument panel illumination dimmer control in the auxiliary lighting switch. The ambience lighting provides very limited illumination of the instrument panel and floor console when the vehicle is being driven without affecting the driver's visibility.

REAR OVERHEAD CONSOLE

E98640

ItemDescription

1	Lamp body
2	Lamp lens
3	Interior lamp bulbs
4	LH lamp switch
5	RH lamp switch
6	Bulb holders

The rear overhead console is located in the head lining, at the rear of the vehicle. The console can be removed by carefully levering the lamp lens from the body. This releases 2 tabs which are integral with the lens allowing the body to be removed from the aperture in the head lining.

the lamp comprises the lamp body and lens and 2 separate lamps with 2 switches to operate each lamp individually.

The rear interior lamps can be operated manually using the 2 switches located on the lamp body. The lamp is also controlled as part of the automatic interior lighting system.

The bulbs are located in bulb holders which are located on a PCB connected to each switch. Removal of the rear overhead console is required to replace the bulbs.

GLOVEBOX LAMP

The glovebox lamp is located in the top of the glovebox housing in the instrument panel. The lamp is located in a cover on the outside, upper surface of the housing and projects the light into the top of the glovebox.

The lamp is operated by a switch located at the rear of the glovebox housing. The switch protrudes into the housing and is operated by the rear face of the glovebox lid tray when the glovebox is opened or closed.

The bulb is located in a holder which is fitted into the side of the glovebox lamp cover. Replacement of the bulb requires the removal of the glovebox housing.

The glovebox lamp is active at all times when the interior lamps are active and will illuminate only when the glovebox is opened.

FOOTWELL LAMPS

The footwell lamps are located under the instrument panel. Each lamp comprises a bulb and holder which is part of the instrument panel wiring harness. The bulb and holder is located in a hole in the front footwell air ducts. The footwell lamps are active at all times when the interior lamps are active.

LUGGAGE COMPARTMENT LAMP

The luggage compartment lamp is located in the luggage compartment trim, in a central position below the rear screen. The lamp comprises a molded lens and housing and two electrical contacts which locate the bulb.

The lamp is accessible by removing one end from the trim panel to gain access to the bulb. The lamp is active at all times when the interior lamps are active.

VANITY MIRROR LAMPS

Four vanity mirror lamps are fitted, two in each vanity mirror. The lamps are illuminated when the mirror cover is raised. The vanity mirror lamps operate at all times when the interior lamps are active.

The vanity mirrors use low voltage, 1.2W festoon type bulbs.

DOOR MIRROR APPROACH LAMPS

A door mirror approach lamp is located on the underside of each exterior door mirror.

The approach lamps are active at all times when the interior lamps are active.

Interior Lighting - Interior Lighting

Diagnosis and Testing

Principles of Operation

For a detailed description of the interior lighting system, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (417-02 Interior Lighting)

[Interior Lighting](#) (Description and Operation),
[Interior Lighting](#) (Description and Operation),
[Interior Lighting](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Bulbs 	<ul style="list-style-type: none"> ● Fuses/relays (refer to electrical guide) ● Wiring harness ● Correct engagement of electrical connectors ● Loose or corroded connections

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Daytime Running Lamps (DRL) - Daytime Running Lamps (DRL) - Overview

Description and Operation

OVERVIEW

[DRL \(daytime running lamps\)](#) use the full intensity low beam headlamps which are permanently illuminated when the vehicle is being driven.

Two [DRL](#) systems are available depending on market requirements.

Daytime Running Lamps (DRL) - Daytime Running Lamps (DRL) - System Operation and Component Description

Description and Operation

System Operation

CENTRAL JUNCTION BOX (CJB)

The [CJB](#) (central junction box) controls the operation of the [DRL](#) (daytime running lamps). The [DRL](#) are activated once the [CJB](#) detects an ignition on power mode 6 signal.

The [CJB](#) also monitors the lighting control switch and the auto lamps feature and overrides the [DRL](#) if required.

Component Description

DAYTIME RUNNING LAMPS - CANADA

The [DRL](#) for this market use full intensity low beam headlamps. The side marker lamps, tail lamps and license plate lamps will be on, but instrument cluster illumination will be off. [DRL](#) are active when the following parameters are met:

- PARK is not selected on the electronic transmission selector
- Electronic Parking Brake (EPB) is off
- Power mode 6 (ignition on) detected by the [CJB](#)
- The [CJB](#) receives an engine running signal
- The lighting control switch is in the off or side lamps position.

• NOTE: If the lighting control switch is moved to the headlamp position, [DRL](#) are deactivated and normal side lamp and headlamp functionality is operational.

• NOTE: When [DRL](#) are active, the headlamp flash function using the left hand steering column multifunction switch will operate normally.

The high beam headlamp function using the left hand steering column stalk switch will be deactivated. When the transmission is in PARK, [DRL](#) are turned off. This is to reduce battery discharge during long periods of engine idling in cold climate conditions. When the electronic transmission selector is moved from the PARK position, normal [DRL](#) functionality is restored.

DAYTIME RUNNING LAMPS - DENMARK, HOLLAND, NORWAY, SWEDEN, FINLAND AND POLAND

• NOTE: DRL for Poland is on vehicles from 2008MY.

[DRL](#) for these markets use full intensity low beam headlamps. Side lamps and license plate lamps will be on, but instrument cluster illumination will be off. [DRL](#) are active when the following parameters are met:

- Power mode 6 (ignition on) detected by the [CJB](#)
- The [CJB](#) receives an engine running signal
- The lighting control switch is in the off position.

• NOTE: When [DRL](#) are active, the headlamp flash function using the left hand steering column multifunction switch will operate normally. The high beam headlamp function using the left hand steering column stalk switch will be deactivated.

If the lighting control switch is moved to the side lamp or headlamp positions, [DRL](#) are deactivated and normal side lamp and headlamp functionality is operational.

AUTOMATIC HEADLAMPS

On vehicles fitted with the automatic headlamps feature, [DRL](#) are overridden if the lighting control switch is in the 'Auto' position and the [CJB](#) receives a signal from the rain/light sensor to activate the exterior lights.

When the [CJB](#) receives a signal to de-activate the automatic headlamps feature the [DRL](#) function is restored providing the parameters for [DRL](#) activation are met.

Module Communications Network - Communications Network - Overview

Description and Operation

OVERVIEW

A number of different types of communication network are incorporated into the vehicle wiring harnesses for the transmission of commands and information between control modules. The configuration installed on a particular vehicle depends on the model and equipment level.

- NOTE: The control diagrams shown later in this section are schematics reflecting communications networks fitted to LH (left-hand) vehicles only. For detailed layouts of the various communications networks fitted to LHD (left-hand drive) and RHD (right-hand drive) vehicles, refer to the Electrical Guide.

The communications networks available on the vehicle are shown in the table below.

Network	Baud Rate
LIN (local interconnect network) bus	9.6 kbits/s
Medium speed CAN (controller area network) bus	125 kbits/s
High speed CAN bus	500 kbits/s
Media Orientated System Transport (MOST) ring	24 mbits/s

Module Communications Network - Communications Network

Diagnosis and Testing

Principles of Operation

For a detailed description of the Communications Network, refer to the relevant Description and Operation sections in the workshop manual. REFER to:

Communications Network (418-00, Description and Operation),
[Communications Network](#) (418-00 Module Communications Network, Description and Operation),
[Communications Network](#) (418-00 Module Communications Network, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Visual Inspection	Electrical
<ul style="list-style-type: none"> ● Fuses (refer to electrical guide) ● Wiring harness ● Correct engagement of electrical connectors ● Loose or corroded connections ● Routing of fibre optic harnesses ● Correct engagement of optical connectors ● Correct placement of optical connectors (ring order) ● Correct assembly of optical connectors (backout, etc) ● Damage to fibre (chafing, abrasion, kinking, cuts, etc) 	

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

CAN Network Integrity Checks

In the event that one or more control modules are not communicating on either the Medium Speed (MS) or High Speed (HS) CAN Buses, checks can be performed to confirm the integrity of the CAN harness.

The following information is applicable to HS and MS CAN Buses accessible via the J1962 diagnostic connector.

Module Connections to the CAN Harness

Modules are connected to the CAN harness either in a 'loop' or 'spur' configuration. In the 'loop' type configuration the CAN harness loops into the module (via two connector pins) and then loops out of the module (via another two connector pins). In the 'spur' type configuration, a harness spur is spliced into the main 'backbone' of the CAN harness and the module is connected to the harness spur via two connector pins.

CAN Harness Architecture

For a detailed description of the CAN Networks and architecture, refer to the relevant Description and Operation section in the Workshop Manual. REFER to:

Communications Network (418-00, Description and Operation),
[Communications Network](#) (418-00 Module Communications Network, Description and Operation),
[Communications Network](#) (418-00 Module Communications Network, Description and Operation).

IDS Vehicle Integrity Test

If a control module is suspected of non-communication, the Network Integrity test application available on the manufacturer approved diagnostic system can be used to confirm if communication is possible between the control modules on the vehicle and the manufacturer approved diagnostic system (via the J1962 diagnostic connector). The results from the test can be used to determine if either a single module or multiple modules are failing to communicate.

CAN Terminating Modules

If the Network Integrity test indicates that one or more module on one of the CAN networks (HS or MS) are failing to communicate, there are several checks that can be made. The first step is to identify if both of the CAN terminating modules on each individual CAN Bus are communicating. If both CAN terminating modules for each individual CAN Bus are communicating (identified via the Network Integrity test), then it can be confirmed that the main 'backbone' of the CAN harness is complete. The main 'backbone' of the CAN harness consists of all the modules connected to the CAN harness via a 'loop' configuration and also includes the two terminating modules.

Communication with both CAN terminating modules via the Network Integrity test confirms the physical integrity of the main 'backbone' of the CAN harness (and the harness spur to the J1962 diagnostic connector). This means that there is no requirement to check the resistance of the CAN Network. This is because the standard check for 60 ohms across the CAN

High and CAN Low lines will not provide any additional information regarding the physical condition of the CAN harness, beyond what has already been determined from the Network Integrity test.

Non-Communication of a Terminating Module

If a Network Integrity test reveals a terminating module is failing to communicate it can indicate a break in the main 'backbone' of the CAN harness. The first checks should always be to confirm the power and ground supplies to the non-communicating module are correct. Providing these are correct, the resistance between the CAN High and CAN Low lines at the J1962 connector can be checked to determine the integrity of the main 'backbone' of the CAN harness. After disconnecting the battery a reading of 120 ohms would indicate an open circuit in the main 'backbone' of the CAN harness. Alternatively, a reading of 60 ohms would indicate that there is no open circuit fault with the main 'backbone' of the CAN harness.

It is worth noting that even if one of the terminating modules is disconnected from the CAN harness, communications between the modules still connected may still be possible. Therefore communication between the manufacturer approved diagnostic system and the connected modules may also be possible.

Locating CAN Harness Open Circuits

In the case where multiple modules, including a terminating module, are failing to communicate, having first confirmed the power and ground supplies are correct, the approximate location of the open circuit can be identified from analysis of the Network Integrity test results and reference to the relevant CAN network circuit diagrams. For example, if an open circuit existed in a certain position on the CAN harness, any module positioned on the Network between the J1962 connector and the open circuit should return a response during the Network Integrity test. No responses would be returned from any modules past the open circuit fault in the Network.

CAN Harness 'Spur' Type Configuration Circuits

If, after the initial checks (Network Integrity test using the manufacturer approved diagnostic system, and power and ground supplies to the module have been checked and confirmed as correct), a module that is connected to the CAN harness via a 'spur' type configuration is suspected of not communicating, then the physical integrity of the CAN harness 'spur' can be checked.

This is most easily undertaken by individually checking the continuity of the CAN High and CAN Low lines between the non-communicating module connector (with the module disconnected) and the J1962 diagnostic connector.

'Lost Communications' DTCs

As well as the methods described so far in this document, which can be used to determine the location of an open circuit in the CAN harness, 'Lost Communications' DTCs can also be used for this purpose.

For example, if a global DTC read were to be carried out, only DTCs stored in the modules that the manufacturer approved diagnostic system could communicate with would be displayed. If there were an open circuit fault in a certain position on the CAN harness, the modules that could display DTCs would all be prior to the open circuit on the Network, and these modules should display 'Lost Communications' DTCs with all the modules located on the Network past the open circuit fault.

- NOTE: Additional DTCs may also be logged along with the 'Lost Communications' DTCs.

DTC Index

Central Junction Box (CJB)

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

- NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.
- NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).
- NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
- NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

U210000	Initial Configuration Not Complete	<ul style="list-style-type: none"> RJB configuration (parameters) failure 	Re-configure the RJB using the manufacturer approved diagnostic system
U300049	Control Module	<ul style="list-style-type: none"> Internal electronic failure 	Suspect the CJB. Check and install a new CJB as required, refer to the new module/component installation note at the top of the DTC Index
U300055	Control Module	<ul style="list-style-type: none"> Not configured 	Re-configure the RJB using the manufacturer approved diagnostic system. Check the correct CJB is installed to vehicle market/specification. Install a new/correct CJB as required, refer to the new module/component installation note at the top of the DTC Index
U300087	Control Module	<ul style="list-style-type: none"> Missing message 	Carry out CAN network integrity test using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check CAN network between RJB and CJB for short, open circuit. Check RJB and then CJB for related DTCs and refer to the relevant DTC Index
U300281	Vehicle Identification Number	<ul style="list-style-type: none"> Invalid serial data received 	Suspect the CJB has previously been installed to another vehicle. Check and install the original or a new CJB
U300317	Battery Voltage	<ul style="list-style-type: none"> Circuit voltage above threshold 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.
U300362	Battery Voltage	<ul style="list-style-type: none"> Mis-match in battery voltage, of 2 volts or more, between CJB and RJB 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system.

Rear Junction Box (RJB)

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Causes	Action
P046011	Fuel Level Sensor A Circuit	<ul style="list-style-type: none"> Fuel level sensor A analogue input circuit - short to ground 	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check fuel level sensor A analogue input circuit for short to ground
P046015	Fuel Level Sensor A Circuit	<ul style="list-style-type: none"> Fuel level sensor A analogue input circuit - short to power, open circuit 	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

All vehicles

1. Refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Refer to: [Cowl Side Trim Panel](#) (501-05 Interior Trim and Ornementation, Removal and Installation).

Left-hand drive vehicles

3.

All vehicles

4.

5.

Installation

1. To install, reverse the removal procedure.
2. Configure the CJB using the diagnostic tool.

Wiring Harnesses - Wiring Harness

Description and Operation

Introduction

CAUTION: Do **not** use any other heat shrink sleeve other than the approved glue lined heat shrink sleeve mentioned in the repair procedure.

The purpose of this document is to promote quick and efficient minor repair to harness connectors or cables using approved methods and the wiring harness repair kit. Repairs may only be made to cables and connectors which have been mechanically, **not electrically** damaged. It also applies where the whole extent of the damage can be clearly identified and rectified.

Care and neatness are essential requirements in making a perfect repair.

Caution:

At the time of this first issue of the Harness Repair Guide, do not approve repairs to any of the following circuits:

- Any media orientated system transport network harnesses.
- Supplement restraint system (SRS) firing circuits (Air bags).
- Link lead assemblies, which are unique to safety critical circuits such as anti-lock brake system (ABS) and thermocouple circuits. An example of this is the ABS wheel speed sensors with moulded connectors.
- 4. Screened cables, leads and wiring harness(s).

If any harness(s) with defective electrical connector terminals or wires from the above circuits are a concern, new components must be installed.

Repair Kit

CAUTION: Where the repair procedure indicates that a glue lined heat shrink sleeve should be applied, apply sufficient heat to the glue lined heat shrink to melt the glue in order to provide a water tight seal. Do **not** over heat the glue lined heat shrink sleeve so that the wiring harness insulation becomes damaged.

The wiring harness repair kit has been produced which comprises:

- Pre-terminated wiring harness(s) of different sizes and types
- Three sizes of butt splice connectors
- A selection of colored cable identification sleeves
- Two sizes of glue lined heat shrink sleeves
- Crimping pliers
- A wire cutter and insulation stripper
- An electrical connector terminal extraction handle and tips

A suitable heat source, for shrinking heat shrink sleeves will be required.

The pre-insulated diamond grip range of electrical connector terminals and in-line, butt splice connectors contained within the wiring harness repair kit are the **only** acceptable product for the repairs of wiring harnesses. The butt connectors not only grip the wire but also the insulation, making a very secure joint.

If an electrical connector terminal is not included in the wiring harness repair kit then approval for the repair is **NOT** given and in these circumstances a new wiring harness must be installed.

Pre-Terminated Wiring Harness(s) and Butt Splice Connectors

All pre-terminated wiring harness(s) and butt splice connectors in the wiring harness repair kit are contained in bags which can be resealed after use. Each bag is marked with the part number of the items stored within the bag. Each storage compartment in the wiring harness repair kit is identified with the corresponding part number. Make sure that pre-terminated wiring harness(s) and connectors are not mixed up it is advisable to only open one bag at a time and to reseat the bag securely before opening another bag. Also, replace the bag in its mating part number compartment within the case.

The pre-terminated wiring harness(s) are supplied with the insulation in one of three colors, red, blue or yellow. The colors do not apply to any particular circuit but to the harness wire size. See the Relationship Table in the Repair Method section.

Butt splice connectors are also supplied with red, blue or yellow coverings, which must be matched to the pre-terminated wiring harness insulation color.

Pre-Terminated Wiring Harness(s)

E130741

The illustration shows:

- The pre-terminated wiring harness(s) which are included in the wiring harness repair kit
- The part number of the pre-terminated wiring harness
- The letter showing the extractor tip which must be used to remove this type of electrical connector terminal
- Those electrical connector terminals which are gold

Some of the pre-terminated wiring harness(s) have seals installed to the insulation for sealed connector applications. It is essential for prevention of moisture ingress that a sealed pre-terminated wiring harness must be used where a sealed terminal was removed.

CAUTION: Where the repair procedure indicates that a glue lined heat shrink sleeve should be applied, apply sufficient heat to the glue lined heat shrink to melt the glue in order to provide a water tight seal. Do **not** over heat the

glue lined heat shrink sleeve so that the wiring harness insulation becomes damaged.

Two sizes of heat shrink sleeving are supplied in the wiring harness repair kit. Each heat shrink sleeve contains a sealant glue. These must be used when connecting wiring harness(s) or electrical connector terminal(s) at all times. The smaller diameter heat shrink sleeve is to be used with the red and blue butt splice connectors and the larger diameter sleeve with the yellow butt splice connectors.

For ease and speed, some of the pre-terminated wiring harness(s) may already have the insulation partly stripped at the splice end. If the repair requires insulation to be stripped from the cable, refer to the Relationship Table for the correct length of insulation to be stripped.

The Pre-Terminated Wiring Harness(s) illustration shows the electrical connector terminal type, the part number of the pre-terminated wiring harness and the letter of the extractor tip which must be used to extract the electrical connector terminal from the connector housing. Additionally, those electrical connector terminal(s) which are gold are identified, all others are therefore, tinned and not gold.

Wiring Harness Cable Identification Sleeves

A selection of colored sleeves are contained in the wiring harness repair kit for maintaining the wiring harness cable identification on the pre-terminated wiring harness. Place the correct colored sleeve(s) over the pre-terminated wiring harness insulation as near to the electrical connector as possible with the main wiring harness cable color nearest to the electrical connector.

For example, if the original wiring harness cable color is pink with a black trace put the pink wiring harness cable identification sleeve on the pre-terminated wiring harness first followed by a black sleeve, and slide both along the wiring harness cable to the electrical connector terminal.

Extraction Handle and Tips

The extraction handle, in conjunction with the correct tip, is used to remove a terminal from an electrical connector. Each tip contained in the wiring harness repair kit is marked with an identification letter, A to K inclusive. Each tip has been specially designed to extract a particular type of electrical connector terminal. The use of any other tool is **not** recommended and is liable to cause damage to the electrical connector. The tip is fastened to the handle by a screw which holds the tip firmly yet allows it to be easily replaced.

Extraction Handle and Tips

E130742

Insulation Stripper

The moving jaw has an adjuster wheel which has a series of holes in it. Turning the wheel and placing the cable in the matching size hole will automatically adjust the jaw to the correct pressure. Note that some wiring harness(s) may have a harder insulation and slight adjustment of the wheel may be needed to make a clean strip but exercise care not to damage the wire.

Insulation Stripper

E130743

By pressing the outer edges of the wiring harness cable length stop together the adjuster can be slid up or down the jaw. This decreases or increases the length by which the wiring harness cable insulation will be stripped from the pre-terminated wiring harness or wiring harness wire. The adjuster has a position indicator to align with a graduated scale and this sets the correct length in millimetres, of insulation to be stripped. The amount of insulation to be stripped is shown in the Relationship Table.

The illustration shows the insulation stripper tool and a wiring harness correctly gripped in the jaws. A wire cutter is provided on the outer side of the fixed jaw.

Cable Correctly Gripped in Stripper Blades

E130744

Crimping Pliers

Crimping Pliers

E130745

The crimping pliers have a moving jaw and a stationary jaw, with three different sized crimping enclosures. Each of the enclosures is identified by a red, blue or yellow coloured dot which corresponds to the three colours of the pre-terminated wiring harness(s) and butt splice connector colors.

List of Parts

Description	Part Number	Quantity
Wiring Harness Repair Kit	418-S065	1
Pre-Terminated Wiring Harness(s)	418-066 to 418-103 inclusive	10 each
Glue Lined Heat Shrink Pack – small diameter	418-104	25 per pack
Glue Lined Heat Shrink Pack – larger diameter	418-105	10 per pack
Case Assembly Comprising – carry case, lid, inner lid, base, insert, trays foam spacers	418-106	1
Butt Splice Connector – Red	418-107	50 per pack
Butt Splice Connector – Blue	418-108	50 per pack
Butt Splice Connector – Yellow	418-109	20 per pack
Extraction Tool Handle	418-110	1
Extraction Tip Pack consists of 2 spare screws plus	418-S111	1
Tip A	418-118	1
Tip B	418-119	1
Tip C	418-120	1
Tip D	418-121	1
Tip E	418-122	1
Tip F	418-123	1
Tip G	418-124	1
Tip H	418-125	1
Tip I	418-126	1
Tip J	418-127	1
Tip K	418-128	1
Sleeve Identification Pack – for Red insulation	418-112	500
Sleeve Identification Pack – for Blue insulation	418-113	500
Sleeve Identification Pack – for Yellow insulation	418-114	500
Instruction Manual	JTP 593	1
Crimping Pliers	YRW500010	1
Wire Stripping Tool	418-117	1

Repair Methods

CAUTION: Several different types and sizes of terminal may be found in a single electrical connector housing.

It is necessary to identify:

- The conductor (wire) size of the affected wiring harness
- The electrical connector range from which the damaged wiring harness is to be removed
- The terminal type

Use of the approved diagnostic tool will greatly assist in the quick identification of electrical connectors and faulty pin terminal(s).

Reference can also be made to the vehicle Electrical Guides, held by Dealers, to identify wiring harness(s) and electrical connector(s).

By using the Relationship Table, the wiring harness conductor (wire) size can be related to a suitable pre-terminated wiring harness by the color of the insulation. Also, the correct length of insulation to be stripped from the wiring harness lead is identified.

Relationship Table

CABLE RANGE	SPLICE	STRIP LENGTH
0.35 mm ² to 1.50 mm ²	RED	6.00 to 7.00 mm
1.00 mm ² to 2.50 mm ²	BLUE	6.00 to 7.00 mm
4.00 mm ² to 6.00 mm ²	YELLOW	9.00 to 9.50 mm

Electrical Connector Terminal Extraction

It must be noted that some electrical connector(s) have anti-backout devices which prevent the terminals from being removed from the electrical connector. Some examples of these are shown in following illustrations. The anti-backout device must be released before attempting to remove the terminal from the electrical connector. Some anti-backout devices require a special tip to release the device and these have been included in the kit. Most can be released by carefully using a suitable small screwdriver.

Various types of electrical connector have seals installed internally or externally to prevent moisture ingress. These normally do not have to be removed but make sure that they are installed when the electrical connectors are connected.

The illustrations show examples of each tip used on different types of electrical connector(s). There are a large number of different types of electrical connector used on vehicles therefore only one example using each tip is shown. Technicians experience and judgement will dictate which type of tip should be used for those electrical connector(s) which are not shown. Care should be exercised to avoid further damage when removing the terminals from the electrical connector.

- **NOTE: Examples of the extraction tips and anti-backout tips.**

Repair Procedure

• CAUTIONS:

Do not use crimping pliers, insulation strippers, butt splice connectors, heat shrink sleeves or pre-terminated wiring harness(s) that are not supplied with the Jaguar wiring harness repair kit. Each part has been designed to be used only with the other parts in this wiring harness repair kit.

Where the repair procedure indicates that a glue lined heat shrink sleeve should be applied, apply sufficient heat to the glue lined heat shrink to melt the glue in order to provide a water tight seal. Do **not** over heat the glue lined heat shrink sleeve so that the wiring harness insulation becomes damaged.

It is not correct to make more than five repair joints on the wiring harness to any electrical connector and if more damage is found at the same electrical connector then a new wiring harness must be installed.

- Remove the faulty terminal from the electrical connector using the extractor tool and correct tip. Make sure that any anti-backout device is released before trying to remove the terminal.
- **CAUTION:** : A number of electrical connector terminals are gold plated or gold flashed. When defective, they must be installed with a gold pre-terminated wiring harness(s) from the wiring harness repair kit. It is not always easy to identify the female as gold but the male pins are visually easier, therefore always check both male and female terminals to identify those which are gold. Under no circumstances are gold and tin terminals to be mixed as this will lead to early failure of the electrical contact.
 - **NOTE:** Never use a harness lead with a smaller diameter than the original harness lead.

Select the correct size and type of pre-terminated wiring harness and butt splice connector from the wiring harness repair kit.

- Using the wire cutter on the stripping tool, cut the pre-terminated wiring harness and the harness cable to the required length.
- **NOTE:** See illustration: **Stripping Insulation**

From the Relationship Table, find the correct length of insulation to be stripped from the pre-terminated wiring harness and set the adjustable cable length stop to the correct length. Place the pre-terminated wiring harness in the wire stripper and remove the insulation.

- Put the cable identification sleeve(s) on to the wiring harness with the main cable colour nearest to the terminal.
- During this next step do not overtighten. Place the selected butt splice connector in the crimping tool, matching the aperture and the butt connector colours. Make sure that the window indentation in the butt connector is resting over the guide bar on the lower jaw. Partially close the grip until the butt connector is securely held in the aperture. This will give support to the butt connector while the pre-terminated wiring harness is inserted into it.
- **NOTE:** See illustration: **Splice Correctly Located**

Insert the pre-terminated wiring harness into the butt connector and make sure that the wire is against the wire stop. Close the grip firmly, crimping the lead to the butt connector. When the handles have been completely closed the butt connector will be freed from the tool as the handles are released. If the handles have not been completely closed then the jaws will hold the butt connector and it cannot be removed from the tool until the crimp is fully made by closing the handles completely.

- Make sure that the harness cable has been squarely cut and the correct length of insulation removed. If more than one splice is needed the butt connectors must be not be crimped to the wiring harness at the same distance from the connector. The splices must be staggered to prevent a bulk of splices in the same area of the wiring harness.
- It is preferable to cover the butt splice joint with heat shrink sleeve. This is desirable not essential, except where the electrical connector is a sealed electrical connector. Use the smaller diameter sleeve for red and blue pre-terminated wiring harness(s) and the large diameter sleeve for the yellow pre-terminated wiring harness(s). It is advisable to place the heat shrink over the completed joint but in some instances the sleeve will not pass over the terminal. Check, and if required, place the correct size sleeve onto the harness cable or pre-terminated wiring harness before crimping the butt splice to the wiring harness.
- Place the harness cable into the butt splice with the splice window over the guide bar. Make sure that the cable harness wire is against the stop in the butt splice, crimp the butt splice connector to the wiring harness.
- Gently pull the harness cables each side of the butt splice to make sure that a secure joint has been made.
-  **WARNING:** Do not use a naked flame in areas where fuel or oil have been spilt. Clean the area of residual oil and fuel and wait until the fuel spill has fully evaporated.

• CAUTIONS:

When using a heat source make sure that it is localised and causes no damage to surrounding materials.

Where the repair procedure indicates that a glue lined heat shrink sleeve should be applied, apply sufficient heat to the glue lined heat shrink to melt the glue in order to provide a water tight seal. Do **not** over heat the glue lined heat shrink sleeve so that the wiring harness insulation becomes damaged.

Using a suitable heat source, shrink the sleeve over the butt splice.

- If further pre-terminated wiring harness(s) are to be installed to the same electrical connector, make sure that the lead is cut at a different length to the previous joint. This makes sure that the splices will, where possible, be staggered on the wiring harness and prevent a bulk of splices in one area.
- When all of the splices have been made, fit the terminal(s) to the electrical connector, taking care that the terminals are correctly orientated.
- Install the wiring harness cover and secure with adhesive electrical tape. Do not cover the wiring harness right to the electrical connector as the terminals must have a little movement and not be firmly bound to the electrical connector or wiring harness. Make sure that the cable identification sleeve(s) are showing at the wiring harness electrical connector.

Anti-Theft - Active - Anti-Theft - Active - Overview

Description and Operation

Overview

The active anti-theft system is available with three different levels of vehicle protection depending on market specification:

- Hinged panel sensing
- Hinged panel and intrusion sensing
- Hinged panel, intrusion and inclination sensing.

The [CJB \(central junction box\)](#) automatically arms and disarms the active anti-theft system when it functions the central locking system.

Refer to: [Handles, Locks, Latches and Entry Systems](#) (501-14 Handles, Locks, Latches and Entry Systems, Description and Operation).

Depending on market specification two modes of protection are used: perimeter mode and volumetric mode.

Perimeter mode

Perimeter mode, monitors the security of the hinged panels, which include:

- all doors,
- luggage compartment lid, and
- engine compartment lid.

When perimeter mode is active, the CJB monitors the panel ajar switches in the latch mechanisms of the hinged panels.

Volumetric mode

In volumetric mode the CJB monitors the interior of the vehicle for movement using an ultrasonic sound wave sensor.

If the battery backed sounder incorporates an inclination sensor the vehicle will also be monitored for unauthorised tilting; for example towing or jacking.

Anti-Theft - Passive - Anti-Theft - Passive - Overview

Description and Operation

Overview

The [PATS \(passive anti-theft system\)](#) prevents the vehicle's engine from being started by unauthorized persons.

Engine starting is prevented by inhibiting the fuel, engine (spark, injectors and crank) and ignition systems from operating.

This is achieved by using a uniquely coded Smart Key and an encoded data exchange between multiple control modules.

The system is automatic and requires no input from the driver.

The engine start system is initiated when the encoded data between the Smart Key and vehicle control modules is verified. The engine can then be started when the drive selector is in the 'Park' position, and the start/stop switch and the brake pedal are pressed simultaneously.

Anti-Theft - Passive - Anti-Theft - Passive - System Operation and Component Description

Description and Operation

10	Radio frequency receiver
11	Start control module

12	CJB (central junction box)
13	Instrument cluster
14	Megafuse (250 amp)

System Operation

The passive start function prevents the vehicle from being started by unauthorized persons. It does this by immobilizing the ignition, fuel and engine crank functions. The system is automatic and requires no input from the driver.

At the request of the [CJB](#), the keyless vehicle module prompts each of the Low Frequency (LF) antennae to output a signal. When the Smart Key is in the vehicle cabin, it detects the LF signals and responds with a Radio Frequency (RF) data-identification signal back to the keyless vehicle module via the RF receiver.

If the data received matches that stored in the keyless vehicle module it continues the passive start process by communicating a 'Smart Key valid' signal to the CJB via the medium speed [CAN \(controller area network\)](#) bus.

Once the CJB receives the authorization and confirms a response with an internal calculation, it passes the result to the instrument cluster on the medium speed CAN bus.

Before the instrument cluster sends a mobilization signal to the [ECM](#) it will exchange encrypted data with:

- The electric steering lock mechanism to authorize unlocking the steering column.
- The [RJB](#) to authorize fuel pump operation. Once the RJB receives the authorization and confirms the response with an internal calculation, it will enable the [FPDM \(fuel pump driver module\)](#).
- The CJB to authorize the ignition status. If the drive selector is in the park position and the driver presses the brake pedal and simultaneously presses the start/stop switch, the CJB interprets this as an engine crank request. Before the engine crank request is allowed, the CJB compares a brake pressure signal received from the [ABS](#) module. The brake pressure signal is compared to an internally stored threshold value within the CJB. If the signal is greater than the stored threshold value, a crank request signal is sent to the ECM on the high speed CAN bus.

Once these factors have been confirmed, and the vehicle is in 'Park', the engine can be started by pressing the brake pedal and the Stop/Start button simultaneously.

• **NOTE:** If the keyless vehicle module fails to locate the Smart Key, the message 'SMART KEY NOT FOUND PLEASE INSERT IN SLOT' will appear in the instrument cluster message center. When inserted the start control module will read the transponder within the Smart Key. If the transponder identification is valid, authorization will be transmitted to the instrument cluster on the [LIN \(local interconnect network\)](#) bus.

• **NOTE:** When the vehicle is delivered from the factory the passive start function is inhibited. In this condition the vehicle can only be started by placing the Smart Key in the start control module. The system should be switched on during the Pre-Delivery Inspection (PDI) using the Jaguar approved diagnostic system. For additional information, refer to the PDI Manual.

Component Description

Start Control Module

The start control module is used if the keyless vehicle module is unable to authorise the Smart Key.

If the keyless vehicle module is unable to identify the Smart Key, for example if the Smart Key battery voltage is low or there is local RF interference, the transponder within the Smart Key can be read in the conventional manner. The driver will be alerted to this by a chime and a message in the instrument cluster message center 'SMART KEY NOT FOUND PLEASE INSERT IN SLOT'.

Once inserted the start control module will read the transponder within the Smart Key. If the transponder identification is valid, authorization will be transmitted to the instrument cluster on the LIN bus.

• **NOTE:** Inserting the Smart Key into the start control module will not charge the Smart Key battery. The battery is non-chargeable and must be replaced if defective.

A message 'REMOVE SMART KEY' will be displayed if the Smart Key is still in the start control module and the driver's door is opened.

Low Frequency Antenna

Three Low Frequency (LF) antennae for the passive start system are positioned in specific locations in the vehicle; refer to Component Location graphic.

• **NOTE:** On vehicles with the passive entry system, five additional antennae are used; one integrated into the rear bumper and one in each door handle assembly. These are only used by the passive entry system and have no function in the passive start system.

Refer to: [Anti-Theft - Active \(419-01A Anti-Theft - Active, Description and Operation\)](#).

The keyless vehicle module transmits an LF signal via the antennae which is received by the Smart Key. The Smart Key then responds by transmitting a Radio Frequency (RF) signal which is received by the RF receiver and passed to the keyless vehicle module for authorization.

Keyless Vehicle Module

The keyless vehicle module controls signal transmissions to and from the Smart Key and provides authorization to allow the vehicle to be started. The module has a medium speed CAN connection to the CJB for authorizing vehicle starting.

Radio Frequency Receiver

The Radio Frequency (RF) receiver transmission is received from the Smart Key to enable key identification.

Anti-Theft - Passive - Anti-Theft - Passive

Diagnosis and Testing

Principle of Operation

For a detailed description of the Anti-Theft - Passive system, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (419-01B Anti-Theft - Passive)

[Anti-Theft - Passive](#) (Description and Operation),
[Anti-Theft - Passive](#) (Description and Operation),
[Anti-Theft - Passive](#) (Description and Operation).

Inspection and Verification

Anti-theft - Passive

The best method to confirm the correct operation of the Passive Anti-Theft System (PATS) is to check the LED (located in the center of the instrument panel). The LED should illuminate solid for 3 seconds, when the ignition status is set to ON, and then extinguish. This validates all PATS functions (i.e. the key transponder matches a stored key code, the challenge/response sequence between the respective modules was successful resulting in the EMS being enabled).

Ignition fails to operate

Check that the smart key is located within the vehicle interior, and that it is the correct one for the vehicle.

Insert the smart key into the start control unit (located at out board side of driver instrument panel lower panel), this is an alternative method to allow Ignition On/Engine Start.

Check that the start button circuit to the CJB is not open circuit or short circuit to power.

Check that the Low Speed CAN network is not malfunctioning, i.e. open circuit or short circuit. This would mean that the remote keyless entry module, Central Junction Box (CJB) and instrument cluster would be unable to communicate.

Engine fails to crank

If a PATS fault is detected, the LED will flash for 60 seconds at 4Hz with a 50% duty cycle. At the end of this period, the LED will flash a 2 digit code; this code is repeated 10 times. The meaning of these fault codes along with the frequency of flashing is given in the accompanying table. As a general rule a fault code of 16 or less will cause the vehicle not to crank. Additionally, the manufacturer approved diagnostic system should be used to check the instrument cluster, CJB & ECM for Diagnostic Trouble Codes (DTCs).

One potential occurrence for failing to crank could be due to the P & N start switch (input to the ECM).

Check the Crank Request output from the CJB to ECM is not short circuit to ground or open circuit.

Check the Starter Relay circuit.

• **NOTE:** On petrol engine variants, due to Smart Start, both sides of Relay Coil are switched directly from ECM (If conditions correct). On diesel engine variants the low side only is switched directly from the ECM.

Check that the Steering Column Lock correctly operates and the steering wheel can turn freely.

Check that the High Speed CAN network is not malfunctioning, i.e. the CAN circuit is open or short circuit. This would mean that the instrument cluster and ECM would be unable to communicate resulting in no Challenge being performed to enable the ECM. This would be supported by LED Flash Code 24, see PATS Fault Code Table.

Also check the CAN network between the ABS module and the CJB. The CJB uses the CAN_BrakePressureTMC signal to determine if the brake pedal has been pressed in order to allow an engine crank. The CJB uses a value of 0x05, if the CJB sees a value less than this, it will not enable the Crank Request Output.

Engine cranks but will not start

If the Engine is cranking it means that the ECM has passed the authorisation required with the Instrument Cluster. If this authorisation failed, the ECM would not engage the starter relay. This could be confirmed by verifying the PATS LED prove out (illuminated solid for 3 seconds) or by reading DTCs from the instrument cluster and ECM.

In this case, the fuel pump circuit should be verified. The Fuel Pump Delivery Module (FPDM), which is supplied via the RJB (authentication required with the instrument cluster) and controlled by the ECM, supplies the fuel pump.

In all cases of suspected non-start issues, the most logical failure modes should be eliminated first. i.e.

- Check all relevant supplies and grounds to the relevant modules listed herein.
- Note any unusual behaviour from other systems/functionality.
- Note any functions that are not operating as expected.

PATS Fault Codes

For the various PATS modes/faults listed in the table, the instrument cluster will store a DTC and indicate this to the customer during the detection period defined in the 'when logged' column, by illuminating the indicator as described for 60 seconds and then flashing the LED 10 times as appropriate. The indication will stop immediately the ignition status is set to OFF any time during the fault indication sequence. Up to 4 DTCs could be stored per key read sequence (1-10 read attempts). No DTCs will be stored until all retry attempts are complete. Only the highest priority fault code will be flashed.

To determine the fault code from the LED: The LED will flash initially ten times with 1.5 seconds between. The LED will remain OFF for 2.5 seconds then flash a number of times with 0.5 seconds between (the number of times the LED flashes represents the first digit of the code), the LED will remain OFF for 1.5 seconds then flash a number of times with 1.5 seconds between (the number of times the LED flashes represents the second digit of the code).

The PATS LED will be commanded on as shown under 'indication'. Normal PATS operations are complete within 400ms of the ignition switch transition from OFF to ON or START, worst case for ECM communication problems will be less than 2 seconds. If PATS is not complete during the 2 seconds the ECM will terminate PATS and await the next ignition ON or START event. PATS faults will be indicated via the LED as soon as possible and will terminate the LED prove out. At ignition OFF all previous flashing will cease and the perimeter anti-theft system will control the LED when the vehicle is locked and armed.

PATS Fault Code Table

Mode of Operation/Fault	When Logged	Ignition Status	DTC	LED Fault Code	Indication
Prove out	N/A	Transition from OFF to ON	N/A	N/A	3 Seconds of steady illumination
Perimeter Anti-theft Control	N/A	OFF - Vehicle locked and armed	N/A	N/A	Off or 0.5Hz flashing at 5% duty cycle \pm 20% until Off
Start Control Unit already programmed	Key Insert	Any	B1B0105	N/A	No Indication
Start Control Unit status = invalid response	Key Insert	Any	B1B0167	N/A	No Indication
Start Control Unit programming error	Key Insert	Any	B1B0151	N/A	No Indication
Start Control Unit challenge response error	Key Insert	OFF	B1B0162	N/A	No Indication
Key Programming timer expired or Key Auth Timer expired	Key Insert	Any	B1B0187	N/A	No Indication
Transponder challenge response error	Key Insert	Any	B1B0164	N/A	No Indication
Transponder keys stored below minimum number required	B&A/Dealer	Any	B1B0100	N/A	No Indication
Transponder not programmed	B&A/Dealer	Any	B1B0155	N/A	No Indication
If the instrument cluster sends a 'theft' key status to the ECM or the ECM returns a status message containing the data 'Disabled/Theft', the instrument cluster will set this DTC	EMS CAN communication	OFF to ON	B1B3364	16	60 seconds of 4Hz flashing at 50% duty cycle followed by fault code 16 flashing 10 times
During manufacturing a Target ID is transferred from the ECM when requested by the instrument cluster. The instrument cluster stores this unique vehicle number in EEPROM. If this ID fails to store in EEPROM correctly, the instrument cluster will set this DTC	B&A/Dealer	OFF to ON	B1B3305	22	60 seconds of steady indication followed by fault code 22 flashing 10 times
If the status message received from the ECM contains the data challenge response error, the instrument cluster will set this DTC	Challenge/Response	OFF to ON	B1B3362	23	60 seconds of steady indication followed by fault code 23 flashing 10 times
After the instrument cluster has transmitted its first PATS idle message, it will start a 2 second timer running. If the PATS sequence does not complete (Cluster received the Enable msg) within this time period the instrument cluster will set this DTC	Idle message missing	OFF to ON	B1B3387	24	60 seconds of steady indication followed by fault code 24 flashing 10 times

1. **1.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
2. **2.** If the cause is not visually evident, verify the symptom and refer to the manufacturer approved diagnostic system.

System Operation

Anti-Theft - Active

The active anti-theft system is available with three different levels of vehicle protection depending on market specification:

- Hinged panel sensing
- Hinged panel and intrusion sensing
- Hinged panel, intrusion and inclination sensing.

The system is controlled by software in the [CJB](#) and [RJB](#) and indicates a trigger condition:

- Visually, using the direction indicators, and
- Audibly, using the vehicle horn and either a passive or active sounder to indicate a trigger condition.

The passive sounder takes the form of an anti-theft disc horn located at the rear of the engine compartment on the [LH](#) side. The active sounder takes the form of a battery backed sounder located in the same position.

Depending on market specification, the battery backed sounder may be fitted with an inclination sensor. Both types of battery backed sounder are visually identical and can only be identified by their part number. Both are also intelligent units, and communicate to the CJB over a [LIN \(local interconnect network\)](#) bus connection.

Monitoring of the hinged panels is carried out using switches located in each door latch assembly, the engine-compartment-lid latch assembly, and the luggage-compartment-lid latch assembly. The condition of the switches is monitored by the CJB.

Monitoring of front door lock status is carried out using switches located in the door latch mechanisms. The condition of the switches is monitored by the front door modules and transmitted to the CJB over the medium speed [CAN \(controller area network\)](#) bus.

Monitoring of the cabin interior is carried out using an intrusion detection module mounted behind the roof console. The intrusion detection module comprises an ultrasonic sound wave sensor to determine if there is movement within the cabin.

Information from the intrusion detection module is communicated to the CJB over a LIN bus connection.

• CAUTIONS:

The intrusion detection module electrical connections, particularly those to the sensors mounted in the roof console, are very delicate and must be handled with care.

The intrusion detection module is an electro-statically sensitive part and should only be handled in an electro-statically controlled environment.

When armed, the active anti-theft system can be triggered in one of the following ways:

- A door ajar switch indicates a door has been opened.
- The engine compartment lid or luggage compartment lid ajar switches indicate that either has been opened.
- Either front door latch mechanism indicates a door has been unlocked.
- The emergency key blade is used to open either the LH front door or luggage compartment.
- The CJB or RJB are disconnected (this may result in only a partial trigger).
- An attempt is made to start the engine without a valid signal from the Smart Key.
Refer to: [Anti-Theft - Passive](#) (419-01B Anti-Theft - Passive, Description and Operation).
- The battery backed sounder is disconnected (partial trigger only).
- The vehicle battery is disconnected on a vehicle fitted with a battery backed sounder (partial trigger only).
- The inclination sensor detects a change in vehicle attitude.
- The intrusion detection module detects movement within the cabin.

Component Description

Door Modules

The door modules provide the interface between the door latch-motors, the door latch-switches and the CJB. The door modules provide door switch status information and enable the door latch-motors on request from the CJB or the keyless

vehicle module.

Keyless Vehicle Module

The keyless vehicle module interfaces with the Central locking, Radio Frequency (RF) receiver and collects RF signal information which is transmitted from the Smart Key. This information is translated into commands which are passed on the medium speed CAN bus to the:

- CJB,
- RJB,
- door modules, and
- instrument cluster.

The keyless vehicle module also monitors:

- 2 interior antennae,
- 1 luggage compartment antenna,
- a rear bumper antenna, and
- 4 door handle antennae if the passive entry system is fitted.

On vehicles with passive entry, the additional fast latch motors are controlled via the keyless vehicle module and the locking status is passed to the CJB on the medium speed CAN bus.

Instrument Cluster

The instrument cluster controls the alarm indicator, and in conjunction with the [ECM \(engine control module\)](#), the engine immobilization. The ECM controls the engine crank and fuel functions and the instrument cluster processes the valid transponder information.

Alarm Indicator

The alarm indicator is a [LED \(light emitting diode\)](#) located in the body of the sunload/light sensor. When the ignition is off the indicator gives a visual indication of the active anti-theft system to show if the alarm system is active or not active. Operation of the alarm indicator is controlled by the instrument cluster which varies the flash rate of the LED to indicate the system status of the alarm and the immobilization systems.

When the ignition is on, the indicator provides a visual indication of the status of the passive anti-theft (engine immobilization) system. If the immobilization system is operating correctly, the LED will be illuminated for 3 seconds at ignition on and then extinguish. If a fault exists in the immobilization system, the LED will be either permanently illuminated or flashing for 60 seconds. This indicates that a fault exists and fault code has been recorded. After the 60 second period the LED will flash at different frequencies which indicate the nature of the fault. Refer to: [Anti-Theft - Passive](#) (419-01B Anti-Theft - Passive, Description and Operation).

Passive Anti-Theft Horn

The passive anti-theft horn is hardwired to the CJB which activates the horn when the alarm is triggered.

Battery Backed Sounder

Operation of the battery backed sounder is controlled by the CJB on the LIN bus. The sounder is also connected with a permanent battery supply via the CJB. An integral, rechargeable battery powers the sounder if the battery power supply from the CJB is interrupted.

Dependant on vehicle, a incitation sensor is incorporated into the battery backed sounder, to monitor vehicle attitude, see Inclination Sensor.

Inclination Sensor

The CJB monitors the inclination sensor and will activate the alarm system if the vehicle is being raised.

Intrusion Detection Module

The intrusion detection module comprises an ultrasonic sound wave sensor which monitors the vehicle's interior.

The intrusion detection module is activated with volumetric mode which in turn is enabled when the vehicle is double locked. The vehicle can be locked and alarmed with the module de-activated if a pet is to be left in the vehicle for example by single-locking the active anti-theft system. The intrusion detection modules can also be de-activated by deselecting the 'Alarm Sensors' option in the 'Vehicle Settings' screen on the Touch Screen Display.

• **NOTE:** The Touch Screen method of de-activation of the intrusion detection module is only for one arm cycle, it will revert to active once the engine is next started.

When the volumetric mode is active and the vehicle battery voltage falls below 9 volts, the CJB will ignore any inputs from the intrusion detection module to prevent false alarm activation.

Anti-Theft - Active - Anti-Theft - Active

Diagnosis and Testing

Principles of Operation

For a detailed description of the anti-theft - active system, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (419-01A Anti-Theft - Active)

[Anti-Theft - Active](#) (Description and Operation),
[Anti-Theft - Active](#) (Description and Operation),
[Anti-Theft - Active](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Door latch micro switches ● Hood ajar switch ● Passive anti-theft alarm horn (if installed) ● Battery backed sounder (if installed) or battery backed sounder with tilt sensor (if installed) ● Vehicle horns 	<ul style="list-style-type: none"> ● Fuse(s) ● Electrical connector(s) ● Wiring Harness

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the relevant DTC Index.

• NOTE: For Remote Keyless Entry system failures.
 REFER to: [Remote Keyless Entry \(RKE\) Module](#) (419-10 Multifunction Electronic Modules, Diagnosis and Testing).

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).

• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Removal and Installation

Removal

1. Remove the interior lamp lens.

E99917

2. Release the interior lamp.

E100363

4. Remove the global positioning sensor (GPS) antenna.
3.  CAUTION: Make sure that the latch is pressed before disconnecting the electrical connector.

Installation

Release and disconnect the 2 electrical connectors.

- Remove the 2 nuts.
- Remove the reinforcement plate.

E101388

1. To install, reverse the removal procedure.

- Tighten to 6 Nm.

Navigation System - Navigation System Module

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the LH luggage compartment side trim panel.
For additional information, refer to: [Loadspace Trim Panel LH](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Release the navigation system module.

4. Remove the navigation system module.

Installation

1. Install is the reverse of removal.
2. Tighten to 10 Nm.

Cellular Phone - Bluetooth Module

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the front seat.
3. Lift the carpet for access.

E101402

4. Disconnect the 2 electrical connectors.

E101404

5. Remove the bluetooth module.

E101403

Installation

1. Install is the reverse of removal.

- Tighten to 10 Nm.

E101403

Multifunction Electronic Modules - Module Controlled Functions - Overview

Description and Operation

OVERVIEW

The vehicle electrical system comprises a number of control modules which are interconnected via several network systems.

The following network systems are used on the vehicle:

- High speed CAN (controller area network) bus
- Medium speed CAN bus
- LIN (local interconnect network) bus
- K Bus
- Media Orientated Systems Transport (MOST) ring.

Multifunction Electronic Modules - Module Controlled Functions - System Operation and Component Description

Description and Operation

System Operation

MODULE CONTROLLED FUNCTIONS

Refer to the relevant section for details of system operation.

Component Description

MODULES, SYSTEMS AND FUNCTION

The **CJB (central junction box)** is the 'gateway' for the network systems which allows information to be exchanged between networks.

The entertainment system components are connected on a fiber optic MOST ring. The MOST ring can send and receive information to/from the other network systems via a 'gateway' in the Integrated Control Module.

The following table shows each vehicle control module, the network system to which it is connected, its function and location in the vehicle.

Module	Network System	Function	Vehicle Location
Instrument cluster	High speed CAN (controller area network) bus	Receives data from other vehicle systems to provide information to the driver. Also functions as the gateway for the bus systems.	Instrument panel.
Steering column	High speed CAN bus	Controls the locking and unlocking of the steering column.	Upper steering column.
Diagnostic socket	High speed CAN bus	Allows the transfer of vehicle information using a Jaguar approved diagnostic system or other diagnostic tool.	In the lower instrument panel on the driver's side, adjacent to the start control module.
RCM (restraints control module)	High speed CAN bus	Controls the deployment of the supplementary restraint components.	At rear of floor console.
TCM (transmission control module)	High speed CAN bus	Controls automatic transmission operation.	Inside the transmission and accessible via the fluid pan.
ECM (engine control module)	High speed CAN bus	Controls engine management and fuel system operation.	Rear of the engine compartment on the bulkhead.
ABS (anti-lock brake system)	High speed CAN bus	Controls all aspects of the braking system	Rear of the engine compartment on the bulkhead.
Headlamp leveling module	High speed CAN bus	Controls the static dynamic headlamp leveling function.	In the lower instrument panel, behind the glovebox.
Occupant classification system control module (NAS only)	High speed CAN bus	Detects when a passenger is in the front passenger seat and can determine their size and weight.	Below the front passenger seat.
Adaptive damping control module	High speed CAN bus	Controls the adjustment of the dampers.	Below the front passenger seat.
Electronic Parking Brake (EPB) module	High speed CAN bus	Controls the application and release of the electronic parking brake.	In the luggage compartment, above the RH (right-hand) wheel arch.
Pedestrian protection module	High speed CAN bus	Controls and monitors the pedestrian protection system.	LH (left-hand) 'A' pillar.
Adaptive speed control module	High speed CAN bus	Controls the vehicle's road speed in relation to other vehicles when in speed control mode.	Behind the instrument panel on the driver's side.
Electronic transmission selector	High speed CAN bus	Allows the driver to electronically select the required automatic transmission mode. Transmits driver selections to the TCM .	In the floor console.
Jaguar Drive control module	High speed CAN bus	Controls the Jaguar Drive function and communicates with other system modules.	Integral with the electronic transmission selector software in the floor console.
CJB	Medium speed CAN bus	Controls body functions and power distribution.	On RH 'A' pillar.
Diagnostic socket	Medium speed CAN bus	Allows the transfer of vehicle information using a Jaguar approved diagnostic system or other diagnostic tool.	In the lower instrument panel on the driver's side, adjacent to the start control module.
Passenger door module	Medium speed CAN bus	Controls window and locking functions.	In the front passenger door.
Parking aid module	Medium speed CAN bus	Controls the parking aid system.	In the LH side of the luggage compartment, adjacent to the keyless vehicle module.
Driver's seat module	Medium speed CAN bus	Controls driver's seat positioning and also memory functions of other personalized functions.	Below the driver's seat.

Module	Network System	Function	Vehicle Location
Instrument cluster	Medium speed CAN bus	Receives data from other systems to provide driver information.	In the instrument panel.
Driver's door module	Medium speed CAN bus	Controls window and locking functions.	In the driver's door.
ATC (automatic temperature control) module	Medium speed CAN bus	Contains controls for the heating and air conditioning systems.	On the end of the air conditioning evaporator and blower assembly.
Information control module	Medium speed CAN bus	Contains controls for the entertainment systems.	In the instrument panel below the integrated control panel.
Integrated control panel	Medium speed CAN bus	Contains controls for the entertainment systems and gateway between audio system and other vehicle systems.	In the instrument panel.
Front seat climate control module	Medium speed CAN bus	Controls the temperature requirements of the driver and passenger front seats.	Below the RH front seat.
LH blind spot monitoring module	Medium speed CAN bus	Controls the operating parameters of the system and provides driver indications and fault monitoring.	Behind the outer part of the rear bumper, rearward of the rear wheel.
RH blind spot monitoring module	Medium speed CAN bus	Controls the operating parameters of the system and provides driver indications and fault monitoring.	Behind the outer part of the rear bumper, rearward of the rear wheel.
Keyless vehicle module	Medium speed CAN bus	Allows the vehicle to be opened and closed without the use of a key.	In the LH side of the luggage compartment, adjacent to the parking aid module.
RJB (rear junction box)	Medium speed CAN bus	Controls body functions and power distribution.	RH of luggage compartment.
Tire pressure monitoring control module	Medium speed CAN bus	Monitors the vehicle tires to warn of deflation.	Below the rear of the floor console.
TCM	K Bus	Data transfer between TCM and diagnostic socket. NOTE: Only fitted to early build vehicles.	Inside the transmission and accessible by removal of the fluid pan.
Driver's side rear door module	LIN (local interconnect network)	Controls window and locking operation.	In the driver's side rear door.
Passenger side rear door module	LIN	Controls window and locking operation.	In the passenger side rear door.
Driver's door module	LIN	Memory/adjustment functions for seat, steering column and mirrors and door security functions.	In the driver's door.
Passenger front door module	LIN	Memory/adjustment functions for seat, steering column and mirrors and door security functions.	In the passenger door.
Driver's door switches	LIN	Transmit driver selections to the driver's door module.	In the driver's door panel.
ECM	LIN	Receives a load signal from the generator.	In the engine compartment on the bulkhead.
Generator	LIN	Provide load signal to the ECM.	On the LH side at the front of the engine.
Driver's seat module	LIN	Control position of driver's seat.	Below the driver's seat on the floor pan.
Driver's seat switches	LIN	Provide driver selection inputs to the driver's seat module.	On the outside of the trim panel on the driver's seat.
Air quality sensor	LIN	Measures quality of air entering the vehicle interior.	At the front of the vehicle, behind the air intake grill.
Windshield (defrost) stepper motor	LIN	Moves flaps within the heater assembly to direct air flow to the windshield.	On the heater assembly.
Face/feet stepper motor	LIN	Moves flaps within the heater assembly to direct air flow to instrument panel vents and/or footwell.	On the heater assembly.
LH temperature blend stepper motor	LIN	Moves flaps within the heater assembly to control temperature in LH side footwell.	On the heater assembly.
RH temperature blend stepper motor	LIN	Moves flaps within the heater assembly to direct air flow to RH side footwell.	On the heater assembly.
Electric booster heater	LIN	Controls operation of the electric booster heater.	Inside the heater assembly.
LH outer face level vent	LIN	Controls the operation of the face level vent stepper motor.	In the instrument panel.
LH inner face level vent	LIN	Controls the operation of the face level vent stepper motor.	In the instrument panel.
RH inner face level vent	LIN	Controls operation of the face level vent stepper motor.	In the instrument panel.
RH outer face level vent	LIN	Controls operation of the face level vent stepper motor.	In the instrument panel.
ATC module	LIN	Controls operation of the climate system functions.	In the instrument panel.
Steering wheel audio switches	LIN	Converts analogue signals from steering wheel switches into digital messages.	On the steering wheel.
Steering wheel clockspring	LIN	Passes digital messages from the steering wheel audio switches to the instrument cluster.	Behind the steering wheel, on the upper steering column.
Instrument cluster	LIN	Receives digital signals from other vehicle systems.	On the driver's side of the instrument panel.

Module	Network System	Function	Vehicle Location
Battery backed sounder	LIN	Activated by CJB when alarm trigger is received.	In the LH side of the engine compartment, near the bulkhead.
CJB	LIN	Controls body functions and power distribution.	On the RH 'A' pillar.
RJB	LIN	Controls body functions and power distribution.	On the RH of the luggage compartment.
Battery monitoring system module	LIN	Monitors the condition and charge of the vehicle battery.	On the vehicle battery positive terminal in the luggage compartment.
Intrusion detection module	LIN	Detects movement in the vehicle interior and activates the anti-theft system.	In the front overhead console.
Rain/light sensor	LIN	Detects ambient light levels and moisture on the windscreen for operation of the automatic headlamps and wiper systems.	On the inside of the windshield behind the interior rear view mirror.
Start control module	LIN	Used to identify the Smart Key - component of the keyless start system.	In the lower instrument panel on the driver's side.
Rear view camera	LIN	Passes digital images data from the rear view camera to the RJB	In the luggage compartment lid trim finisher.
Driver's window switch	LIN	Controls operation of the driver's window.	In the driver's door trim panel.
Electronic transmission selector	LIN	Sends selector position to the TCM .	In the floor console.
TCM	LIN	Receives selector position information to control the transmission.	Inside the transmission and accessible by removal of the fluid pan.
Information control module	Media Oriented System Transport (MOST)	Contains controls for the entertainment system and gateway between audio system and other vehicle systems.	In the instrument panel below the integrated control panel.
Integrated control panel	MOST	Contains controls for the entertainment system.	In the instrument panel.
Digital Audio Broadcast (DAB) receiver (SDARS NAS only)	MOST	Receives digital radio broadcasts.	In the LH side of the luggage compartment, above the keyless vehicle module.
Bluetooth® phone module	MOST	Controls operation of the Bluetooth® phone system.	Below the LH front seat, adjacent to the portable audio module.
Amplifier/tuner	MOST	Provides amplification for the entertainment systems and reception of radio RF broadcasts.	In the LH side of the luggage compartment.
Navigation computer	MOST	Reads map data from a DVD (digital versatile disc) to calculate and display visual route guidance information via the TSD and audible guidance via the amplifier to the driver.	In the LH side of the luggage compartment.
Touch Screen Display (TSD)	MOST	Provides the driver interface to the entertainment, navigation and driver personalization functions.	In the center of the instrument panel.
TV tuner	MOST	Controls the reception of television signals and audio/visual inputs.	In the LH side of the luggage compartment.
Portable Audio Module	MOST	Controls the auxiliary inputs for additional audio inputs via the portable audio interface.	Below the LH front seat, adjacent to the Bluetooth® phone module.
MOST diagnostic connector	MOST	Allows for diagnostic fault detection of the MOST ring.	Below the air ducting in the floor console.

Refer to Communications Network section for further details.

Multifunction Electronic Modules - Driver Door Module (DDM)

Diagnosis and Testing

Description and Operation

For a detailed description of the multifunction electronic control modules, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (419-10 Multifunction Electronic Modules)

[Module Controlled Functions](#) (Description and Operation),
[Module Controlled Functions](#) (Description and Operation),
[Module Controlled Functions](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Electrical
<ul style="list-style-type: none"> ● Fuse(s) ● Electrical connector(s) ● Wiring Harness

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).

• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

U300281	Vehicle Identification Number	<ul style="list-style-type: none"> Vehicle/component mis-match. Module previously installed to other vehicle 	Install correct/new module to vehicle specification, refer to the new module/component installation note at the top of the DTC Index
U300362	Battery Voltage	<ul style="list-style-type: none"> Mis-match in battery voltage, of 2 volts or more, between remote keyless entry module and RJB 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system

Multifunction Electronic Modules - Passenger Door Module (PDM)

Diagnosis and Testing

Description and Operation

For a detailed description of the multifunction electronic control modules, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (419-10 Multifunction Electronic Modules)

[Module Controlled Functions](#) (Description and Operation),
[Module Controlled Functions](#) (Description and Operation),
[Module Controlled Functions](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Electrical
<ul style="list-style-type: none"> ● Fuse(s) ● Electrical connector(s) ● Wiring Harness

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).

• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action
B10EB11	Driver door double locking motor	<ul style="list-style-type: none"> ● Driver door double locking motor control circuit - short to ground 	Refer to the electrical circuit diagrams and test driver door double locking motor control circuit for short ground

Multifunction Electronic Modules - Driver Door Module (DDM)

Removal and Installation

Removal

1. Refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Refer to: [Front Door Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3.

Installation

1. To install, reverse the removal procedure.
2. If a new component has been installed, configure using Jaguar approved diagnostic equipment.

Multifunction Electronic Modules - Driver Seat Module (DSM)

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Make the air bag supplemental restraint system (SRS) safe.

Refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).

2. Refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).

3.

Installation

1. To install, reverse the removal procedure.

2. If a new component has been installed, configure using Jaguar approved diagnostic equipment.

Multifunction Electronic Modules - Passenger Door Module (PDM)

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Refer to: [Front Door Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3.

Installation

1. To install, reverse the removal procedure.

Multifunction Electronic Modules - Rear Door Module (RDM)

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Refer to: [Rear Door Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Torque: 1.5 Nm

Installation

1. To install, reverse the removal procedure.

Front End Body Panels -

Description	Nm	lb-ft	lb-in
Air deflector retaining nuts	7	-	62
Air deflector retaining bolts	7	-	62

Body Closures - Front Door

Removal and Installation

Removal

1. NOTE: The front door is manufactured from mild steel, it contains a side impact reinforcement manufactured from boron steel.

The front door is serviced as a separate bolt-on panel.

E 106476

2. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) /
[Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) /
[Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
3. NOTE: If the procedure includes removal of the front door components, the battery can remain connected to aid their removal and disconnected afterwards.
- Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
4. NOTE: For new front door installation, this step may be carried out later in the removal procedure.
- Disconnect the front door wiring harness, accessed behind the grommet on the A-pillar.
5. NOTE: For new front door installation, this step may be carried out later in the removal procedure.
- Release the front door check strap from the body.
6. NOTE: This step is for removing the fully trimmed front door for access only, for installing a new front door, continue to removal step 7.
- Remove the front door upper and lower hinge pivot bolts and lift the front door to remove.

E103517

7. Remove the front door window regulator and motor.
For additional information, refer to: [Front Door Window Regulator and Motor](#) (501-11 Glass, Frames and Mechanisms, Removal and Installation).
8. Remove the exterior mirror.
For additional information, refer to: [Exterior Mirror](#) (501-09 Rear View Mirrors, Removal and Installation).
9. Remove the front door latch.
For additional information, refer to: [Front Door Latch](#) (501-14 Handles, Locks, Latches and Entry Systems, Removal and Installation).
10. Remove the front door outer window frame mouldings.
11. Remove the front door weatherstrips.
12. Remove the front door wiring harness.
13. Remove the front door impact absorbers.
14. Remove the front door check strap.
15. Remove the front door glass run felt.
16. Remove any miscellaneous front door clips, grommets and blanking covers.
17. NOTE: If new hinges are being installed, install the complete hinges to the A-pillar. To align the hinges at the A-pillar it will be necessary to remove the front fender.

E106477

Remove the upper and lower front door hinge fixing bolts and remove the front door.

Installation

1. NOTE: If the front door has been removed for access only, it can be installed back on to its upper and lower hinge pivots and secured with the upper and lower hinge pivot bolts.

Offer up the front door and loosely install the front door hinge bolts.

2. Check alignment, if correct, proceed to next step, if not, rectify and recheck before proceeding.

3. Tighten the front door hinge bolts to 30 Nm.

4. When correctly aligned and with the front door hinge bolts tightened, the new front door can be removed at its upper and lower hinge pivot bolts for refinishing.

5. NOTE: Install the front door upper frame weatherstrip prior to installing the front door.

The installation of associated panels and components is the reversal of removal procedure.

- Tighten the front door upper and lower hinge pivot bolts to 30 Nm.

Body Closures - Fuel Filler Door

 - Release the clip.

Installation

1. To install, reverse the removal procedure.

Body Closures - Luggage Compartment Lid

Removal and Installation

Removal

1. NOTE: The luggage compartment lid is manufactured from mild steel.

The luggage compartment lid is serviced as a separate bolt-on panel, less its hinges.

E 103477

2. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
3. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
4. Remove the loadspace trim panel RH.
For additional information, refer to: [Loadspace Trim Panel RH](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
5. Disconnect the luggage compartment lid wiring harness.

E 108483

6. NOTE: This step requires the aid of another technician.

Remove the luggage compartment lid.

7. NOTE: Do not disassemble further if the component is removed for access only.

Remove the luggage compartment lid moulding.
For additional information, refer to: [Luggage Compartment Lid Moulding](#) (501-08 Exterior Trim and Ornammentation, Removal and Installation).

- 8.** Remove the luggage compartment lid latch actuator.
For additional information, refer to: [Luggage Compartment Lid Latch Actuator](#) (501-14 Handles, Locks, Latches and Entry Systems, Removal and Installation).
- 9.** Remove both rear fog lamps.
For additional information, refer to: [Rear Fog Lamp](#) (417-01 Exterior Lighting, Removal and Installation).
- 10.** Remove both luggage compartment lid buffers.
- 11.** Remove the luggage compartment lid wiring harness.
For additional information, refer to: [Luggage Compartment Lid Wiring Harness](#) (418-02 Wiring Harnesses, Removal and Installation).
- 12. NOTE:** Where it is not practical to re-use the luggage compartment lid badges, they should be renewed, therefore removal is not required.

Remove the luggage compartment lid badges.

Installation

- 1. NOTE:** This step requires the aid of another technician.

Offer up the panel and loosely install the luggage compartment lid hinge retaining nuts.

E103478

2. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
3. Tighten the luggage compartment lid hinge retaining nuts to 25 Nm.
4. The installation of associated panels and components is the reversal of removal procedure.

Body Closures - Rear Door

Removal and Installation

Removal

1. NOTE: The rear door is manufactured from mild steel, it contains a side impact reinforcement manufactured from boron steel.

The rear door is serviced as a separate bolt-on panel.

[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

3. NOTE: If the procedure includes removal of the rear door components, the battery can remain connected to aid their removal and disconnected afterwards.

Disconnect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

4. NOTE: For new rear door installation, this step may be carried out later in the removal procedure.

Disconnect the rear door wiring harness, accessed behind the grommet on the B-pillar.

5. NOTE: For new rear door installation, this step may be carried out later in the removal procedure.

Release the rear door check strap from the body.

6. NOTE: This step is for removing the fully trimmed rear door for access only, for installing a new front door, continue to removal step 7.

Remove the rear door upper and lower hinge pivot bolts and lift the rear door to remove.

E103525

7. Remove the rear door fixed window glass.
For additional information, refer to: [Rear Door Fixed Window Glass](#) (501-11 Glass, Frames and Mechanisms, Removal and Installation).
8. Remove the rear door latch.
For additional information, refer to: [Rear Door Latch](#) (501-14 Handles, Locks, Latches and Entry Systems, Removal and Installation).
9. Remove the rear door outer window frame mouldings.
10. Remove the rear door weatherstrips.
11. Remove the rear door wiring harness.
12. Remove the rear door impact absorbers.
13. Remove the rear door check strap.
14. Remove the rear door glass run felt.
15. Remove any miscellaneous rear door clips, grommets and blanking covers.

16. NOTE: If new hinges are being fitted, install the complete hinges to the B-pillar.

Remove the upper and lower rear door hinge bolts and remove the rear door.

E106479

Installation

1. **NOTE:** If the rear door has been removed for access only, it can be installed back on to its upper and lower hinge pivots and secured with the upper and lower hinge pivot bolts.

Offer up the rear door and loosely install the rear door hinge bolts.

2. Check alignment, if correct, proceed to next step, if not, rectify and recheck before proceeding.
3. Tighten the rear door hinge bolts to 30 Nm.
4. When correctly aligned and with the rear door hinge bolts tightened, the new rear door can be removed at its upper and lower hinge pivot bolts for refinishing.

5. The installation of associated panels and components is the reversal of removal procedure.

- Tighten the rear door upper and lower hinge pivot bolts to 30 Nm.

3	Interior mirror
4	Drivers door control module
5	Mirror control switch
6	Drivers door mirror

Rear View Mirrors - Rear View Mirrors - Overview

Description and Operation

Overview

The exterior mirrors incorporate the following:

- Blind spot monitoring indicator
- Auto dimming function
- Turn signal indicators
- Approach lamps
- Exterior temperature sensor
- Heated mirror function
- Reverse dipping function

Movement of the door mirrors is controlled from a switch pack located on the drivers door. The switch pack contains 2 non-latching mirror select buttons labeled 'L' and 'R' and a 4-way mirror movement switch. Door mirror movement commands are transmitted to the driver's door module over the [LIN \(local interconnect network\)](#) bus. The drivers door module transmits any mirror movement commands to the passenger door module over the medium speed [CAN \(controller area network\)](#) bus.

Movement of the door mirrors is carried out by the respective door module. The door modules provide supply and ground paths to the mirror motors and monitor mirror position via potentiometers located in the mirror housings.

Both exterior door mirrors and the interior mirror feature an auto dimming function. The interior rear view mirror contains one forward and one rearward facing light sensor. The light sensors control the auto dimming feature of the interior mirror to reduce glare from the headlights of following vehicles.

When auto-dimming of the interior mirror is required, a supply is provided by the interior mirror to both door mirrors to initiate the door mirror auto-dimming sequence.

Blind spot monitoring function alerts the driver to a vehicle located in the vehicle blind spot. A warning indicator is located in each exterior mirror towards the outer edge.

Refer to: Blind Spot Monitoring System (413-09, Description and Operation).

2	RH (right-hand) door module
3	RH door mirror
4	LH (left-hand) side door mirror
5	Interior mirror
6	Battery
7	CJB (central junction box)
8	LH door module
9	Exterior mirror control switches

System Operation

The rear view mirrors comprise an interior mirror mounted to the windshield, and an exterior mirror mounted on each front door cheater. The types of mirrors and associated operating functions installed depend on the specification and trim level of the vehicle.

Interior Mirrors

The interior rear view mirror is provided as a manual dimming or an electrically operated automatic dimming type.

The manual dimming mirror comprises a prismatic glass housed within a surrounding case that is attached with a ball joint connector to the mirror stem. Manual dimming of the mirror is achieved using the lever mounted on the underside of the mirror body. Operating the lever will tilt the mirror head from the 'day' position to the 'night' position.

The automatic dimming mirror comprises an electro-chromatic glass housed within a surrounding case that is attached with a ball joint connector to the mirror stem. The mirror stem incorporates an 8-pin electrical connector that is connected to the roof panel wiring harness. The wiring harness provides hardwired and a [LIN](#) connection to the [CJB](#).

Light sensors are mounted on the front and rear of the mirror surround case. The sensors control the automatic dimming feature to reduce glare from the headlights of following vehicles.

The automatic dimming function is permanently active when the ignition is in power mode 4 (Accessory) and power mode 6 (Ignition). The forward facing light sensor monitors the ambient light level at the front of the vehicle; the rearward facing light sensor monitors the light level coming from the rear of the vehicle. When light from the rear of the vehicle exceeds the ambient light level from the front of the vehicle, the automatic dimming circuit darkens the interior mirror surface.

Automatic dimming is inhibited when reverse gear is selected to provide the driver with maximum vision. On vehicles with automatic transmission, the reverse gear signal is provided by the [TCM \(transmission control module\)](#) via the high speed [CAN](#) bus to the [CJB](#). The [CJB](#) then provides a power feed to the mirror. On vehicles with manual transmission, the reverse gear signal is provided by a transmission switch that is hardwired to the [CJB](#).

Exterior Mirrors

Electrically operated and heated exterior mirrors are installed as standard. Depending on the specification and trim level of the vehicle, the following options are available:

- Power fold (switch pack operated feature) and auto fold (remote handset operated feature)
- Memory recall
- Reverse gear mirror dip
- Mirror heating
- Exterior mirror lamps.

The power fold/auto fold feature is available only when power fold mirrors are installed to the vehicle.

The mirrors can be configured to automatically fold when the vehicle is locked and unfold when unlocked. This feature can be enabled or disabled via the Vehicle settings area of the touch screen:

- Select 'Vehicle' from the touch screen Home menu.
- The Security menu is displayed as the default. Scroll down through the menu until the desired Mirror fold back is displayed.
- Select 'On' or 'Off' as appropriate.

The auto fold and reverse gear mirror dip functions are not customer configurable, but may be enabled or disabled by the dealer using the Jaguar approved diagnostic system. The diagnostic system enables or disables either or both functions by setting the [EEPROM \(electrically erasable programmable read only memory\)](#) contained within the instrument cluster.

The [LH](#) door mirror incorporates an ambient air temperature sensor that is hardwired to the [ECM \(engine control module\)](#). The [ECM](#) is connected to the [CJB](#) and other control modules via the high speed [CAN](#) bus. The sensor provides information to the [ECM](#) that is then transmitted on the medium speed [CAN](#) bus for use by other control modules. On vehicles installed with a high-line instrument cluster, the [CJB](#) transmits the temperature signal to the instrument cluster that provides a display of the ambient temperature to the driver.

The exterior mirror lamps are controlled by the interior lighting function.

The door mirrors are controlled using a switch pack located on the driver's door. The switch pack contains 2 non-latching mirror select switches labeled 'L' and 'R' and a 4-way directional joystick. The switch pack is connected to the driver door control module via the [LIN](#) bus. The driver and front passenger door control modules are connected via the medium speed [CAN](#) bus. A hardwired connection between each door control module and the corresponding door mirror, provides the supply and ground paths for the mirror motors.

Each exterior door mirror incorporates 2 motors to control horizontal (left/right) and vertical (up/down) adjustments.

On vehicles installed with a driver's power operated memory seat and memory exterior mirrors, a potentiometer is incorporated within each mirror motor and is used to provide information regarding the actual motor positions. The current position and memory positions of each door mirror motor are maintained and stored within the corresponding door control module.

The memory exterior mirror positions are also monitored and stored within door control module memory when the reverse gear mirror dip function is used.

When reverse gear is selected, the door control modules store the current mirror positions and will then dip both the driver and passenger mirror glass to a default dip position. While reverse gear is selected it is possible to store a preferred dipped mirror position by adjusting the driver/passenger mirror glass to the desired position via the mirror switch pack. When the desired position is achieved using the switches, the new dip positions will be automatically stored by the door control modules when reverse gear is de-selected. Therefore when reverse gear is re-selected, the dip position recalled by the door control modules will be the new reverse gear mirror dip stored position. When reverse gear is deselected the mirror glass will automatically move to the previous stored position prior to reverse gear selection.

Reverse gear mirror dip is only available when memory mirrors are installed, and reverse gear mirror dip is enabled within the instrument cluster.

If the driver selects a memory recall function using the memory seat switch pack, the driver's memory seat and exterior memory mirrors are moved to a stored memory position.

Exterior mirrors with the power fold/auto fold feature incorporate a motor located in the hinge of each exterior mirror arm. Operation of the power fold feature is achieved using the exterior mirror switch pack. Operation of the auto fold feature is achieved using the remote handset.

The power fold function is active when the ignition is in power mode 6 (Ignition).

Both exterior mirrors will power fold when the mirror switch pack 'L' and 'R' switches are pressed together. Pressing the switches again will unfold the mirrors.

When the instrument cluster is configured for the auto fold feature, the mirrors will fold in when the remote handset lock button is pressed. The mirrors will unfold when the vehicle is unlocked using the remote handset unlock button.

• **NOTE:** If the mirrors are folded in using the mirror switch pack (power fold) and the vehicle is then locked, subsequent unlocking of the vehicle will not unfold the mirrors.

When the remote handset unlock button is operated, the [CJB](#) recognizes the remote handset for that vehicle and acknowledges the request. The door control modules are connected directly to the [AJB \(auxiliary junction box\)](#) for power supply to the exterior mirror folding motors.

When the vehicle is locked the door control modules reverse the polarity of the mirror fold motor, power and ground connections to operate the mirrors in the opposite direction.

Exterior mirror heating is provided with heater elements bonded to the back of the mirror glass. Power supply for the mirror heating elements is provided by the corresponding driver or passenger door control module via the [RJB](#). The door control modules receive a power supply from the [RJB](#), and are both connected on the medium speed [CAN](#) bus to the [ATC \(automatic temperature control\)](#) module. A ground terminal from each door control module completes the circuit. The [ATC](#) module automatically controls the mirror heating function whenever the ignition is in power mode 4 (Accessory) and power mode 6 (Ignition).

Operation of the exterior mirror heaters is fully automatic and not controllable by the driver. Exterior mirror heater operation is determined by ambient air temperature and windshield wiper status. When ambient air temperature reaches a pre-determined level, the [ATC](#) module broadcasts an exterior mirror heating request to the door modules over the medium speed [CAN](#) bus. On receipt of this message, the door modules provide feed and ground connections to both exterior mirror heater elements.

The mirror heating is controlled in two phases, the initial heating phase and a second [PWM \(pulse width modulation\)](#) controlled phase. In the first phase the heater elements in the mirrors are permanently powered for a pre-determined length of time. This length of time varies with the ambient temperature. During the second [PWM](#) phase, the heater elements are turned on and off every 30 seconds. The amount of time the exterior mirror heaters are operational increases if the windshield wipers are switched on. This ensures the mirrors remain mist free in damp and wet conditions, where there is an increased risk of misting.

Rear View Mirrors - Rear View Mirrors

Diagnosis and Testing

Principles of Operation

For a detailed description of the rear view mirrors and systems, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (501-09 Rear View Mirrors)

[Rear View Mirrors](#) (Description and Operation),
[Rear View Mirrors](#) (Description and Operation),
[Rear View Mirrors](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Exterior rear view mirror glass 	<ul style="list-style-type: none"> ● Fuse(s) ● Relay(s) ● Wiring Harness ● Electrical connector(s)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

• NOTE: When carrying out repair/diagnosis of the system, on removal of the front or rear bumper inspect the sensor connectors to ensure they were correctly latched and check fly leads for signs of chaffing or trapped wires.

Seating - Seats - Overview

Description and Operation

OVERVIEW

A number of front seating options are available. An 8-way electrically adjustable driver's seat is complemented by an 8-way electrically adjustable passenger seat. A 10-way electrically adjustable driver's seat is complemented by an 10-way electrically adjustable front passenger seat. A 16-way electrically adjustable driver's seat is complemented by a 12-way electrically adjustable front passenger seat.

On non-memory seats, the operation of the seats is controlled directly from the driver's seat switchpack. On memory seats, the operation of the seat motors is controlled by a seat control module which is located on the underside of the driver's seat frame.

The driver's seat is fitted with a seat position sensor which is located on the seat rail. The sensor is used by the [RCM \(restraints control module\)](#) to determine the seat position and adjust the inflation time of the airbag deployment accordingly.

Refer to: [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) (501-20B Supplemental Restraint System, Description and Operation).

System Operation

HEATED SEATS - OPERATION

Heated Front Seats

The TSD receives a fused power supply from the [RJB](#). One of the 3 seat heat temperature selections made by the driver or passenger using the TSD soft keys are passed from the TSD on the MOST ring to the Information and Entertainment module. The information and entertainment module processes the information and transmits the request on the medium speed [CAN](#) bus to the [ATC](#) module.

The cushion heaters have a thermal sensor which supplies a feed back signal back to the [CJB](#). The squab heater elements do not have a thermal sensor and are maintained at the same temperature as the seat cushion elements.

The [ATC](#) module reacts to the driver request information received from the information and entertainment module and requests the [CJB](#) to activate the seat heaters. The [CJB](#) measures the returned temperature signals from the thermal sensors and relays the temperature signals back to the [ATC](#) module. The [ATC](#) module then uses the measured seat element temperatures to provide closed-loop control of the heater elements to maintain the temperature at one the 3 heat ranges selected.

- **NOTE:** To prevent excessive battery discharge, the heated front seats will only operate when the engine is running.

Heated and Cooled Front Seats

The TSD receives a fused power supply from the [RJB](#). Selections made by the driver using the TSD soft keys are passed from the TSD on the MOST ring to the Information and Entertainment module. The information and entertainment module processes the information and transmits the request on the medium speed [CAN](#) bus to the front seat climate control module. The front seat climate control module is located beneath the **RH (right-hand)** front seat, on the floor cross member.

The front seat climate control module receives its power supplies from the [CJB](#). Heating and cooling requests are generated using the soft buttons on the TSD. These requests are transmitted to the information and entertainment module over the MOST ring. The Information and Entertainment module forwards these requests to the front seat climate control module over the medium speed [CAN](#) bus.

The front seat climate control module supplies power to the two climate modules in each seat. The temperature sensor in each climate module is monitored by the front seat climate control module which uses the temperature information to control the Peltier cells accordingly and also the blower fans to distribute the heated or cooled air.

- **NOTE:** To prevent excessive battery discharge, the heated and cooled front seats will only operate when the engine is running.

Electric Driver's Seat Adjustment - Non-Memory Seats

The [CJB](#) supplies 3 power supplies to the driver's seat switchpack. The fused supplies provide power for the seat height and squab recline, the seat slide and seat tilt and the lumbar adjustment respectively. The [CJB](#) only provides the power to the driver's seat switch pack when the ignition is on (power mode 6).

For the seat movement motors, when the applicable switch is operated, the power is supplied to the applicable side of the motor and the ground path is completed to operate the motor in the required direction. To move the motor in the opposite direction the polarity is reversed.

For the lumbar adjustment, when the switch is operated in the inflate position, power is supplied to the pump motor to inflate the lumbar support. When the switch is operated in the opposite direction, the power energizes a solenoid which in turn opens a valve to deflate the lumbar support.

Electric Passenger Seat Adjustment (8, 10 and 12 way)

The [CJB](#) supplies 3 power supplies to the passenger seat switchpack. The fused supplies provide power for the seat height and squab recline, the seat slide and seat tilt and the head restraint and lumbar adjustment respectively. The [CJB](#) only provides the power to the passenger seat switch pack when the ignition is on (power mode 6).

For the seat movement and head restraint motors, when the applicable switch is operated, the power is supplied to the applicable side of the motor and the ground path is completed to operate the motor in the required direction. To move the motor in the opposite direction the polarity is reversed.

For the lumbar adjustment, when the switch is operated in the inflate position, power is supplied to the pump motor to inflate the lumbar support. When the switch is operated in the opposite direction, the power energizes a solenoid which in turn opens a valve to deflate the lumbar support.

Electric Driver's Seat Adjustment - Memory Seats (10 and 16 way)

The [CJB](#) supplies 3 power supplies to the driver's seat module and one supply to the driver's seat switch pack. The fused supplies provide power for the movement motors in addition to the driver's seat switch pack. Power is only supplied to the driver's seat module and the driver's seat switch pack when the ignition is on (power mode 6).

The driver's seat switch pack is connected to the driver's seat module by a [LIN](#) bus for the seat movement switches. Any selection for seat movement generates a message which is passed via the [LIN](#) to the driver's seat module. The seat module processes the request and operates the applicable seat function as required using the power supplies from the [CJB](#).

Each seat motor contains a Hall position sensor. The sensor sends a feedback signal to the driver's seat module. The signal is used for memory store and memory recall functions.

The lumbar adjustment switch on the driver's seat switch pack is wired direct to the lumbar pump and solenoids. The switch, when moved to the inflate position for either the upper or lower inflatable cushion cell, provides a power supply to the lumbar pump and simultaneously activates the applicable inflate solenoid valve. When the switch is released the pump

stops and the solenoid valve closes trapping the air in the inflatable cushion. When the switch is moved to the deflate position for either the upper or lower inflatable cushion cell, power is supplied to the applicable deflate solenoid valve which opens to allow the air in the cushion to escape. When the switch is released, the valve is closed and the remaining air in the cushion is retained.

Component Description

FRONT SEATS - DESCRIPTION

The table below highlights the features available for each seating option.

Seat Type	Non-Heated	Heated	Heated and Cooled	Lumbar Support	Memory
8-way	Yes	Optional	No	2-way	No
10-way	Yes	Optional	Optional	2-way	Optional (Driver's seat only)
12-way	No	No	Yes	4-way	No
16-way	No	No	Yes	4-way	Yes (Driver's seat only)

Seat Heating

The 3-stage heated front seats feature 2 heater elements located in the seat cushion and a single heater element located in the seat squab. Operation of the heated front seats is controlled by the [ATC](#) module via the TSD, information and entertainment control module and the [CJB](#) module on vehicles with heated seats. On vehicles with heated and cooled seats the operation is controlled by the TSD, information and entertainment control module and the front seat climate control module.

The heated and cooled front seats each contain 2 climate modules; one in the cushion, one in the squab. The climate modules contain 'Peltier' cells which are able to deliver heating and cooling based on a voltage provided by the front seat climate control module. Each climate module also contains a fan, which blows air over the Peltier cells to distribute heated or cooled air via liners in the seat cushion and squab. The fan is also controlled by the front seat climate control module. The TSD allows the driver and passenger to select 3 ranges of heated or cooled ventilation; off, minimum and intermediate. Also, using the selections on the TSD, the driver and passenger can select between full seat ventilation or squab backrest ventilation only.

Vehicles fitted with the 3-stage heated front seat option also feature a heated steering wheel. Refer to: [Steering Column Switches](#) (211-05 Steering Column Switches, Description and Operation).

Electric Seat Adjustment

Lumbar Support

On 8, 10 and 12 way seats, a 2 way lumbar support is provided which allows the lumbar inflatable cushion to be inflated or deflated as required. On 16 way seats, a 4 way lumbar support is fitted which comprises two separate cushion cells. The upper and lower cells can be inflated or deflated individually allowing greater comfort adjustment for the driver and passenger.

The lumbar support comprises an inflatable cushion located in the seat squab, a pump and solenoids. The pump is activated when the applicable seat switch is moved to the inflate position, inflating the cell(s) in the inflatable cushion. On 8 and 10 way seats, a single solenoid operated valve allows the inflatable cushion to be deflated. On 12 and 16 way seats, 4 solenoid valves control the inflation and deflation of the upper and lower inflatable cushion cells, allowing each cell to be adjusted individually.

Seat Motors

The head restraint motor is located in the upper section of each seat squab and is accessible by removal of the seat back. The motor moves a cradle which is driven in a vertical motion by a rack and pinion arrangement. The cradle has the two head restraint stems attached to it and therefore raises and lowers the head restraint as the motor moves the cradle. The motor contains a Hall sensor which supplies positional information to the driver's seat module.

The seat slide motor is an integral component of the seat frame. The motor drives on a gear on a worm drive lead screw which is integral with the floor rail. The lead screw has a stop at each end to limit the fore and aft seat movement.

The tilt motor is located below the seat. The tilt motor drives a gear on a lead screw to raise the front of the seat cushion. The motor contains a Hall sensor which supplies positional information to the driver's seat module.

The cushion extend motor is located below the seat. The motor drives a gear on a lead screw which extends or retracts the front of the seat cushion. The motor contains a Hall sensor which supplies positional information to the driver's seat module.

The height motor is located below the seat. The height motor drives a gear on a lead screw. The lead screw moves a lever mechanism which raises or lowers the seat cushion. The motor contains a Hall sensor which supplies positional information to the driver's seat module.

The squab recline motor is located in the seat back rest. The recline motor rotates a shaft which is connected the seat squab frame and raises or lowers the back rest position. The motor contains a Hall sensor which supplies positional information to the driver's seat module.

DRIVER'S SEAT MODULE

A memory store switch is located in the lower part of the driver's door. The switch communicates with the driver's seat module via the [LIN](#) bus in the driver's seat switch pack. The memory store switch has two buttons; 1 and 2 to allow two separate memory positions to be stored and 'set' button with integral [LED \(light emitting diode\)](#). The seat, door mirror and steering column motors have position sensors which provide feedback to driver's seat module.

Once the driver's seat, steering column and exterior mirrors have been adjusted, the vehicle is able to memorize these settings for future use by using the following procedure:

- Push the memory 'SET' button, the [LED](#) in the switch will illuminate
- Press the memory button 1 or 2 to memorize the current settings. The [LED](#) will extinguish, and a chime will sound to confirm that the settings have been memorized. If the ignition is on, power mode 6, the message center will display a confirmation message.

The positions can be recalled by pressing the applicable button 1 or 2.

Stall Detection

Seat, steering column and mirror motors are deemed to have stalled if there is no change in the inputs that are received from the corresponding feedback sensors for 200 ms (seat).

If a stall condition is detected then the drive to that motor is cancelled for the remainder of that memory operation (memory recall) or until the switch is re-selected (manual movement).

If the motor movement has stopped due to loss of sensor feedback, either stall or sensor failure, then that motor may be activated again, to move past the stall position, by re-selecting the appropriate switch and pressing for longer than 2 seconds. This allows control of the motor to be maintained if sensor feedback is lost.

Upon re-selection of movement, if sensor pulses are detected then the motor will continue to be driven until the switch is released or another stall condition is detected. If sensor feedback is not detected then the motor is only driven for 0.5 second and then stops until the switch is released and then pressed again, when a further 0.5 second of activation is permitted, and so on, this is known as inch mode.

For all seat motor manual movements, whenever a motor is driven and a stall occurs, the memory control module records the position at which the stall occurred. If movement occurs beyond a stall position, then that position is erased from the control modules memory. This will always allow movement past a previously recorded stall position once movement has been registered beyond that position. This is the case for both manual and memory movement.

Initialization

When a replacement driver's seat module is fitted, it should be calibrated a Jaguar approved diagnostic system so that the module can learn the seats absolute position.

Battery Monitor

If the battery voltage drops below 10.5 Volts, then the driver's seat module ignores all requests for a memory recall until the battery voltage has reached 11.5 Volts. This will conserve as much power in the vehicle battery as possible to enable engine cranking.

REAR SEATS - DESCRIPTION

The rear seat features a single piece cushion and a 60/40 split squab. Two latches are secured to the rear bulkhead by a pair of M8 bolts to retain the seat squabs in the upright position. The latches can be released to fold down the individual cushions by pulling a cable release located below the rear window parcel shelf in the luggage compartment.

ISOFIX fastening points are attached to the vehicle floor to provide secure fastening for compatible child seats.

A centrally mounted center arm rest can be folded down from the 60% squab. The arm rest contains two drinks holders.

Seating - Seats

Diagnosis and Testing

Principle of Operation

For a detailed description of the seats and seat operation, refer to the relevant Description and Operation section in the workshop manual. REFER to: (501-10 Seating)

[Seats](#) (Description and Operation),
[Seats](#) (Description and Operation),
[Seats](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** Prior to carrying out any diagnosis, ensure the vehicle battery is in a good serviceable condition, refer to the battery care manual.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Security, condition and correct installation of seat components and fixings 	<ul style="list-style-type: none"> ● Fuses ● Harnesses for damage/corrosion ● Electrical connectors ● Damaged/corroded pins

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the concern and refer to the Symptom Chart, alternatively, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Cause	Action
No seat movement from switch pack (including no memory recall)	<ul style="list-style-type: none"> ● Seat module has gone into sleep mode ● Seat switch pack LIN, power or ground circuit - open circuit ● Seat switch pack LIN circuit - short to power, ground 	Set ignition ON. Re-check seat function from switch pack. Check for DTC B1A9887 and refer to DTC Index. Check for DTC B1A9888 and refer to DTC Index
No seat movement or lumbar movement from switch pack (including no memory recall)	<ul style="list-style-type: none"> ● NOTE: Seat module does not control the seat lumbar function ● Seat switch pack power or ground supply circuits - open circuit 	Refer to the electrical circuit diagrams and check seat switch pack power and ground supply circuits for open circuit
Seat movement and lumbar movement from switch pack is ok, however, no recall from memory switch pack	<ul style="list-style-type: none"> ● Seat switch pack to memory switch pack circuits - short, open circuit 	<ul style="list-style-type: none"> ● NOTE: Memory switch pack is separate switch hardwired to seat adjust switch Refer to the electrical circuit diagrams and check seat switch pack to memory switch pack circuits for short, open circuit
Seat movement and memory recall works correctly however seat lumbar is not working correctly	<ul style="list-style-type: none"> ● NOTE: Seat module does not control the seat lumbar function ● Seat movement switch to lumbar circuits - short, open circuit 	Refer to the electrical circuit diagrams and check seat movement switch to lumbar circuits for short, open circuit

Symptom	Possible Cause	Action
Seat movement from switch pack occurs in delayed inch mode (seat axis moves short distance when switch pressed for longer than 2 seconds and then stops). This behaviour could occur on any seat axis (slide, height, squab, tilt, headrest or cushion) when requested	<ul style="list-style-type: none"> Motor Hall sensor on affected axis is not connected or not receiving expected signals 	Check for DTCs, B1B8731, B1B9131, B1B8931, B1B9331, B106331, B106431. If present then check Hall sensor feedback circuits between seat motor and seat module and also check Hall sensor ground circuits for affected axis. These DTCs are only logged if the axis is attempted to be moved in both directions. When hall sensor connection issue fixed press switch on affected axis for longer than 2 seconds. By keeping the switch pressed the axis movement should now operate for the duration of switch-press. Re-calibrate affected seat
Seat movement from switch pack occurs in inch mode. When seat axis movement is requested from the seat switch pack the requested seat axis moves a short distance then stops (does not include lumbar). This behaviour will occur on ALL seat axis (slide, height, squab, tilt headrest and cushion) when requested. MS CAN communication not possible	<ul style="list-style-type: none"> MS CAN fault 	Carry out CAN network integrity test using manufacturer approved diagnostic system
Seat movement from switch pack occurs in inch mode. When seat axis movement is requested from the seat switch pack the requested seat axis moves a short distance then stops (does not include lumbar). This behaviour will occur on ALL seat axis (slide, height, squab, tilt headrest and cushion) when requested. MS CAN communication not possible	<ul style="list-style-type: none"> Seat module is disconnected from the CAN Bus 	Check for Instrument Cluster DTC U020800 'Lost Communication With Seat Module'. If this DTC is present, refer to the electrical circuit diagrams and check seat module power and ground supplies for short, open circuit. Carry out CAN network integrity tests using the manufacturer approved diagnostic system
Seat movement from switch pack occurs in inch mode. When seat axis movement is requested from the seat switch pack the requested seat axis moves a short distance then stops (does not include lumbar). DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

- NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.
- NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).
- NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
- NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.
- NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

PINPOINT TESTS			
		<ul style="list-style-type: none"> Right seat cushion thermal electric device fan movement restricted 	
PINPOINT TEST A : FRONT SEAT FOLD/UP MOVEMENT NOT FUNCTIONING			

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS				
A1: CHECK FOR FRONT SEAT FORWARD-REARWARD SEAT MOTOR OPERATION					
	 WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.				
	<ol style="list-style-type: none"> Set ignition status to 'ON'. From the switch pack, operate the front seat forward-rearward seat motor switch and listen for evidence of the motor operating. 				
	Does the motor operate? Yes GO to A2. No GO to A3.				
A2: CHECK FRONT SEAT FORWARD-REARWARD SEAT MOTOR DRIVE BAR					
	<ol style="list-style-type: none"> Check front seat drive bar for correct installation and condition 				
	Is the front seat drive bar correctly installed and in a serviceable condition? Yes Re-check for correct front seat forward-rearward movement. Remove seat to allow for further investigation if required. No Correctly install front seat forward-rearward seat motor drive bar, or replace if required.				
A3: CHECK FRONT SEAT FORWARD-REARWARD SEAT MOTOR					
	 WARNING: When carrying out the following steps, stand clear of all moving parts and ensure link harness is routed accordingly.				
	<ol style="list-style-type: none"> Set ignition status to 'OFF'. Disconnect front seat forward-rearward seat motor connector. 				
	<ul style="list-style-type: none"> NOTE: It may be that the seat has been driven to the limit of travel along the relevant axis, and when the link harness is connected, the seat will remain in the same position. If this is the case, a jolt may be felt from the motor. To confirm the motor operation, swap the link harness to alternate motor pin connections and the seat should travel in the opposite direction. 				
	<ol style="list-style-type: none"> Using a locally made fused link harness and power supply, connect power and ground to forward-rearward seat motor. <table border="1" data-bbox="293 1003 1471 1059"> <thead> <tr> <th>Battery positive terminal</th> <th>Battery negative terminal</th> </tr> </thead> <tbody> <tr> <td>forward-rearward seat motor pin 1</td> <td>forward-rearward seat motor pin 2</td> </tr> </tbody> </table>	Battery positive terminal	Battery negative terminal	forward-rearward seat motor pin 1	forward-rearward seat motor pin 2
Battery positive terminal	Battery negative terminal				
forward-rearward seat motor pin 1	forward-rearward seat motor pin 2				
	Does the motor operate? Yes Using manufacturer approved diagnostic system, check for related Diagnostic Trouble Codes (DTCs) and carry out the repair operations specified. Alternatively, refer to the electrical circuit diagrams and check front seat forward-rearward seat motor circuits. No Replace front seat forward-rearward seat motor. Refer to relevant section of workshop manual.				
PINPOINT TEST B : FRONT SEAT EXCESSIVE FORWARD-REARWARD FREE PLAY					
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS				
B1: CHECK FRONT SEAT FOR EXCESSIVE FORWARD-REARWARD FREE PLAY					
	 WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.				
	<ol style="list-style-type: none"> Check all accessible front seat frame fixings are installed and to the correct torque. 				
	Are all accessible front seat frame fixings installed and to the correct torque? Yes GO to B2. No Install and tighten all accessible front seat frame fixings to correct torque and re-check for excessive free play.				
B2: COMPARE THE FRONT SEAT FORWARD-REARWARD FREE PLAY AGAINST A SIMILAR SEAT					
	<ol style="list-style-type: none"> Compare the front seat forward-rearward free play against a similar seat. 				
	Is the front seat forward-rearward free play excessive when compared to a similar seat? Yes GO to B3. No The front seat frame is operating correctly. Submit Electronic Product Quality Report (EPQR) with any further query.				
B3: CHECK REMAINING FRONT SEAT FRAME FIXINGS					
	<ol style="list-style-type: none"> Remove front seat and/or any seat covers/trim to allow access to check remaining front seat frame fixings are all installed and to the correct torque. 				
	Are all remaining front seat frame fixings installed and to the correct torque? Yes Replace front seat frame. Refer to the relevant section of the workshop manual. No Install and tighten all remaining front seat frame fixings to correct torque and re-check for excessive free play.				
PINPOINT TEST C : FRONT SEAT FORWARD-REARWARD MOVEMENT NOISY					

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: COMPARE FRONT SEAT FORWARD-REARWARD MOVEMENT NOISE TO OTHER FRONT SEAT	
	 WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.
	<ol style="list-style-type: none"> Compare the front seat forward-rearward movement noise to other front seat.
	Is the front seat forward-rearward movement noise excessive when compared to other front seat? Yes GO to C2. No GO to C3.
C2: COMPARE FRONT SEAT FORWARD-REARWARD MOVEMENT NOISE TO FRONT SEAT IN OTHER VEHICLE	
	<ol style="list-style-type: none"> Compare the front seat forward-rearward movement noise to front seat in other vehicle.
	Is the front seat forward-rearward movement noise excessive when compared to front seat in other vehicle? Yes GO to C3. No The front seat frame is operating correctly. Submit Electronic Product Quality Report (EPQR) with any further query.
C3: CHECK FOR DEBRIS OBSTRUCTING SEAT MOVEMENT	
	<ol style="list-style-type: none"> Check for debris obstructing seat movement.
	Is the front seat forward-rearward movement obstructed by debris? Yes Remove obstruction and re-check for noisy forward-rearward seat movement. No GO to C4.
C4: RE-ALIGN FRONT SEAT FRAME	
	<ol style="list-style-type: none"> Loosen front seat frame fixings. Set ignition status to 'ON'. Using the front seat switch pack drive the front seat fully forward then fully rearward. Tighten front seat frame fixings to the correct torque. Re-check for noisy seat movement.
	Is the front seat forward-rearward movement still noisy? Yes GO to C5. No The front seat frame is now operating correctly.
C5: CHECK FRONT SEAT FORWARD-REARWARD SEAT MOTOR DRIVE BAR	
	<ol style="list-style-type: none"> Check front seat drive bar for correct installation and condition.
	Is the front seat drive bar correctly installed and in a serviceable condition? Yes Replace front seat forward-rearward seat motor. Refer to relevant section of workshop manual. No Correctly install front seat forward-rearward seat motor drive bar, or replace if required.

PINPOINT TEST D : FRONT SEAT HEIGHT, TILT AND/OR SEAT EXTENSION MOTOR MOVEMENT NOT FUNCTIONING

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS				
D1: CHECK FRONT SEAT HEIGHT, TILT OR EXTENSION MOTOR					
<ul style="list-style-type: none"> WARNINGS: 					
 Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.					
 When carrying out the following steps, stand clear of all moving parts and ensure link harness is routed accordingly.					
	<ol style="list-style-type: none"> Set ignition status to 'OFF'. Disconnect front seat height, tilt or extension motor connector. 				
	<ul style="list-style-type: none"> NOTE: It may be that the seat has been driven to the limit of travel along the relevant axis, and when the link harness is connected, the seat will remain in the same position. If this is the case, a jolt may be felt from the motor. To confirm the motor operation, swap the link harness to alternate motor pin connections and the seat should travel in the opposite direction. 				
	<ol style="list-style-type: none"> Using a locally made fused link harness and power supply, connect power and ground to relevant motor. 				
	<table border="1"> <thead> <tr> <th>Battery positive terminal</th> <th>Battery negative terminal</th> </tr> </thead> <tbody> <tr> <td>motor pin 1</td> <td>motor pin 2</td> </tr> </tbody> </table>	Battery positive terminal	Battery negative terminal	motor pin 1	motor pin 2
Battery positive terminal	Battery negative terminal				
motor pin 1	motor pin 2				
	Does the motor operate? Yes Using manufacturer approved diagnostic system, check for related Diagnostic Trouble Codes (DTCs) and carry out the repair operations specified. Alternatively, refer to the electrical circuit diagrams and check relevant motor circuits. No Replace the relevant motor. Refer to relevant section of workshop manual.				

PINPOINT TEST E : FRONT SEAT HEIGHT, TILT AND/OR EXTENSION MOVEMENT NOISY	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: COMPARE THE HEIGHT, TILT OR EXTENSION MOVEMENT NOISE WITH THE OTHER FRONT SEAT	
	 WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.
	1 Compare the front seat movement noise to other front seat.
	Is the front seat height, tilt or extension movement noise excessive when compared to other front seat? Yes GO to E2. No GO to E3.
E2: COMPARE FRONT SEAT HEIGHT, TILT OR EXTENSION MOVEMENT NOISE TO FRONT SEAT IN OTHER VEHICLE	
	1 Compare the front seat height, tilt or extension movement noise to front seat in other vehicle.
	Is the front seat height, tilt or extension movement noise excessive when compared to front seat in other vehicle? Yes GO to E3. No The front seat frame is operating correctly. Submit Electronic Product Quality Report (EPQR) with any further query.
E3: CHECK FOR DEBRIS OBSTRUCTING SEAT MOVEMENT	
	1 Check for debris obstructing seat movement.
	Is the front seat height, tilt or extension movement obstructed by debris? Yes Remove obstruction and re-check for noisy height, tilt or extension seat movement. If still noisy GO to Pinpoint Test ??. No GO to E4.
E4: CHECK FOR HEIGHT, TILT OR EXTENSION MOVEMENT MECHANISM LUBRICATION	
	1 Check and apply manufacturer approved lubrication to seat height, tilt or extension movement mechanism and re-test for noise.
	Is the front seat height, tilt or extension noise still apparent? Yes Replace the relevant motor. Refer to relevant section of workshop manual. No The front seat height, tilt or extension motor is operating correctly.
PINPOINT TEST F : HEATER AND COOLING - INOPERATIVE	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: CHECK FOR STORED DTC	
	1 Check the Climate Controlled Seat Module for stored DTC's.
	Are there any stored DTC's? Yes For information on stored DTC's refer to the information in the Climate Controlled Seat Module DTC index. No GO to F2.
F2: DRIVER OR FRONT PASSENGER SEAT BACKREST CLIMATE ASSEMBLY - FUNCTIONALITY CHECK	
	 WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.
	<ul style="list-style-type: none"> • NOTE: The Climate Controlled Seat's (heat and cool) function will only operate when the vehicle's engine is running. • NOTE: If a fault is identified and repaired, check for correct operation of the driver and front-passenger climate controlled seat (heat and cool) functions.
	1 Check the heat and cool function of the backrest.
	Does the backrest heat and cool function operate correctly? Yes GO to F3. No GO to F5.
F3: DRIVER OR FRONT PASSENGER SEAT CUSHION CLIMATE ASSEMBLY - FUNCTIONALITY CHECK	
	1 Check the heat and cool function at the cushion.
	Does the cushion heat and cool function operate correctly? Yes If there are no faults evident, verify the customer concern. No GO to F4.
F4: CUSHION BELLOWS	
	1 Check the condition of the bellows.
	Are the bellows obstructed, have they collapsed? Yes Remove the obstruction or replace collapsed bellows. No Suspect an internal fault with the Seat Climate Assembly. Replace as required, refer to the Warranty Policy and Procedures manual (section B1.2). Prior to installing a new component.
F5: BACKREST BELLOWS DUCT	

	1 Check the security of the bellows duct.
	Is the bellows duct correctly installed? Yes GO to F6. No Securely reconnect the bellows duct.

F6: BACKREST BELLOWS

	1 Check the security of the bellows.
	Are the bellows obstructed, have they collapsed? Yes Remove the obstruction or replace collapsed bellows. No Suspect an internal fault with the Seat Climate Assembly. Replace as required, refer to the Warranty Policy and Procedures manual (section B1.2). Prior to installing a new component. Follow the link below to check operation of the Driver or Front Passenger Seat Cushion Climate Assembly. GO to F2.

PINPOINT TEST G : HEATING AND COOLING - NOISY OPERATION

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

G1: CHECK FOR STORED DTC

	1 Check the Climate Controlled Seat Module for stored DTC's.
	Are there any stored DTC's? Yes For information on stored DTC's refer to the information in the Climate Controlled Seat Module DTC index. No GO to G2.

G2: DRIVER OR FRONT PASSENGER SEAT BACKREST CLIMATE ASSEMBLY - NOISE

 WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.	
<ul style="list-style-type: none"> • NOTE: The Climate Controlled Seat's (heat and cool) function will only operate when the vehicle's engine is running. • NOTE: If a fault is identified and repaired, check for correct operation of the driver and front-passenger climate controlled seat (heat and cool) functions. 	

	1 There is a known issue which effects a limited number of vehicles where under acceleration of the vehicle the occupant of seat can deform the suspension mat (snake wire) which then presses on the casing of the seat backrest climate assembly, this causes the casing to distort and the noise issue to occur. If contact has occurred there will be a witness mark on the casing. Carry out visual inspection of the seat backrest climate assembly that has been identified as noisy by the customer.
	Is there a witness mark on the casing? Yes Contact the local in market support for further information. No GO to G3.

G3: DRIVER OR FRONT PASSENGER SEAT CLIMATE ASSEMBLY - NOISE 2

	1 Operate the heat and cool function of the seat. Listen for a 'WAH WAH' noise (the fan speeds up and slows down repeatedly).
	Does the fan speeds up and slow down repeatedly? Yes Confirm the latest Strategy and Calibration software is installed, using the manufacturer approved diagnostic system carry out the new Climate Controlled Seat Module application and update the Climate Controlled Seat Module software if required. If the noise is still evident after software update follow link below. GO to G4. No GO to G4.

G4: DRIVER OR FRONT PASSENGER SEAT BACKREST CLIMATE ASSEMBLY - NOISE LEVEL COMPARISON

	1 Compare the noise level of the suspect climate seat assembly to another climate seat assembly.
	Is the noise level equal between the two seats? Yes The noise level is standard and comparable to the design intent. No Suspect an internal fault with the Seat Climate Assembly. Replace as required, refer to the Warranty Policy and Procedures manual (section B1.2). Prior to installing a new component.

PINPOINT TEST H : HEATING AND COOLING - POOR HEAT OR COOL EFFICIENCY

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

H1: CHECK FOR STORED DTC

	1 Check the Climate Controlled Seat Module for stored DTC's.
	Are there any stored DTC's? Yes For information on stored DTC's refer to the information in the Climate Controlled Seat Module DTC index. No GO to H2.

H2: DRIVER OR FRONT PASSENGER SEAT BACKREST CLIMATE ASSEMBLY - FUNCTIONALITY CHECK

 WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.	
<ul style="list-style-type: none"> • NOTE: The Climate Controlled Seat's (heat and cool) function will only operate when the vehicle's engine is running. 	

<p>• NOTE: If a fault is identified and repaired, check for correct operation of the driver and front-passenger climate controlled seat (heat and cool) functions.</p>	
	<p>1 Check the heat and cool function of the backrest.</p>
	<p>Does the backrest heat and cool function operate correctly? Yes GO to H3. No GO to H5.</p>
H3: DRIVER OR FRONT PASSENGER SEAT CUSHION CLIMATE ASSEMBLY - FUNCTIONALITY CHECK	
	<p>1 Check the heat and cool function at the cushion.</p>
	<p>Does the cushion heat and cool function operate correctly? Yes If there are no faults evident, verify the customer concern. No GO to H4.</p>
H4: CUSHION BELLOWS	
	<p>1 Check the condition of the bellows.</p>
	<p>Are the bellows obstructed, have they collapsed? Yes Remove the obstruction or replace collapsed bellows. No GO to H7.</p>
H5: BACKREST BELLOWS DUCT	
	<p>1 Check the security of the bellows duct.</p>
	<p>Is the bellows duct correctly installed? Yes GO to H6. No Securely reconnect the bellows duct.</p>
H6: BACKREST BELLOWS	
	<p>1 Check the security of the bellows.</p>
	<p>Are the bellows obstructed, have they collapsed? Yes Remove the obstruction or replace collapsed bellows. No Suspect an internal fault with the Seat Climate Assembly. Replace as required, refer to the Warranty Policy and Procedures manual (section B1.2). Prior to installing a new component. Follow the link below to check operation of the Driver or Front Passenger Seat Cushion Climate Assembly.GO to H2.</p>
H7: DRIVER OR FRONT PASSENGER SEAT BACKREST CLIMATE ASSEMBLY - EFFICIENCY COMPARISON	
	<p>1 Compare the efficiency of the suspect climate seat assembly to another climate seat assembly.</p>
	<p>Is the efficiency equal between the two seats? Yes The efficiency is standard and comparable to the design intent. No Suspect an internal fault with the Seat Climate Assembly. Replace as required, refer to the Warranty Policy and Procedures manual (section B1.2). Prior to installing a new component.</p>

PINPOINT TEST I : HEATING AND COOLING - HEAT OR COOL OPERATION SLOW	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
I1: CHECK FOR STORED DTC	
	<p>1 Check the Climate Controlled Seat Module for stored DTC's.</p>
	<p>Are there any stored DTC's? Yes For information on stored DTC's refer to the information in the Climate Controlled Seat Module DTC index. No GO to I2.</p>
I2: DRIVER OR FRONT PASSENGER SEAT BACKREST CLIMATE ASSEMBLY - FUNCTIONALITY CHECK	
<p> WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.</p> <p>• NOTE: The Climate Controlled Seat's (heat and cool) function will only operate when the vehicle's engine is running.</p> <p>• NOTE: If a fault is identified and repaired, check for correct operation of the driver and front-passenger climate controlled seat (heat and cool) functions.</p>	
	<p>1 Check the heat and cool function of the backrest?</p>
	<p>Does the backrest heat and cool function operate correctly? Yes GO to I3. No GO to I5.</p>
I3: DRIVER OR FRONT PASSENGER SEAT CUSHION CLIMATE ASSEMBLY - FUNCTIONALITY CHECK	
	<p>1 Check the heat and cool function at the cushion.</p>
	<p>Does the cushion heat and cool function operate correctly? Yes If there are no faults evident, verify the customer concern. No GO to I4.</p>
I4: CUSHION BELLOWS	
	<p>1 Check the condition of the bellows.</p>

	Are the bellows obstructed, have they collapsed? Yes Remove the obstruction or replace collapsed bellows. No GO to I7.
I5: BACKREST BELLOWS DUCT	
	1 Check the security of the bellows duct.
	Is the bellows duct correctly installed? Yes GO to I6. No Securely reconnect the bellows duct.
I6: BACKREST BELLOWS	
	1 Check the security of the bellows.
	Are the bellows obstructed, have they collapsed? Yes Remove the obstruction or replace collapsed bellows. No Suspect an internal fault with the Seat Climate Assembly. Replace as required, refer to the Warranty Policy and Procedures manual (section B1.2). Prior to installing a new component. Follow the link below to check operation of the Driver or Front Passenger Seat Cushion Climate Assembly. GO to I2.
I7: DRIVER OR FRONT PASSENGER SEAT BACKREST CLIMATE ASSEMBLY - OPERATION COMPARISON	
	1 Compare the operation of the suspect climate seat assembly to another climate seat assembly.
	Is the operation equal between the two seats? Yes The operation is standard and comparable to the design intent. No Suspect an internal fault with the Seat Climate Assembly. Replace as required, refer to the Warranty Policy and Procedures manual (section B1.2). Prior to installing a new component.

PINPOINT TEST J : HEATING AND COOLING - INTERMITTENT OPERATION

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
J1: CHECK FOR STORED DTC	
	1 Check the Climate Controlled Seat Module for stored DTC's.
	Are there any stored DTC's? Yes For information on stored DTC's refer to the information in the Climate Controlled Seat Module DTC index. No GO to J2.
J2: CABLE CONNECTION CHECK	
 WARNING: Before work is carried out, make the air bag supplemental restraint system safe. For additional information, refer to Standard Workshop Practices section of workshop manual.	
<ul style="list-style-type: none"> • NOTE: The Climate Controlled Seat's (heat and cool) function will only operate when the vehicle's engine is running. • NOTE: If a fault is identified and repaired, check for correct operation of the driver and front-passenger climate controlled seat (heat and cool) functions. 	
	1 Identify from customer concern or stored DTC's which Seat Climate Assembly is operating intermittently and confirm the harness connector is fully connected.
	Is the harness connector is fully connected? Yes Suspect an internal fault with the Seat Climate Assembly. Replace as required, refer to the Warranty Policy and Procedures manual (section B1.2). Prior to installing a new component. No Disconnect the harness connector, inspect connector and terminals for damage. Repair or replace if required. Reconnect connector and check operation.

Seating - Front Seat

Removal and Installation

Removal

1. Make the air bag supplemental restraint system (SRS) safe. For additional information, refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).

2. NOTE: Right-hand shown, left-hand similar.

E98936

Position the front seat fully forwards.

- Lower the front seat head restraint to the fully lowered position.

3. NOTE: Right-hand shown, left-hand similar.

E98937

Remove the safety belt lower anchor trim panel.

4. NOTE: Right-hand shown, left-hand similar.

Release the safety belt lower anchor from the front seat.

5. NOTE: Left-hand shown, right-hand similar.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the 2 rear bolts from the front seat.

6. Position the front seat fully rearwards.

7. NOTE: Left-hand shown, right-hand similar.

Remove the 2 front bolts from the front seat.

8. Reposition the front seat to the central position.

9. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

10. Disconnect the front seat harness electrical connectors.

- Tilt the front seat rearwards to aid disconnecting the front seat electrical connectors.

11. NOTE: Make sure no damage is caused to the vehicle trim when removing the front seat.

- NOTE: Left-hand shown, right-hand similar.

Remove the front seat.

Installation

1. To install, reverse the removal procedure.

- TORQUE: 47 Nm

2. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

TORQUE: 47 Nm

3. NOTE: Right-hand shown, left-hand similar.

TORQUE: 40 Nm

E98938

Seating - Front Seat Backrest

Removal and Installation

Removal

1. Make the air bag supplemental restraint system (SRS) safe.
For additional information, refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).
2. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
3. Remove the front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).

4.  **WARNING:** This step requires the aid of another technician.

 **CAUTION:** Take extra care when handling the component.

Remove the front seat backrest assembly.

E101228

5. Remove the front seat backrest cover.
For additional information, refer to: [Front Seat Backrest Cover](#) (501-10 Seating, Removal and Installation).
6. Remove the backrest halo panel.
 - Release the 5 wiring harness clips.

7. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the front seat recliner motor.
For additional information, refer to: [Front Seat Recliner Motor](#) (501-10 Seating, Removal and Installation).

8. Remove the lumbar assembly.
For additional information, refer to: Lumbar Assembly (501-10, Removal and Installation).
9. Remove the front seat head restraint motor.
For additional information, refer to: Front Seat Head Restraint Motor (501-10, Removal and Installation).

Installation

1. To install, reverse the removal procedure.

- TORQUE: 35 Nm

2. If a new component has been installed, configure using Jaguar approved diagnostic equipment.

Seating - Front Seat Backrest Cover

Removal and Installation

Removal

1. Make the air bag supplemental restraint system (SRS) safe.
For additional information, refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).
2. Remove the front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
3. Remove the side air bag module.
For additional information, refer to: [Side Air Bag Module](#) (501-20B Supplemental Restraint System, Removal and Installation).

- WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least one minute after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

- NOTE: Removal steps in this procedure may contain installation details.

Glass, Frames and Mechanisms - Glass, Frames and Mechanisms - Overview

Description and Operation

Overview

The windshield is manufactured from laminated green-tinted glass with two variants of windshield being available: standard and heated.

The rear window is manufactured from toughened green-tinted glass. The heated rear window grid-wire and antennas are incorporated in the rear window. There are two variants of rear window dependant on the TV antenna specification.

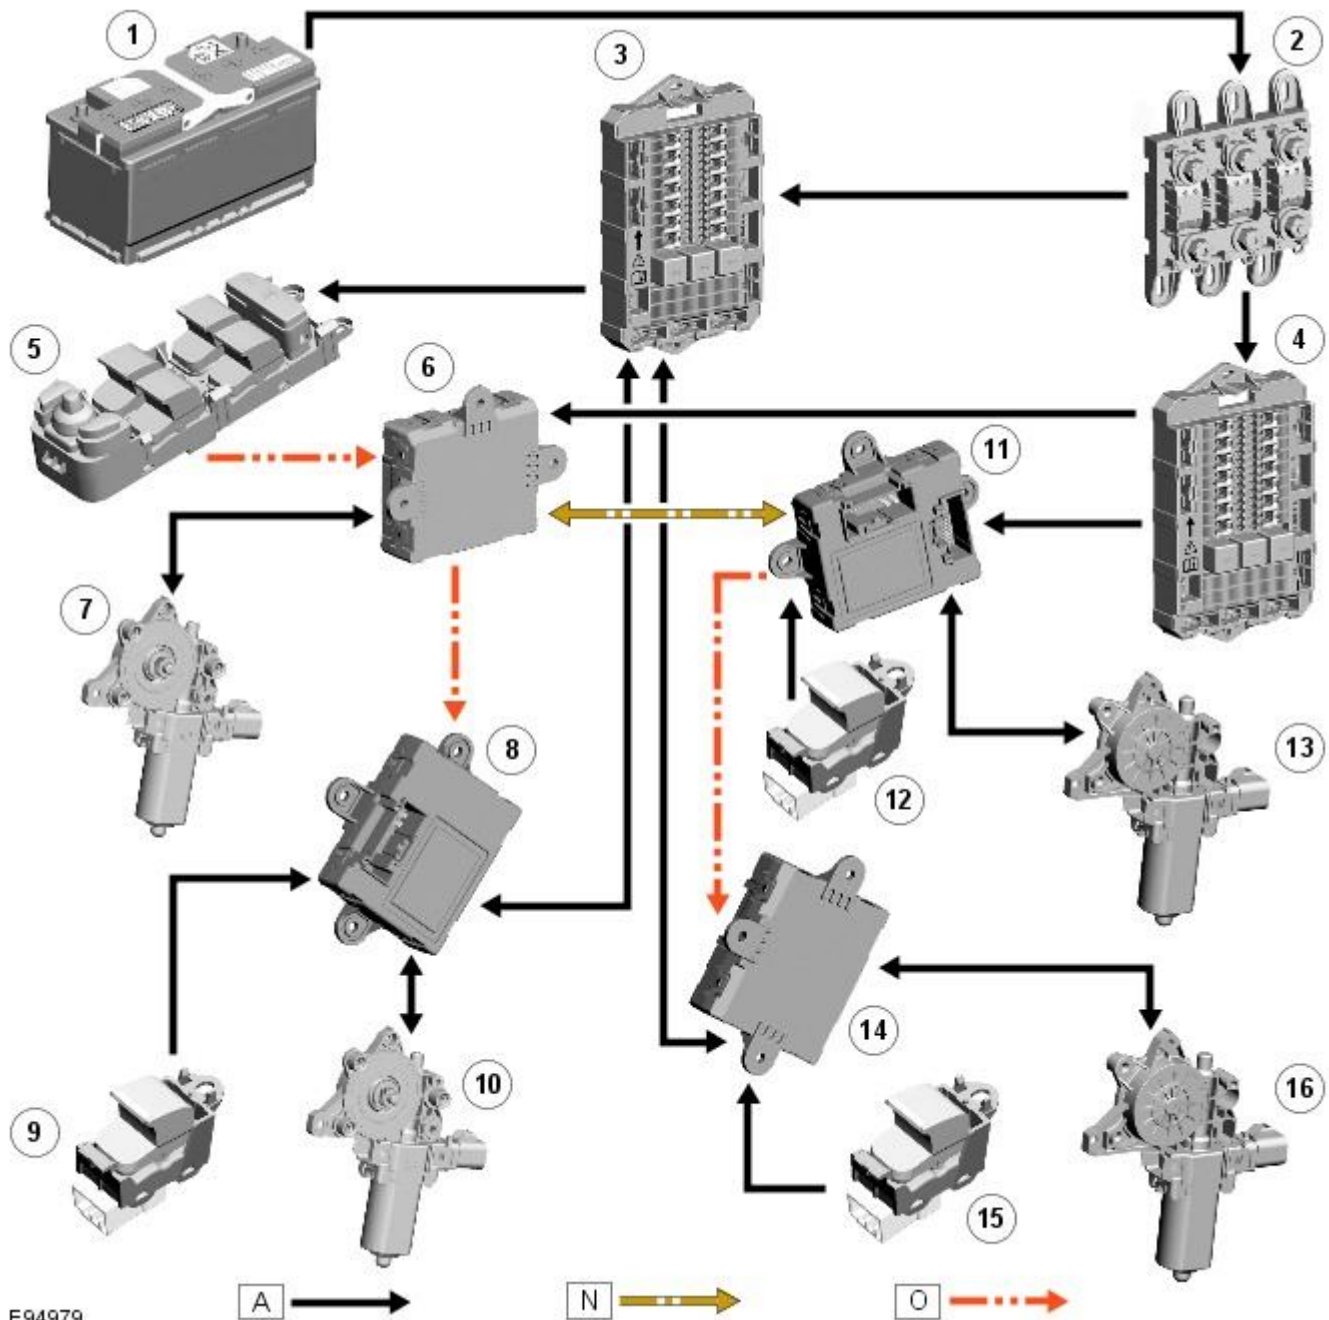

The door windows are manufactured from green-tinted toughened glass. The driver and passenger windows are electrically operated; the rear glass sections in the rear doors are fixed units. Door windows can be operated individually, or by the driver's window control switch. An anti-trap function is included that stops the window's travel when an obstacle is detected in the in the window's path.

System Operation

Door Windows

All windows can be operated individually, or by the driver's window control switch. The operation of the windows is proportional to the switch activation. The driver window can be controlled by 'one touch' in an upward or downward direction. When the 'one touch' operation is activated in the upwards direction an anti-trap sensor is automatically checked prior to the window closing. If the anti-trap sensor is inoperative the window will not close. When the anti-trap sensor detects an obstacle in the window's path, the upward travel of the window will automatically cease. Downward travel of the window will begin and then stop when a preset time has elapsed.

Electric window operation is enabled while the ignition is in power mode 4 and 6. When the switches in the driver's door are used to operate the passenger windows, the driver's door module outputs a related message on the LIN (local interconnect network) bus and medium speed CAN (controller area network) bus. The passenger door module responds to the message by operating the appropriate window. When the child lock is engaged, the rear door modules ignore inputs from the rear window switches.

End of travel shut off

End of travel shut-off for the window motors is determined by monitoring the current draw of the motors. Each time it switches on a window motor, the door module measures the window motor current for a preset time. The maximum value measured within that time is stored as the switch-on current. When the window motor current next exceeds the switch-on current, the door module assumes the window has reached the end of its travel and switches off the power supply to the window motor even if a window switch is still being activated.

Anti-trap

The anti-trap function is enabled for window closing in both the inching and one-shot modes. If the anti-trap feature is activated while a window is closing, the window motor is reversed for a preset period.

A Hall sensor, located in the window regulator motor, monitors the speed of the motor and if the speed decreases below a set threshold, indicating an obstruction, the power feed to the motor is reversed so the window goes back down for preset time.

In an emergency the anti-trap function can be overridden by holding the window switch in the one-shot closed position.

After the battery has been disconnected it is necessary to initialize the door window motors to be able to operate the one-shot up function.

Component Description

Windshield

The windshield, manufactured from 5mm laminated green-tinted glass is positioned to the vehicle's body by two locator pins, one in each top corner of the windshield. This allows for centralizing movement of the windshield across the car upon fitment. The base of the windshield carries a leaf-screen retainer. The windshield is bonded and sealed to the vehicle body aperture using Polyurethane (PU) adhesive. The windshield finisher is a three-sided extruded flip, taped onto the inner surface of the glass; this helps to centralize the glass in the aperture.

Two variants of windshield are available:

- standard, and
- heated.

Refer to: [Control Components](#) (412-01 Climate Control, Description and Operation).

Interior Mirror and Rain Sensor

The interior mirror and rain sensor mounting positions are located at the top of the windshield.
Refer to: [Wipers and Washers](#) (501-16 Wipers and Washers, Description and Operation).

Rear Window

The rear window, manufactured from toughened 4mm green-tinted glass, is positioned to the vehicle's body by two locator pins, one in each top corner of the windshield. This allows for the centralizing movement of the windshield across the car upon fitment. The window is bonded and sealed to the vehicle body aperture using PU adhesive. The window finisher is a three-sided extruded flip, taped onto the inner surface of the glass; this helps to centralize the glass in the aperture.

The heated rear window grid wire and antennas are incorporated in the rear window. There are two derivatives of rear window dependant on the TV antenna specification.

Refer to: [Video System](#) (415-01 Information and Entertainment System, Description and Operation).

Door Windows

The door windows are manufactured from 4.85mm green-tinted toughened glass. The driver and passenger windows are electrically operated, and are raised and lowered by a cable mechanism; the rear glass sections in the rear doors are fixed units.

All windows can be operated individually, or by the driver's window control switch. The operation of the windows is proportional to the switch activation. The driver window can be controlled by 'one touch' in an upward or downward direction. When the 'one touch' operation is activated in the upwards direction an anti-trap sensor is automatically checked prior to the window closing. If the anti-trap sensor is inoperative the window will not close. When the anti-trap sensor detects an obstacle in the window's path, the upward travel of the window will automatically cease. Downward travel of the window will begin and then stop when a preset time has elapsed.

Glass, Frames and Mechanisms - Glass, Frames and Mechanisms

Diagnosis and Testing

Principle of Operation

For a detailed description of the Glass, Frames and Mechanisms, refer to the relevant Description and Operation section in the workshop manual. REFER to: (501-11 Glass, Frames and Mechanisms)

[Glass, Frames and Mechanisms](#) (Description and Operation),
[Glass, Frames and Mechanisms](#) (Description and Operation),
[Glass, Frames and Mechanisms](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern by operating the system.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Window glass ● Window regulator 	<ul style="list-style-type: none"> ● Fuse(s) ● Window motor ● Loose or corroded electrical connector(s) ● Switch ● Circuit(s)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the concern is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

- NOTE: If the control module is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module.
- NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).
- NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
- NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.
- NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action
B109712	Heated Windshield Relay	<ul style="list-style-type: none"> ● Heated windshield relay control circuit - short to power 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Glass, Frames and Mechanisms - Door Window Motor Initialization

General Procedures

1. NOTE: After the battery has been disconnected it is necessary to initialize each door window motor separately to operate the "one-touch" up function.

Operate the window control switch until the door window glass is in the fully closed position, continue to operate the window control switch for a further two seconds.

2. Release the window control switch.

3. Operate the window control switch in the closed position and continue to operate the window control switch for a further two seconds.

4. Operate the window control switch until the door window glass is in the fully open position ("one-touch" down).

5. NOTE: If the door window motor initialization has been completed correctly, when the window control switch is operated, the door window glass should move to the fully closed position ("one-touch" up) automatically.

• **NOTE:** If the door window glass does not fully close automatically ("one-touch" up), repeat the complete procedure.

Operate the window control switch once to the close position.

6. Repeat the door window motor initialization for each door window motor.

Instrument Panel and Console - Instrument Panel - Overview

Description and Operation

OVERVIEW

The instrument panel incorporates a magnesium cross car beam. North American Specification (NAS) vehicles also feature a pair of energy absorbing brackets. The energy absorbing brackets are mounted behind the driver's side of the instrument panel. Each is secured to the cross car beam by 2 screws.

The cross car beam acts as a support and provides mounting points for the instrument panel top pad. The instrument panel top pad supports various other system components. These include ducting, vents and registers for the climate control system and the passenger airbag. For additional information, refer to:

Instrument Panel and Console - Instrument Panel - System Operation and Component Description

Description and Operation

System Operation

JAGUARSENSE OPERATION

JaguarSense uses a capacitive proximity sensor which operates along similar lines to a capacitor. The sensor comprises a single capacitor conductor plate. The second capacitor conductor plate is the operators hand, known as the target. The capacitor dielectric is the air gap between the sensor conductor plate and the target.

As the target approaches the proximity sensor, current flow through the conductor plate increases. Circuitry within the sensor module detects the rise in current flow and provides a signal output to the relevant control module. Both the glove box and interior lamp JaguarSense systems are controlled by the [CJB \(central junction box\)](#).

The glove box proximity sensor is also inhibited if the anti-theft alarm system is armed and if valet mode is selected using the Touch Screen Display (TSD).

Component Description

JAGUARSENSE DESCRIPTION

The conventional glove box release and overhead console lamp switches have been replaced with capacitive proximity sensors. This feature is known as 'JaguarSense'. The glove box proximity sensor takes the form of a roundel located above the inboard end of the glove box. The interior lamp assembly contains 3 capacitive proximity sensors located behind the lamp lense.

The glove box proximity sensor module also incorporates 2 anti-wipe sensors. The anti-wipe sensors are located on either side of the proximity sensor and can detect a wiping movement along the instrument panel veneer. When this movement is detected the proximity sensor is temporarily inhibited.

Handles, Locks, Latches and Entry Systems - Handles, Locks, Latches and Entry Systems - Overview

Description and Operation

The hinged panels are secured with latches and strikers. A remotely operated central locking system controls the locking and unlocking of the door and luggage compartment latches. A radio frequency Smart Key allows the vehicle to be locked and unlocked by pressing the appropriate handset buttons. Two levels of central locking system are available:

- remote central locking, and an
- optional passive entry system.

The remote central locking system, provides locking and unlocking of the vehicle from inside and outside of the vehicle. The system is operated using buttons on the Smart Key, which transmits radio frequency signals to the central locking radio frequency receiver.

On vehicles fitted with the optional passive entry system, the vehicle can be unlocked without the use of a key or pressing buttons on the Smart Key. The Smart Key operates the passive entry system.

13	Door handle, lock/unlock switch and antenna - driver door

System Operation

The hinged panels are secured with latches and strikers. A remotely operated central locking system controls the locking and unlocking of the door and luggage compartment latches. A radio frequency Smart Key allows the vehicle to be locked and unlocked by pressing the appropriate handset buttons. Two levels of central locking system are available: remote central locking and an optional passive entry system.

The passive entry and associated passive start system allows the driver to unlock and start the vehicle without using a vehicle key in a door-lock or ignition switch. The passive entry system is an optional fitment while the passive start system is a standard fitment on all vehicles. The passive start system is combined with the passive anti-theft immobilization system.

Refer to: [Anti-Theft - Passive](#) (419-01B Anti-Theft - Passive, Description and Operation).

Emergency access to the vehicle is provided by two concealed key barrels: one located in the front left-hand door handle and one located on the underside of the luggage compartment lid finisher. An emergency, removable key blade is fitted into the Smart Key.

Operation of either key barrel unlocks the vehicle but does not disarm the alarm system. The key barrels in the door and luggage compartment lid are concealed by a plastic cover which can be removed by inserting the blade of the emergency key into a slot in the cover.

Locking and unlocking conditions using the emergency key in the door key barrel:

- If the alarm is not armed the vehicle can be centrally unlocked.
- If the alarm is armed the door only can be opened and the alarm will be triggered.
- The vehicle cannot be double locked or the alarm system armed using the emergency key.

The vehicle can be centrally locked and unlocked from inside using the interior handle release levers on the front doors only. Central locking and unlocking can also be performed using lock and unlock buttons on the vehicle's fascia. The driver can select locking options, single point entry or drive away locking for example, from a menu available on the touch screen.

Central Locking – Radio Frequency Remote System

The radio frequency central locking system, provides locking and unlocking of the vehicle from inside and outside of the vehicle. The system is operated using buttons on the Smart Key, which transmits radio frequency signals to the central locking radio frequency receiver.

The system provides additional security by double-locking the doors from outside the vehicle if the lock button, on the Smart Key, is pressed twice within 3 seconds; this function is not applicable in North American Specification (NAS) and Japanese markets.

Additional buttons on the Smart Key provide for the convenience operation of the luggage compartment lid release, headlamp delay and panic alarm functions. A global open or close feature is also available in certain markets using the lock/unlock buttons.

Passive Entry

On vehicles fitted with the optional passive entry system, the vehicle can be unlocked without the use of a key blade or pressing buttons on the Smart Key. The Smart Key operates the passive entry system in addition to the passive start system.

Refer to: [Anti-Theft - Passive](#) (419-01B Anti-Theft - Passive, Description and Operation).

The passive entry system is controlled by the keyless vehicle module and five low frequency antennas. One antenna located in each door handle and one antenna located behind the rear bumper cover.

When a vehicle door handle is pulled to the first five-percent of its travel and the Smart Key is within one meter of the handle; the Smart Key receives the low-frequency signal transmitted from the keyless vehicle module. The Smart Key responds with a radio frequency transmission of its authorization code. The radio frequency signal is received by the central locking radio-frequency receiver and passed to the keyless vehicle module which checks and approves the code as valid. Once the handle is pulled to eighty percent of its travel the keyless vehicle module then drives the fast latch directly to allow the door to be opened. The keyless vehicle module also transmits an unlock request to the [CJB](#). The CJB then passes an unlock request to the door modules.

Locking of the vehicle is performed by pressing one of the buttons located on each exterior door handle, with the Smart Key within a one meter range of the vehicle. When the door handle button is pressed, the keyless vehicle module transmits a low-frequency signal via the low-frequency handle antenna to the Smart Key. The Smart Key transmits a radio frequency signal which is verified by the keyless vehicle module and allows the doors to be locked or double locked and the alarm system to be armed.

To double lock the vehicle, the button on the exterior door handle must be pressed twice within three seconds, with the Smart Key within one meter range of the vehicle.

If a door, engine-compartment lid or the luggage compartment lid is ajar when an attempt to lock the vehicle is made, an error tone is emitted and no locking action will occur.

Refer to: [Anti-Theft - Active](#) (419-01A Anti-Theft - Active, Description and Operation).

Component Description

Engine Compartment Lid Latches

Two engine-compartment lid latches are located on the front crossmember. An engine-compartment lid release lever is located below the instrument panel on the left-hand 'A' pillar and is connected with a cable to the latches. An engine-compartment lid ajar switch is integrated in the engine-compartment lid latch.

Door Latches

The door latches are located at the rear of each door and engage with a striker on the adjacent pillar. Each door latch motor assembly contains micro-switches for lock, unlock and door ajar. Motors provide for the central door locking and the double locking feature. The electrical control for the door latch components is provided by the CJB and RJB via the driver's and passenger door modules.

The interior door handles are connected by a cable to the latch release mechanisms. The interior door handles also incorporate a locking facility to allow the doors to be locked from inside the vehicle when all the doors are closed. If a door is ajar the locking feature is inhibited.

Luggage Compartment Lid Latch

The luggage compartment latch is attached to the bottom of the lid. The latch can be released electrically by pressing the interior release button located on the outboard side of driver's lower knee bolster; a release button is also provided on the Smart Key. There is also a release switch on the underside of the luggage compartment lid finisher.

On NAS vehicles an emergency release cable is attached to the latch. This allows the latch to be manually opened by pulling a handle located in the luggage compartment lid interior trim.

Fuel Filler Door

The fuel filler door is electrically locked by a motor located on the fuel door housing. The fuel door is locked when the vehicle is locked and alarmed. The fuel door can be opened when the vehicle is unlocked or locked:

- via an interior handle,
- via drive-a-way locking,
- via the lock switch on the fascia,
- via the external door key barrel.

Handles, Locks, Latches and Entry Systems - Locks, Latches and Entry Systems

Diagnosis and Testing

Description and Operation

For a detailed description of the handles, locks, latches and entry systems, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (501-14 Handles, Locks, Latches and Entry Systems)

[Handles, Locks, Latches and Entry Systems](#) (Description and Operation),
[Handles, Locks, Latches and Entry Systems](#) (Description and Operation),
[Handles, Locks, Latches and Entry Systems](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. Verify the customer concern.

• NOTE: For remote keyless entry issues, REFER to: [Remote Keyless Entry \(RKE\) Module](#) (419-10 Multifunction Electronic Modules, Diagnosis and Testing).

2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Misaligned door(s), hood or luggage compartment lid ● Door latch(s) ● Actuating rod(s) ● Exterior door handle(s) ● Interior door handle(s) ● Door lock cylinder ● Cable(s) ● Luggage compartment lid exterior release switch 	<ul style="list-style-type: none"> ● Fuse(s) ● Wiring harness ● Electrical connector(s) ● Door lock actuator(s) ● Remote transmitter batteries ● Vehicle battery ● Remote transmitter ● Door lock switch(s)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).

• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Wipers and Washers - Wipers and Washers - Overview

Description and Operation

OVERVIEW

The wipers and washers comprise a windshield wiper system with a conventional wiper linkage and 2 wiper blades and a windshield washer with jets located on the wiper arms. A headlamp powerwash is available on certain models.

The front wipers have 4 operational states:

- Flick wipe
- Auto
- Slow wipe
- Fast wipe.

Operation of the windshield wipers and washers and the headlamp powerwash is controlled by the [CJB \(central junction box\)](#) in response to driver inputs and signals from the rain/light sensor. The instrument cluster monitors the condition of the wiper/washer control switch and transmits driver requests to the [CJB](#) over the medium speed [CAN \(controller area network\)](#) bus.

The 'Auto' function requires an input from the rain sensor. The rain sensor is mounted on the inner surface of the windshield and transmits an infra-red signal to determine the amount of water on the outer surface of the windshield. A value is then transmitted to the [CJB](#) over the [LIN \(local interconnect network\)](#) bus.

Wipers and Washers - Wipers and Washers - System Operation and Component Description

Description and Operation

System Operation

WINDSHIELD WIPERS

Operation of the wipers and washers is controlled by the [CJB](#) in response to driver inputs from the wiper control switch and signals from the rain/light sensor. The instrument cluster monitors the condition of the wiper/washer control switch and transmits driver requests to the [CJB](#) over the medium speed [CAN](#) bus.

The wiper control switch is connected via hardwired connections to the instrument cluster. The instrument cluster outputs on 4 wires a reference voltage to the wash/wipe switch, the auto wiper switch, the wiper switch and the flick wipe switch. All the switches are connected to the instrument cluster on a common ground. Each switch function is connected to ground via a resistor or series of resistors and the instrument cluster monitors the ground signal and determines which function has been selected. The instrument cluster then outputs the appropriate message on the medium speed [CAN](#) bus to the [CJB](#) which responds to the requested wiper function. The [CJB](#) then activates the appropriate function either directly or via relays in the [EJB](#) for the wipers and headlamp powerwashers.

Speed Dependent Mode

When the wipers are operating, a vehicle speed signal received by the [CJB](#) on the high speed [CAN](#) bus is used to operate a speed dependent mode. If the wipers are in fast wipe and the vehicle speed decreases to below 2 km/h (1.2 mph), the wipers will reduce to the normal wipe speed. When the vehicle speed increases to above 8 km/h (5 mph) the fast wiper speed selection is restored. If slow speed is selected and the vehicle speed drops below 2km/h (1.2 mph), the wipers will operate in the intermittent mode. When the vehicle speed increases to above 8 km/h (5 mph) the slow wiper speed selection is restored – this feature is configurable by the dealer using the approved Jaguar diagnostic system.

Wiper Motor

The wiper motor is controlled by the [CJB](#). The [CJB](#) is connected to a wiper motor normal/fast relay in the [EJB](#) on 2 wires. The [CJB](#) is also connected to a wiper run/park relay, also located in the [EJB](#).

Driver requests are received by the [CJB](#) which energizes the wiper motor normal/fast relay in the appropriate mode (normal or fast wipe) and also energizes the run/park relay in the run mode by providing a ground for the relay coils. When wiper operation is deselected by the driver, the [CJB](#) monitors a park switch which is integral with the wiper motor. On receipt of a signal from the park switch, the [CJB](#) de-energises the run/park relay, removing the power supply through the normal/fast relay, stopping the wipers in the park position on the windshield.

The wiper motor is a **DC (direct current)** motor which drives a gear wheel via a worm drive attached to the motor spindle. The motor has 3 sets of brushes with one brush connected to ground. When the normal/fast relay is energized in the normal position, a power feed is supplied to the brush directly opposite the ground brush and operates the motor at slow speed. When the relay is energized in the fast position, a power feed is connected to the second motor brush, which is offset from the ground brush and operates the motor at the fast speed. With power supplied through the offset brush, the current flows through fewer motor coil windings. This results in a lower resistance to current flow to the ground brush and produces a higher motor rotational speed.

WINDSHIELD WASHERS

The windshield washers are controlled by the [CJB](#). A driver request for washer operation, via the wiper control switch, is passed to the instrument cluster on the [LIN](#) bus. The instrument cluster passes the message to the [CJB](#) on the medium speed [CAN](#) bus.

The [CJB](#) energizes the windshield washer pump during the up stroke of the first 2 wash/wipe cycles. This ensures that wiper fluid is pushed to the sides of the windshield and eliminates the trail of fluid which can occur if the fluid is pushed to the bottom of the windshield. The wipers will continue for 3 more cycles, followed after a delay of 4 seconds, by a single dry wipe.

- **NOTE:** The dry wipe feature is configurable using an approved Jaguar diagnostic system.

The operation of the washer pump on the wiper up stroke only is configurable using an approved Jaguar diagnostic system.

The washer button can be pressed and held and the wipers will operate continuously for up to 10 seconds. After this period when the button is released, the wipers will continue for 3 more cycles, followed after a delay, by a single dry wipe. After this period washing will be inhibited, the wipers will continue for 3 more cycles, followed after a delay, by a single dry wipe. Reactivating the switch will recommence the wash/wipe cycle.

RESERVOIR LEVEL SWITCH

The level switch is connected directly to the [CJB](#). The switch is operated by a float which closes contacts within the switch when the fluid level falls to below the switch level. When the contacts are closed a ground path is completed from the [CJB](#) through the switch. This is sensed by the [CJB](#) which issues a message to the instrument cluster which displays a low fluid level warning.

HEADLAMP POWERWASHERS

The headlamp powerwash is activated when the driver requests windshield washer operation. The [CJB](#) receives the driver request via a [CAN](#) bus message from the instrument cluster. The [CJB](#) then checks for an exterior lights active signal and that a low washer fluid level signal is not present.

The [CJB](#) outputs a control voltage to a headlamp powerwash pump relay located in the [EJB](#). The relay is energized by the [CJB](#) for a pre-determined period to allow the headlamp telescopic washers to operate.

The [CJB](#) monitors the driver washer requests and only operates the headlamp powerwash on every fourth request for windshield washer operation, provided that 10 minutes have elapsed since the last headlamp powerwash operation. The powerwash sequence is reset when the headlamps or the ignition is switched off.

- **NOTE:** If a low fluid reservoir level is present the [CJB](#) prohibits headlamp powerwash.

RAIN/LIGHT SENSOR

On receiving a request for automatic windshield wiper operation, the [CJB](#) interprets [LIN](#) bus messages received from the rain sensor. The rain sensor provides [LIN](#) bus messages with values ranging from 0 to 7.

A signal value of 0 is interpreted by the [CJB](#) as the windshield is dry. A signal value from 1 to 5 is interpreted by the [CJB](#) as a small amount of water hitting the windshield. In this instance, the [CJB](#) initiates a slow wipe. A signal value of 7 is interpreted by the [CJB](#) as a large amount of water hitting the windshield. In this instance, the [CJB](#) initiates a fast wipe.

- NOTE: The [CJB](#) will only change a fast wipe routine to a slow wipe routine if the rain sensor value is lower than 7.
- NOTE: **A** = Clean and dry windshield; **B** = Wet and dirty windshield

Component Description

WINDSHIELD WIPER MOTOR AND LINKAGE

- NOTE: LHD (left-hand drive) wiper linkage shown

E96944

ItemDescription

1	Quick release wiper blade attachment
2	RH wiper arm
3	Wiper blade (2 off)
4	LH (left-hand) wiper arm
5	Wiper arm cap (2 off)
6	Nut (2 off)
7	Wiper linkage location hole (hidden)
8	Pivot housing (2 off)
9	Screw and washer (2 off)
10	Wiper motor

The wiper linkage and motor assembly differs between [LHD](#) and [RHD \(right-hand drive\)](#) models. The wiper linkage and motor assembly is not available as separate service components. If the wiper linkage and motor assembly is replaced, it is important that alignment is made to marks on the windshield and the fixings are tightened in the correct order.

The wiper linkage and motor assembly is attached to the vehicle body with screws and washers at each end. The screws are located in rubber bushes in the linkage assembly which isolate the linkage from the vehicle body. A rubber grommet is located behind the motor and engages on a spigot on the vehicle body to locate the linkage.

The linkage assembly comprises a main tube with a pivot housing located at each end. The motor assembly is attached to the tube by a clamp plate and 4 screws. The motor output shaft is fitted with a crank. A link rod is connected to the motor crank and is connected at the opposite end to the [LH](#) pivot housing via a crank. The [LH](#) pivot housing crank is fitted with a second link rod which is connected directly to the crank on the [RH](#) pivot housing.

The motor crank converts rotary motion from the motor output shaft into linear movement of the link rods. The cranks connected to each pivot housing, convert the linear motion of the link rods back to rotary motion of the pivot housings. This rotary motion is passed to the wiper arms and blades causing the blades to wipe an arc across the windshield.

Each wiper arm is located on a taper spline on the respective pivot housing. A nut is screwed on the end of the pivot housing shaft and positively secures the wiper arm on the taper spline.

The wiper blades are attached to the wiper arms with a quick release fittings. The blades are of the flat blade type. These blades have an integral spring along their full length which curves the blade to match the windshield and provides even blade to windshield contact pressure along the entire length of the blade.

WASHER RESERVOIR

- NOTE: Type 'B' washer reservoir shown

E96945

ItemDescription

1	Scrivet
2	Windshield washer feed pipe to washer jets
3	Reservoir cap
4	Reservoir filler neck
5	Captive nut (2 off)
6	Headlamp powerwash feed pipe to telescopic washer jets
7	Screw and washer (2 off)
8	Grommet
9	Washer fluid level sensor
10	Windshield washer pump
11	Headlamp washer pump
12	Location spigot

The washer reservoir is located in the [RH](#) wheel arch. The reservoir is a plastic moulding and is secured in the wheel arch with 2 screws and washers and a scrivet. A level sensor is located in the reservoir and is connected to the [CJB](#). The reservoir is fitted with a washer pump which supplies pressurized washer fluid to the windshield washer jets mounted on the wiper arms.

A vehicle fitted with optional headlamp washers is fitted with a larger reservoir and an additional pump for the headlamp washers. The larger reservoir is identifiable by a letter 'B' moulded on the casing and has a capacity of 5.5 liters. Reservoirs moulded with the letter 'A' are for use on vehicles with windshield washers only and have a capacity of 4.4 liters.

A filler cap is located at the top of the reservoir and is accessible from the engine compartment.

The pumps are located in rubber sealing grommets in holes in the reservoir and secured with clips. The pump fluid hoses have quick release connectors which mate with the pumps. The fluid level sensor is a push fit into a sealing grommet in one side of the reservoir body.

HEADLAMP POWERWASHERS (if fitted)

E96949

ItemDescription

1	Powerwash trim cap
2	Washer jets
3	Self-tapping screws (2 off)
4	Pressure feed from powerwash pump
5	Telescopic arm

On vehicles with headlamp powerwash, each headlamp assembly is fitted with a headlamp powerwasher. The powerwasher is located on the underside of the headlamp assembly. The powerwasher is located in a clip at the front of the headlamp and secured with 2 self tapping screws to the headlamp body.

The powerwasher is a telescopic unit which extends forwards from the headlamp assembly under washer fluid pressure supplied by the headlamp powerwash pump. When the pump pressure decreases the powerwasher is automatically retracted back into the housing. The outer end of the powerwasher is fitted with a trim which blends the powerwasher into the headlamp when it is not operating. The powerwasher has two washer jets which direct washer fluid under high pressure onto the headlamp lens when the powerwasher is extended.

RAIN/LIGHT SENSOR

E84141

The rain/light sensor is located at the upper edge of the windshield, behind the interior rear view mirror. Contact between the rain sensor and windscreen is provided via a silicon pad which is compressed during the assembly process by two locking retaining clips either side of the sensor.

The rain/light sensor unit attaches to the windshield via two clips, which latch onto formed tags on the windshield bracket.

The sensor provides information to the [CJB](#) for the optimum wiper operation for the prevailing conditions to maintain the shield in a clear condition at all times. The rain/light sensor is an optical unit, which operates on an infrared waveband. The sensor uses the principle of the laws of reflection on interfacing surfaces between materials with differing refraction properties.

The rain/light sensor is connected to the [CJB](#) via a [LIN](#) bus. The sensor also receives a hardwired power and ground from the [CJB](#). The 'auto' wipers are activated when the column stalk is moved to position 1 (first position from off in the upward direction). The sensitivity of the sensor can be adjusted by rotating the sensitivity collar on the wiper column stalk in the clockwise or counterclockwise direction. Clockwise rotation will decrease sensitivity, while counterclockwise adjustment will increase sensitivity. An increase in sensitivity adjustment results in a single wipe of the front wiper motor.

• **NOTE:** The rain sensor also contains a light sensor. The light sensor is used to control operation of the automatic headlamps function.

Refer to: [Exterior Lighting \(417-01 Exterior Lighting, Description and Operation\)](#).

WIPER CONTROL SWITCH

The wiper control switch is located on the [RH](#) steering column multifunction switch. The switch allows selection of the following functions:

- Slow wipe
- Fast wipe
- Auto
- Flick wipe
- Windshield wash and headlamp powerwash (if fitted).

All wiper functions are connected to the instrument cluster by a resistor or series of resistors within the switch. The instrument cluster uses the returned current to determine the selected function.

WIPER SERVICE POSITION

The wiper service position allows the wipers to be parked in a position to allow easy access to the wiper blades for replacement. The service position is initiated by pulling the [RH](#) steering column multifunction switch towards the steering wheel and pressing the start/stop button to switch on the ignition. The wipers will move and stop in a vertical position on the windshield. The [RH](#) steering column multifunction switch can be released and the ignition switched off. The service position is terminated at the next ignition on cycle and the wipers return to their normal park position.

Wipers and Washers - Wipers and Washers

Diagnosis and Testing

Principle of Operation

For a detailed description of the wipers and washers, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (501-16 Wipers and Washers)

[Wipers and Washers](#) (Description and Operation),
[Wipers and Washers](#) (Description and Operation),
[Wipers and Washers](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Wiper blade(s) ● Wiper pivot arm shaft ● Washer reservoir ● Hose(s) ● Washer jet(s) 	<ul style="list-style-type: none"> ● Fuse(s) ● Wiring harness ● Electrical connector(s) ● Washer pump(s) ● Wiper motor

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

- NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.
- NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).
- NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
- NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.
- NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Roof Opening Panel - Roof Opening Panel - Overview

Description and Operation

Overview

The roof opening panel is operated through a two-way rocker switch located in the roof console. A motor, attached to the front of the roof-opening-panel frame, drives the glass panel to the tilt, open or closed positions using a pair of steel cables.

Tilt

With the roof opening panel closed, a press and release on the front of the rocker switch, tilts the rear of the panel upwards. If the switch is pressed again before the full tilt position is reached, the panel stops at the chosen position.

Fully open

With the roof opening panel closed, a press and release on the rear of the rocker switch, moves the panel to the fully open position automatically. It can be stopped at any point by pressing the button again.

Close

- From the fully open position, press and release the front of the switch. The panel will return to the closed position automatically.
- From the tilted position, press and release the rear of the switch. The panel will return to the closed position automatically.

Anti-trap

The roof opening panel has an 'anti-trap' function which prevents the panel from closing if an obstruction is sensed. When an obstruction is sensed, the motor will automatically retract the panel as far as possible. When the obstruction is removed, the panel can be closed by the normal method.

Roof opening sunblind

A sunblind integrated into the roof-opening-panel frame, is operated manually and can be opened or closed when the roof opening panel is in either the tilted or closed position. When the roof opening panel opens (slides rearwards) the sunblind automatically slides rearwards and cannot be pulled forward until the roof opening panel is in a forward position.

Rear window sunblind

The rear window sunblind is operated through a switch in the roof console.

Roof Opening Panel - Roof Opening Panel - System Operation and Component Description

4	Rear window sunblind, motor
5	ABS (anti-lock brake system) module
6	Roof opening panel, control module
7	Roof opening panel, rocker switch
8	CJB (central junction box)

System Operation

Roof opening panel

Operation of the roof opening panel is controlled by the roof opening panel control module, which is integral with the motor. The control module receives inputs from the CJB, which provides an 'open' or 'close' signal for remote handset operation, and an 'enable' signal when the vehicle enters power mode 6.

The control module also receives a vehicle speed signal from the ABS module. The vehicle speed signal is used by the control module to calibrate the anti-trap feature.

If the battery is disconnected, or the power supply is interrupted while the roof opening panel is in a partially open position, the motor and control module will need to be calibrated to restore full functionality. To recalibrate:

- Switch ignition on.
- Press the front of the switch, so the roof opening panel is in the tilt position, and then release the switch.
- Press the front of the switch and hold for thirty seconds.
- After thirty seconds the roof opening panel will begin to move. Keep the front of the switch pressed until the roof opening panel has fully opened and then closed.
- Once the open/close cycle has completed and the roof opening panel has stopped moving, release the switch.
- The roof opening panel can now be operated as normal.

Drain hoses are connected to the front and rear corners of the roof opening panel frame. The drain hoses are located inside of the cabin on the 'A' and 'D' post pillars to allow water, which has collected in the frame, to escape. One-way valves fitted to the end of each drain hose, prevent the ingress of dirt and moisture.

Rear window sunblind

The powered rear window sunblind is operated through a switch in the roof console. Power to the sunblind motor is provided by a pair of relays located in the CJB when the vehicle enters power mode 4. The sunblind motor is located beneath the rear parcel shelf and is supplied as a sealed unit with the sunblind mechanism.

If the battery is disconnected or a replacement sunblind is fitted, the motor will require re-calibrating. To re-calibrate the motor the sunblind should be powered through two-full cycles of movement.

Component Description

Roof opening panel, motor

The roof opening panel motor has a worm drive which drives a gear in the cast housing attached to the end of the motor. The gear has a small pinion gear attached to the outer part of its spindle. The pinion engages with two cables to form a rack and pinion drive. Rotation of the motor turns the pinion which in turn drives the cables in the required direction.

The two cables are attached either side of the pinion. One end of each cable is attached to the guide; the opposite end of each cable is held in position on the pinion by a metal insert in the frame. The cables run in channels, in the panel frame to the guides. As the panel is closed the cables are pushed through channels in the front of the frame. The displaced cable is guided into a further two channels in the frame, which protect the cable and prevent it from snagging. The cables manufactured from rigid spring steel can pull as well as push the panel along the guides.

The motor contains a micro-switch and Hall effect sensor. Signals received from these components enable the control module to calculate the exact position of the roof opening panel. The Hall effect sensor is also responsible for the operation of the anti-trap function.

If the anti-trap feature is activated while the roof opening panel is closing, the panel is reversed for 200mm or as far as possible. The Hall effect sensor, located in the motor, monitors the speed of the motor and if the speed decreases below a set threshold, indicating an obstruction, the power feed to the motor is reversed so the panel goes back. In an emergency the anti-trap function can be overridden by holding the switch in the closed position.

Roof opening panel, control module

The roof opening panel control module is integrated within the motor. The control module receives inputs from the CJB, which provides an 'open' or 'close' signal for remote handset operation, and an 'enable' signal when the vehicle enters power mode 6.

The control module also contains the algorithm for the anti-trap system and receives a vehicle speed signal from the ABS module. The vehicle speed signal is used by the control module to calibrate the anti-trap feature.

Roof Opening Panel - Roof Opening Panel

Diagnosis and Testing

Principle of Operation

For a detailed description of the roof opening panel, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (501-17 Roof Opening Panel)

[Roof Opening Panel](#) (Description and Operation),
[Roof Opening Panel](#) (Description and Operation),
[Roof Opening Panel](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Roof opening panel ● Helixed drive cables ● Switch ● Control unit/motor 	<ul style="list-style-type: none"> ● Fuses/relays (refer to electrical guide) ● Wiring harness ● Correct engagement of electrical connectors ● Loose or corroded connections

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action
B10F211	Sunroof Control	<ul style="list-style-type: none"> ● Sunroof enable signal circuit - short to ground 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Roof Opening Panel - Roof Opening Panel Alignment

General Procedures

1. With the roof opening panel closed, check the alignment of the glass to the roof panel. The glass should be central in its aperture. Profile of sunroof to body should be flush or up to 1.0 mm (0.40") low all round.

2. Open the roof opening panel blind.

3. Release the cover.
 - Repeat the above procedure for the other side.

5. 4. Loosen the 4 roof opening panel Torx screws.

- TORQUE: 4 Nm

6. Install the cover.
 - Repeat the above procedure for the other side.

7. Close the roof opening panel blind.

Roof Opening Panel - Motor Synchronization

General Procedures

1. NOTE: If a new component is installed.

Press and hold the front of the switch, hold down until the roof opening panel has completed a full open/close cycle.

- The roof opening panel is now synchronized.

2. NOTE: If the removed component is re-installed.

Press and hold the the front of the switch, the roof opening panel will move to the tilt position. Release the switch then press and hold the front of the switch, then the roof opening panel will move slightly more after 20 seconds.

- The roof opening panel is now un-synchronized.

3. NOTE: If the removed component is re-installed.

Press and hold the front of the switch, hold down until the roof opening panel has completed a full open/close cycle.

- This action must be done within 2-3 seconds of the last action.
- The roof opening panel is now synchronized.

Roof Opening Panel - Roof Opening Panel Front Drain Hose

Safety Belt System - Safety Belt System - Overview

Description and Operation

Authoring Template

OVERVIEW

A three point safety belt is fitted to all seating positions. Each safety belt retractor incorporates an emergency locking feature. The emergency locking retractor incorporates 2 mechanical inertia devices. One inertia device activates if the safety belt is subjected to a sharp pull. The second inertia device activates if the vehicle is subject to a sudden deceleration or is on a severe incline.

North American Specification (NAS) safety belt retractors also include an automatic locking feature. The Automatic Locking Retractor (ALR) is fitted to all passenger seating positions and allows the safety belt to be tensioned to aid the safe fitment of child or booster seats. For additional information, refer to the Owners Handbook.

NAS vehicles are also fitted with a belt tension sensor on the front passenger seat. The belt tension sensor is incorporated into the seat belt lower anchorage and is attached to the seat frame by an M10 Torx head bolt. The belt tension sensor forms part of the [SRS \(supplemental restraint system\)](#) occupancy detection and classification feature.

The center rear safety belt features a mini-buckle lower anchorage. The mini-buckle is disengaged by inserting a suitable tool into the small aperture on the front face of the housing.

To aid the fitment of child seats, 3 tethers are located on the rear parcel shelf. Each tether is attached to the parcel shelf with an M10 Torx head bolt.

A safety belt warning indicator is located in the instrument cluster to remind front seat passengers to fasten their safety belts. The warning indicator will illuminate if the safety belt of an occupied front seat is not fastened. Refer to: Instrument Cluster (413-01, Description and Operation).

Component Tests

Poor Retraction

WARNING: In the event of an accident in which the air bags have been deployed, the front safety belts that were in use, and the rear safety belts whether in use or not, at the time of the accident must be removed and NEW safety belts MUST be installed. Failure to follow this instruction may result in personal injury and component failure.

If a safety belt does not retract correctly, check that the anchor covers and trim bezels are correctly installed and not rubbing against the safety belt webbing. Where necessary, check the safety belt webbing is not rubbing at one end of the retractor cover slot and if so, correct by loosening the retaining bolt, aligning the retractor to centralize the safety belt webbing and re-tighten the bolt.

The vehicle is equipped with two front and three rear inertia reel safety belts. These safety belts are "dual sensitive" which means that they have:

- a vehicle motion sensor, which locks the safety belt webbing under braking, cornering, on steep hills and in adverse camber conditions
- a webbing motion sensor, which locks when the safety belt webbing is quickly extracted

Both systems should be fully operational and can be checked by the tests below:

Vehicle Motion Sensor Test

Either of the following two procedures may be used to check correct operation of the vehicle motion sensor. Both methods require two people but note that people of larger than average build should not be asked to conduct these tests. This is to avoid the possibility of a fully unrolled safety belt webbing being mistaken for a correctly locked safety belt retractor.

Test Method 1 (braking)

WARNING: It is important that during this test, the wearer allows the safety belt to provide the restraint, the wearer should not attempt to anticipate the sudden deceleration and the driver should not brace themselves against the steering wheel. However, both the driver and the passenger must prepare themselves for the possibility that the safety belt will not lock. The passenger should hold their hands in front of him, just clear of the instrument panel or front seat backrest. Depending on which belt is being tested. Failure to follow these procedures may result in personal injury.

- Select for this test, a quiet or private stretch of road. Make sure that the road is clear and that full visibility is maintained at all times
- Both driver and passenger should adopt a normal, comfortable seating position. Both occupants should wear the safety belts and the safety belt webbing must be correctly adjusted, with no slack
- Proceed at a speed of approximately 10 km/h (6 miles/hour), do not exceed 10 km/h (6 miles/hour) for this test
- When safe to do so, apply the foot brake sharply to stop the vehicle. If the vehicle motion sensitive lock mechanism is operating correctly, the safety belt webbing will lock and restrain the wearer
- Conduct the test twice in each front and rear passenger seat position
- Any safety belt retractor which does not restrain the wearer during this test must not be used. A NEW safety belt must be installed

Test Method 2 (turning circle)

This method requires a flat open area of private road, sufficient for the vehicle to be driven safely in a continuous circle on full lock.

- The driver should wear the safety belt provided and the belt webbing must be correctly adjusted, with no slack
- The passenger should occupy a rear seat with the safety belt correctly adjusted
- Start the engine and, with the steering on full right-hand lock, drive the vehicle in a continuous circle at 16 km/h (10 miles/hour), do not exceed 16 km/h (10 miles/hour)
- When the speed is stable, the passenger should attempt to slowly extract the safety belt webbing from each safety belt retractor in turn. If the vehicle motion sensitive lock mechanism is operating correctly, it will not be possible to extract the webbing
- Any safety belt retractor from which it is possible to extract the webbing during this test must not be used. A NEW safety belt must be installed

Safety Belt Webbing Sensor Test

With the vehicle stationary and on level ground take firm hold of the safety belt webbing (on the tongue side of the upper safety belt anchor) and pull out quickly. The retractor should lock within 0.25 metre (10 inches), preventing further webbing pullout. Any safety belt retractor from which it is possible to extract further webbing must not be used. A NEW

safety belt must be installed.

Service Installation of Safety Belts

It is possible that the safety belt assemblies installed in service may have been damaged during handling or installation to the vehicle. The damage is contained within the inner workings of the retractor and is therefore, not visible. However, the damage usually causes the retractor to stick or jam. The damage can only occur before installation is completed and is usually in one of the following ways:

- The safety belt webbing is allowed to retract onto the spindle until it jams the locking mechanism in a way that cannot occur when the safety belt is installed in the car. The safety belt webbing prevents the correct locking action and if the safety belt webbing is snatched or jerked out of the retractor, the loads are not taken on this high strength locking mechanism
- The webbing is snatch loaded by attempted fast extraction or manual testing with the safety belt held in the hand. This can result in deceleration which are much higher than those occurring in accident situations and there is a risk of damage to the mechanism

When handling safety belt assemblies, adopt the following procedures:

WARNING: If the following procedures are not successful, reject the safety belt assembly. Do not try to jerk or snatch the webbing out of the retractor as this may cause damage. Failure to follow these procedures may cause damage or personal injury.

- If the safety belt webbing retracts and will not extract under low webbing tension, install the retractor onto its mounting in the car, which will set it at its correct angle, and the safety belt webbing should extract easily
- If it does not, feed 5-10 mm (3/16 - 3/8 inch) more safety belt webbing onto the spindle (rotate the spindle using finger pressure if necessary) and the safety belt webbing should then extract

Pinpoint Test

PINPOINT TEST A : DIAGNOSTIC GUIDE FOR THE SECOND AND THIRD ROW SAFETY BELTS	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: SAFETY BELT	
<p>• NOTE: During normal conditions the (ALR) automatic locking retractor can operate giving the impression of a jammed safety belt this can be overcome by drawing 20mm of webbing from the belt reel with moderate force, the belt reel should then operate correctly. Check the operation, if the webbing moves freely then retracts correctly no further action required, do not replace safety belt.</p>	
	<p>1 Visually inspect the condition of the safety belt.</p>
	<p>Is the safety belt fully retracted? Yes The safety belt is fully retracted, no slack in the webbing. GO to A2. No Not fully retracted, the webbing is slack. GO to A3.</p>
A2: REQUIRED FORCE	
	<p>1 Draw the webbing from the safety belt reel with moderate force then release the webbing. Carry out this operation twice.</p>
	<p>Does the webbing move freely then retract correctly? Yes No further action required, do not replace safety belt. No GO to A3.</p>
A3: WEBBING SLACK - NOT FULLY RETRACTED	
	<p>1 Remove any trim panels to expose the D loop (anchor point) and safety belt reel. Check the webbing is not trapped or twisted.</p>
	<p>Does the webbing move freely then retract correctly? Yes While refitting the trim panels, ensure there are no obstruction and the webbing does not catch or rub. Check the operation, if the webbing moves freely then retracts correctly no further action required, do not replace safety belt. No GO to A4.</p>
A4: TRAPPED OR TWISTED SAFETY BELT WEBBING	
	<p>1 If the webbing is twisted due to a fold passing through the anchor point (do not remove the safety belt reel) feed the twist back through the anchor point to remove. If the webbing is trapped, release and inspect for damage, if the webbing is damaged replace the safety belt.</p>
	<p>Does the webbing move freely then retract correctly? Yes If the webbing moves freely then retracts correctly no further action required, do not replace safety belt. While refitting the trim panels, ensure there are no obstruction and the webbing does not catch or rub. No GO to A5.</p>
A5: SAFETY BELT WEBBING GUIDE LOCATION	
<p>• NOTE: The safety belt reel has a guide installed that can cause the safety belt reel to operate poorly if incorrectly located.</p>	
	<p>1 Visually and manually inspect the safety belt reel webbing guide for location and installation.</p>
	<p>Is the safety belt reel webbing guide for location and installation correct and secure? Yes GO to A6. No</p>

Refit the safety belt reel webbing guide ensure the fixing lug is properly located in the retractor frame. When correct draw the full length of the webbing from the reel then allow the belt to retract, the webbing will now be central on the spindle. Check the operation, if the webbing moves freely then retracts correctly, no further action required, do not replace safety belt. While replacing the trim panels, ensure there are no obstruction and the webbing does not catch or rub.

A6: SAFETY BELT REEL LOCATION

• **NOTE:** [Incorrect installation / location of the safety belt reel can affect operation.](#)

	<p>1 Confirm that the safety belt reel is correctly installed, check for correct location of both anti rotational pins if present.</p>
	<p>Is the safety belt reel is correctly installed?</p> <p>Yes Check the operation, if the webbing moves freely then retracts correctly, no further action required, do not replace safety belt. While replacing the trim panels, ensure there are no obstruction and the webbing does not catch or rub.</p> <p>No Correctly install the safety belt reel ensuring correct location of both anti rotational pins if present. Check the operation, if the webbing moves freely then retracts correctly, no further action required, do not replace safety belt. While replacing the trim panels, ensure there are no obstruction and the webbing does not catch or rub.</p>

Supplemental Restraint System - Air Bag and Safety Belt Pretensioner

Supplemental Restraint System (SRS) - Overview

Description and Operation

OVERVIEW

WARNING: All pyrotechnic devices are dangerous. Before performing any procedures on any pyrotechnic device, read all information contained within the Standard Workshop Practices section of this manual. Refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).

The [SRS \(supplemental restraint system\)](#) provides additional protection for the vehicle occupants in certain impact conditions. The system is controlled by the [RCM \(restraints control module\)](#), which is mounted beneath the floor console. The system includes twin stage drivers and front passenger airbags.

The [RCM](#) receives inputs from various sensors around the vehicle and determines which, if any, airbags should be deployed.

The [SRS](#) features an occupant detection system. The occupant detection system comprises a mat fitted inside the front passenger seat. By monitoring the condition of the mat, the [RCM](#) can determine if the front passenger seat is occupied. It uses this information to determine which airbags to deploy in the event of an impact. This information is also used to illuminate the safety belt instrument cluster warning lamp if the front passenger seat is occupied and the safety belt is not engaged.

North American Specification (NAS) vehicles also feature an occupant classification system. The occupant classification system comprises a control module, pressure pad and safety belt tension sensor. The system can determine the size and weight of the front seat passenger. This information is transmitted to the [RCM](#) over the high speed [CAN \(controller area network\)](#) bus. The [RCM](#) uses this information to help determine which airbags to deploy in the event of an impact.

System Operation

System Operation

In a collision, the sudden deceleration or acceleration is measured by the impact sensors and the accelerometers in the restraints control module. The restraints control module evaluates the readings to determine the impact point on the vehicle and whether the deceleration/acceleration readings exceed the limits for firing any of the air bags, pretensioners, and battery disconnect unit. During a collision, the restraints control module only fires the air bags and pretensioners if the safing function confirms that the data from the impact sensor(s) indicates an impact limit has been exceeded.

The restraints control module incorporates the following impact thresholds to cater for different accident scenarios:

- Front impact, pretensioners
- Front impact, driver and passenger air bags stage 1, belt unfastened
- Front impact, driver and passenger air bags stage 1, belt fastened
- Front impact, driver and passenger air bags stage 2, belt unfastened
- Front impact, driver and passenger air bags stage 2, belt fastened
- Rear impact
- Driver side impact
- Passenger side impact.

The front impact thresholds increase in severity from pretensioners, through to driver and passenger air bag stage 2, belt fastened.

Firing Strategies

The safety belt pretensioners are fired when the pretensioner impact limit is exceeded. The [RCM](#) only fires the pretensioners if the related safety belt is fastened.

The driver and passenger air bags are only fired in a frontal impact. If an impact exceeds a stage 1 limit, but is less than the corresponding stage 2 limit, only one inflator in each air bag is fired (stage 2 is still fired for disposal after a delay of 100ms). If an impact exceeds the stage 2 limit, the two inflators in each air bag are fired simultaneously.

The passenger air bag is disabled unless the front passenger seat is occupied by a large person (NAS only), or the passenger air bag deactivation switch is on (all except NAS & AUS).

The stage 2 inflator of the driver air bag is disabled if the driver seat is forward of the switching point of the seat position sensor.

If there is a fault with a safety belt buckle sensor, the [RCM](#) assumes the related safety belt is fastened for the pretensioner firing strategy and unfastened for the driver and passenger air bag firing strategies. If there is a fault with the occupant classification sensor, the [RCM](#) disables the passenger air bag. If there is a fault with the passenger air bag deactivation switch, the [RCM](#) disables the passenger air bag.

If a side impact limit is exceeded, the [RCM](#) fires the side air bag and the side head air bag on that side of the vehicle. If the side impact limit on the front passenger side of the vehicle is exceeded, the [RCM](#) also evaluates the input from the occupant classification sensor, and fires the side air bag only if the front passenger seat is occupied by a large person (NAS only).

If multiple impacts occur during a crash event, after responding to the primary impact the [RCM](#) will output the appropriate fire signals in response to any further impacts if unfired units are available.

Front and Rear Impact Firing Strategy (All Except NAS)

Safety Belt Status		Strategy		
Driver	Passenger	Applicable Pretensioner	Driver Air Bag	Passenger Air Bag
Fastened	-	Fired at pretensioner threshold	Fired at belt fastened threshold	-
Unfastened	-	Not fired	Fired at belt unfastened threshold	-
-	Fastened	Fired at pretensioner threshold	-	Fired at belt fastened threshold
-	Unfastened	Not fired	-	Fired at belt unfastened threshold

Front and Rear Impact Firing Strategy (NAS Only)

Safety Belt Status		Passenger Seat Status	Strategy		
Driver	Passenger		Applicable Pretensioner	Driver Air Bag	Passenger Air Bag
Fastened	-	-	Fired at pretensioner threshold	Fired at belt fastened threshold	-
Unfastened	-	-	Not fired	Fired at belt unfastened threshold	-
-	Fastened	Occupied allow	Fired at pretensioner threshold	-	Fired at belt fastened threshold
-	Fastened	Unoccupied inhibit/empty	Fired at pretensioner threshold	-	Not fired
-	Unfastened	Occupied allow	Not fired	-	Fired at belt unfastened threshold
-	Unfastened	Unoccupied inhibit/empty	Not fired	-	Not fired

The battery disconnect unit is fired:

- At driver and passenger air bag belt fastened threshold in a frontal impact
- At the driver and passenger side impact threshold in a side impact
- At the rear impact threshold in a rear impact.

Crash Signal

When the [RCM](#) outputs any of the fire signals it also outputs a crash signal to the [RJB](#) and the [ECM \(engine control module\)](#) on the High speed [CAN](#). The crash signal is also hardwired to the [ECM](#) and the [RJB](#). The instrument cluster picks up the crash signal from the High speed [CAN](#) and gateways it to the [LCM \(lighting control module\)](#). On receipt of the crash signal, the [RJB](#) goes into a crash mode and the [ECM](#) cuts the power supply to the fuel pump relay. In the crash mode, the [RJB](#):

- Activates all of the unlock signals of the vehicle locking system, even if the vehicle is already unlocked.
- Ignores all locking/superlocking inputs until it receives an unlock input, when it returns the locking system to normal operation.
- Activates the interior lamps. The interior lamps remain on permanently until they are manually switched off at the lamp unit, or the [RJB](#) crash mode is switched off and they return to normal operation.
- Disables the rear window child lock input until the crash mode is switched off.
- Sends a crash message to the [LCM](#), to activate the hazard flashers. The hazard flashers remain on until cancelled by the hazard warning switch or the crash mode is switched off.

The [RJB](#) crash mode is switched off by a valid locking and unlocking cycle of the locking system.

Component Description

Restraints Control Module

E87578

The [RCM](#) is installed on the top of the transmission tunnel, in line with the B pillars, and controls operation of the [SRS \(supplemental restraint system\)](#). The main functions of the [RCM](#) include:

- Crash detection and recording
- Air bag and pre-tensioner firing
- Self test and system monitoring, with status indication via the air bag warning lamp and non volatile storage of fault information.

The [RCM](#) determines which elements of the [SRS](#) are to be deployed by using two internal areas:

- Crash severity evaluation
- Deployment handler.

Crash severity evaluation evaluates crash severity by using data from the [RCM](#) internal accelerometer, the front crash sensor and the safety belt buckle sensor. Based on this data, the [RCM](#) decides which level of air bag module deployment is required and forwards the information to the second area, the deployment handler.

The deployment handler evaluates the status of the seat track position sensor and safety belt buckle sensors before a decision is made about which restraints should finally be deployed.

Data from the side crash sensors is used by the [RCM](#) in conjunction with acceleration data from the [RCM](#) internal accelerometer to make a deployment decision. The [RCM](#) processes the acceleration data and subject to an impact being of high enough severity, decides whether the side air bag module should be deployed.

On board testing of the air bag modules, front safety belt pretensioner firing circuits, warning indicator circuits and module status (the crash and side impact sensors perform basic self-tests) is performed by the [RCM](#) together with the storing of fault codes.

The [RCM](#) drives the [SRS](#) indicator on the instrument pack via a [CAN](#) signal. If the warning lamp fails, a fault code is recorded and a warning tone is sounded in place of the lamp if a further fault occurs. It also provides a temporary back-up power supply to operate the air bag modules in the event that in crash conditions, the battery supply is lost. In the event of a crash, it records certain data which can be accessed via the diagnostic connector.

A safing sensor in the [RCM](#) provides confirmation of an impact to verify if air bag and pretensioner activation is necessary. A roll-over sensor monitors the lateral attitude of the vehicle. Various firing strategies are employed by the [RCM](#) to ensure that during an accident only the appropriate air bags and pretensioners are fired. The firing strategy used also depends on the inputs from the safety belt switches and the occupant monitoring system.

An energy reserve in the [RCM](#) ensures there is always a minimum of 150 milliseconds of stored energy available if the power supply from the ignition switch is disrupted during a crash. The stored energy is sufficient to produce firing signals

for the driver air bag, the passenger air bag and the safety belt pretensioners.

When the ignition is switched on the [RCM](#) performs a self test and then performs cyclical monitoring of the system. If a fault is detected the [RCM](#) stores a related fault code and illuminates the air bag warning indicator. The faults can be retrieved by the recommended Jaguar diagnostic tool over the [CAN](#) bus. If a fault that could cause a false fire signal is detected, the [RCM](#) disables the respective firing circuit, and keeps it disabled during a crash event.

Clock Spring

E98177

The clockspring is installed on the steering column to provide the electrical interface between the fixed wiring harness of the steering column and the components that rotate with the steering wheel, i.e. the driver air bag, the horn and the steering wheel switch packs.

The clockspring consists of a plastic cassette which incorporates an outer cover fixed to the steering column and an inner rotor which turns with the steering wheel. Four securing lugs attach the cover to the multifunction switch on the steering column. The rotor is keyed to the steering wheel by a drive peg. A lug on the underside of the rotor operates the self-cancelling feature of the turn signal indicator switch. A ribbon lead, threaded on rollers in the rotor, links two connectors on the cover to two connectors on the rotor. Link leads for the driver air bag are installed in one of the connectors on the rotor.

To prevent damage to the ribbon lead, both the steering and the clockspring must be centralized when removing and installing the clockspring or the steering wheel. The clockspring is centralized when the drive peg is at six o'clock and 50 - 100% of a yellow wheel is visible in the viewing window.

Replacement clocksprings are fitted with a stopper, which locks the cover to the rotor, in the central position. The stopper must be broken off when the replacement clockspring is installed.

Drivers Airbag Module

E98175

The driver air bag module is controlled by the [RCM](#) which chooses between single or dual stage deployment, depending on the occupant position and the crash severity. To reduce the risk of an air bag module induced injury to a driver that is positioned close to the steering wheel, the air bag module deploys radially. It has a non-azide propellant that reduces particulates and effluents. It consists of a two stage inflator with separate chambers for the two inflation stages, each being independently activated by the [RCM](#). It has two electrical connectors that are color coded and mechanically keyed to the respective connector on the inflator.

Passenger Airbag Module

E98176

The passenger airbag module is controlled by the [RCM](#) which chooses between single or dual stage deployment, depending on the occupant status and the crash severity. It consists of a two stage inflator with two air bag electrical connectors to accommodate the two stage inflation.

The heated gas inflator consists of a high-pressure mix of clean air and hydrogen gas, triggered by two separate ignition squibs. It produces a controlled generation of clean gas to rapidly fill the air bag. It is classified as a stored flammable gas (not as an explosive) and as such, has less restrictive storage and transportation requirements. It produces a very clean burn and almost no particulates and is almost free of any toxins, making disposal or recycling much easier.

Head Airbag

E98180

Side air curtains protect against head injuries in a side impact, while also helping to ensure unrestrained occupants are not ejected through open or broken windows during a rollover event.

A single inflator mounted behind the rear seat unfurls the curtain and fills five separate chambers to provide head protection cushions for occupants in side-impact and roll-over events. Steel ramps guarantee the curtain does not snag on the interior trim as it unfurls, while tethers at the front and rear of the curtain ensure the curtain is held taut.

The side air curtain deflation characteristics are deliberately slow to ensure it remains inflated throughout the duration of a vehicle rollover event.

Side Airbag Module

E98181

A side air bag is attached to the outside of each front seat backrest frame, under the backrest cover.

The side air bags are handed, and each consist of a molded plastic case which contains the folded air bag and the inflator. A cable connects the igniter of the inflator to a connector in the main seat harness connector block located under the front edge of the seat cushion.

When the air bag deploys it forces the front edge of the molded plastic case apart and splits open the backrest cover.

The side air bags use compressed argon as the inflation medium. The inflated volume of each side air bag is 12 liters (0.42 ft³).

Impact Sensors

E98182

Impact sensors are installed in the front and both sides of the vehicle. The use of multiple impact sensors provides shorter air bag trigger times, through faster detection of lateral and longitudinal acceleration, and improves detection accuracy.

There are two front impact sensors, attached to the headlamp surround panel below the headlamps.

There are four side impact sensors located in the passenger compartment, as follows:

- One attached to the base of each B/C pillar
- One attached to the base of each D pillar.

Each impact sensor incorporates an accelerometer and a microchip powered by a feed from the [RCM](#). The power feed also provides the interface connection through which the side impact sensor communicates with the [RCM](#) using serial data messages. Acceleration is evaluated by the microchip and transmitted to the restraints control module, which then makes the decision on whether or not to activate the air bags and pretensioners.

When the ignition is switched on the [RCM](#) supplies power to the impact sensors, which perform a self test. After

satisfactory self tests the impact sensors continually output 'digital acceleration' messages to the restraints control module. If a fault is detected the relevant impact sensor sends a fault message, instead of the digital acceleration message, to the restraints control module. The [RCM](#) then stores a related fault code and illuminates the air bag warning indicator. Faults can be retrieved by the Jaguar approved diagnostic system from the [RCM](#) via the high speed [CAN](#) bus connection.

Seat Position Sensor

The seat position sensor allows the [RCM](#) to detect when the driver seat is forward of a given point on the seat track. The seat position sensor consists of a Hall effect sensor attached to the driver seat frame. While the ignition is on, the [RCM](#) supplies the sensor with power, and monitors the return current. When the seat frame moves forwards, the sensor moves over the edge of the seat track, which changes the reluctance of the sensor. The change of current is detected by the [RCM](#) and used as a switching point. The switching point is when the center of the sensor is 3 ± 4 mm from the leading edge of the seat track.

When the driver seat is forward of the switching point, the [RCM](#) increases the time delay between firing the two stages of the inflator in the driver air bag. When the driver seat is rearward of the switching point, the [RCM](#) uses the normal time delay between firing the two stages.

Safety Belt Sensor

A safety belt switch is installed in the buckle of each front safety belt to provide the [RCM](#) with a status signal of the related safety belt(s). When the safety belt is unfastened the switch outputs a low current to the [RCM](#). When the safety belt is fastened the switch outputs a high current to the [RCM](#).

Pretensioners

The pretensioners are used to tighten the front safety belts during a collision to ensure the occupants are securely held in their seats. A pretensioner is integrated into each front safety belt buckle and attached to a bracket on the inboard side of the seat.

Each pretensioner has a tube containing propellant and a piston. The piston is attached to a steel cable, the opposite end of which is attached to the safety belt buckle. A squib in the base of the tube provides an ignition source when triggered by a fire signal from the [RCM](#).

On receipt of a fire signal from the [RCM](#), the squib ignites the propellant. The propellant produces nitrogen gas that rapidly expands to drive the piston along the tube, pulling the cable and drawing the buckle downwards.

Airbag Warning Indicator

E73665

The air bag warning indicator consists of a red [LED](#) behind a [SRS](#) graphic in the instrument cluster.

Operation of the air bag warning indicator is controlled by a high speed [CAN](#) bus message from the [RCM](#) to the instrument cluster. The [RCM](#) sends the signal to illuminate the air bag warning indicator if a fault is detected, and for approximately 6 seconds during the bulb check at the beginning of each ignition cycle.

Occupant Monitoring

There are two types of occupant monitoring:

- In all markets except NAS & Australia, vehicles have an occupant detection sensor
- In NAS markets, vehicles have an occupant classification system

For markets which have an occupant detection sensor, this has no interface with the restraints system and only provides the belt reminder function.

For markets that have an occupant classification system, this provides the [RCM](#) with the occupancy status of the front passenger seat. The restraints control module uses this and the seat buckle status in the evaluation of the firing strategy for the passenger front air bag, side air bag, and pretensioner.

Safety Belt Sensors

The buckle of each front safety belt incorporates a Hall effect sensor that provides a safety belt status signal to the [RCM](#). The [RCM](#) broadcasts the status of the two front safety belts on the high speed [CAN](#) bus for use by the instrument cluster. In the event of a front impact the [RCM](#) will deploy the pretensioners provided the safety belt buckles are fastened. The safety belt buckle pretensioners have a lower deployment threshold than that required by the air bags. Hence it is possible during a minor collision, which exceeds the deployment threshold, that only the safety belt buckle pretensioners will deploy.

Passenger Airbag Deactivation Indicator

Passenger Airbag Deactivation Warning Lamp

E98223

The passenger air bag deactivation indicator is installed on the center switch pack of the instrument panel. When appropriate, the indicator illuminates to advise front seat occupants that the passenger air bag is disabled. Operation of the indicator is controlled by the RCM (restraints control module) . The [RCM](#) illuminates the indicator when:

- There is a fault with the passenger air bag firing circuit(s).
- The passenger air bag is deactivated with the passenger air bag deactivation switch (where fitted).
- Required by passenger seat occupant monitoring (see below).

Passenger Airbag Deactivation Switch (All Except NAS)

The passenger air bag deactivation switch provides a method of manually disabling the passenger air bag. The switch is installed in the front passenger end of the instrument panel and operated by the ignition key.

When the passenger air bag deactivation switch is operated, it changes a ground connection between two pins in the connectors of the [RCM](#) . When the passenger air bag deactivation switch is selected to OFF, the [RCM](#) disables the passenger air bag and, if the front passenger seat is occupied, illuminates the passenger air bag deactivation indicator.

Occupant Detection System

E98174

There are two types of occupant monitoring:

- In all markets except NAS & Australia, vehicles have an occupant detection sensor
- In NAS markets, vehicles have an occupant classification system

For markets which have an occupant detection sensor, this has no interface with the restraints system and only provides the belt reminder function.

For markets that have an occupant classification system, this provides the [RCM](#) with the occupancy status of the front passenger seat. The [RCM](#) uses this and the seat buckle status in the evaluation of the firing strategy for the passenger front air bag, side air bag, and pretensioner.

Occupant Classification System

E98173

The occupant classification system can determine if the front passenger seat is unoccupied, occupied by a small person, or occupied by a large person. The occupant classification system consists of:

- A pressure pad, installed under the cushion of the front passenger seat, which is connected to a pressure sensor
- A safety belt tension sensor, integrated into the anchor point of the front passenger safety belt
- An occupant classification module, installed under the front passenger seat.

The pressure pad is a silicone filled bladder. Any load on the pressure pad is detected by the pressure sensor.

The safety belt tension sensor is a strain gauge that measures the load applied by the safety belt anchor to the anchor bolt. The sensor is located in the lower safety belt anchor point.

SAFETY BELT TENSION SENSOR

E98178

The occupant classification module supplies a reference voltage to the pressure sensor and the safety belt tension sensor and, from the returned signals, measures the loads acting on the pressure pad and the safety belt tension sensor. The load measurement from the safety belt tension sensor is used to produce a correction factor for the load measurement from the pressure pad. The tightness of the safety belt affects the load acting on the pressure pad, so without the correction factor the occupant classification module cannot derive an accurate occupancy status.

The occupant classification module translates the load readings into a seat occupancy status and transmits the result to the [RCM](#), on a dedicated high speed [CAN](#) bus link. The occupant classification module incorporates two load limits for the seat cushion: When the load exceeds the lower limit, but is less than the upper limit, the occupant is classified as small; when the upper limit is exceeded, the occupant is classified as large.

Supplemental Restraint System - Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

Diagnosis and Testing

Principle of Operation

For a detailed description of the supplemental restraints system and operation, refer to the relevant Description and Operation section in the workshop manual. REFER to: (501-20B Supplemental Restraint System)

[Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) (Description and Operation),
[Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) (Description and Operation),
[Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) (Description and Operation).

Inspection and Verification

WARNING: TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BACKUP POWER SUPPLY MUST BE DEPLETED BEFORE REPAIRING OR REPLACING ANY AIR BAG SUPPLEMENTAL RESTRAINT SYSTEM (SRS) COMPONENTS. TO DEplete THE BACKUP POWER SUPPLY ENERGY, DISCONNECT THE BATTERY GROUND CABLE AND WAIT ONE MINUTE. FAILURE TO FOLLOW THIS INSTRUCTION MAY RESULT IN PERSONAL INJURY.

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

• **NOTE:** Given the legal implications of a restraints system failure, harness repairs to Air Bag module circuits are not acceptable. Where the text refers to "REPAIR the circuit", this will normally mean the replacement of a harness.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Electrical
<ul style="list-style-type: none"> ● Battery condition, state of charge ● Make sure all electrical connector(s) are engaged correctly on the air bag circuits ● Wiring harness ● Air bag module(s) ● Make sure the restraints control module (RCM) is correctly installed ● Fuse(s) ● Sensor(s) ● Pretensioner(s) ● Warning lamp bulb(s)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

Restraints Control Module

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).

• **NOTE:** When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

U3003-62	Battery Voltage - Signal compare failure	<ul style="list-style-type: none"> Mis-match in battery voltage, of 2 volts or more, between RCM and RJB 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system

Occupant Classification System (OCS)

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).

• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Supplemental Restraint System - Air Bag Disposal

General Procedures

Deployed Air Bag

-  **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

Deployed air bag modules are to be disposed of as special waste and must comply with local environmental requirements, if in doubt, contact Authority for disposal requirements.

- NOTE:** The storage, transportation, disposal, and/or recycling of air bag module components must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety, and transportation.

Modules removed and deployed by Jaguar service are to be returned to the importer for disposal.

Undeployed Air Bag — Inoperative

-  **WARNING:** Carry a live air bag module with the air bag and trim cover or deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

- NOTE:** All inoperative air bag modules have been placed on the Mandatory Return List. All discolored or damaged air bag modules must be treated the same as any inoperative live air bag being returned. Failure to follow this instruction may result in personal injury.

Remove the inoperative driver air bag module or passenger air bag module. For additional information [Driver Air Bag Module](#) or [Passenger Air Bag Module](#) in this section.

Undeployed Air Bag — Scrapped Vehicle

Remote Deployment

- WARNINGS:**

 Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

 Carry a live air bag module with the air bag and trim cover or deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

 Remote deployment is to be carried out outdoors with all personnel at least 6.1 meters (20 feet) away to ensure personal safety. Due to the loud report which occurs when the air bag is deployed, hearing protection is required. Failure to follow this instruction may result in personal injury.

 Do not place the driver or passenger air bag module with the trim cover or deployment door facing down, as the forces of the deploying air bag can cause it to ricochet and cause personal injury. Failure to follow this instruction may result in personal injury.

Equipment required: Universal deployment tool-Part N° 418-135 and 12V Battery.

- The deployment procedure should be carried out outdoors away from other personnel.

3. Remove any loose debris from around air bag. Make sure that no flammable liquids are present.
4. Disconnect the battery ground and positive cables.
5. Disconnect the relevant air bag module electrical connector.
6. Connect the appropriate adaptor lead to the restraint device.
7. Connect the deployment lead to the adaptor lead. Pass wire of the deployment tool through window, close all doors, leave window with lead for deployment tool open.

8.  **WARNING:** Before proceeding, make sure precautions have been taken to warn personnel of a possible loud noise upon activation. Do not allow anybody to approach closer to restraint device than six meters. Failure to follow this instruction may result in personal injury.

Move as far from restraint device as possible and connect the tool clips to a 12V vehicle battery.

9.  **WARNING:** Do not handle the deployed device immediately after activation - it may be hot. Allow the unit to cool for at least 20 minutes. Cooling modules should be continuously monitored to make sure heat does not create a fire with spilled liquids or other debris. Failure to follow this instruction may result in personal injury.

Deploy the module by depressing both switches on the tool. If activation does not occur, disconnect battery from tool and seek advice from Jaguar Engineering and wait for further instructions.

10. Repeat procedure for all air bags in vehicle.
11. The vehicle is now to be scrapped in the normal manner with modules installed.

Disposal of live air bag modules for all air bags, using tyres

1. Equipment required: Deployment tool 418-S135, Battery (12V), Safety goggles to BS2092 grade 2, Rubber gloves to PrEN 374 class 2, Ear protectors that have been measured to BS.EN 24869, Particulate respirator to EN 149 grade FFP2S
2. The deployment procedure should be carried out outdoors, away from other personnel.
3. Stack four scrap tyres, securing together with heavy gauge wire or cable. while disconnected from any electrical power source, connect deployment harness and place air bag adaptor portion under tyre stack, ready for connection to air bag.

4.  **WARNING:** Power must not be connected during this step. Failure to follow this instruction may result in personal injury.

 **CAUTION:** Make sure the connector is not in contact with the inflator or it will be damaged during the test.

Connect air bag to air bag connector, make sure the locking sleeve is fully engaged. position the air bag with the cover facing upwards.

5. Make sure battery connections of deployment harness are ten meters away from the tyre stack
6. Remove any loose from around the air bag . Make sure that no flammable liquids are present.

7.  **WARNING:** Before proceeding, make sure precautions have been taken to warn personnel of a possible loud noise upon activation. Do not allow anybody to approach closer to restraint device than six meters. Failure to follow this instruction may result in personal injury.

Move as far from restraint device as possible and connect the tool clips to a 12V vehicle battery.

8.  **WARNING:** Do not handle the deployed device immediately after activation - it may be hot. Allow the unit to cool for at least 20 minutes. Cooling modules should be continuously monitored to make sure heat does not create a fire with spilled liquids or other debris. Failure to follow this

instruction may result in personal injury.

Deploy the module by depressing both switches on the tool. If activation does not occur, disconnect battery from tool and seek advise from Jaguar Engineering and wait for further instructions.

9. Allow the air bag to cool for at least 20 minutes. Cooling modules should be continuously monitored to make sure heat generated a fire with spilled liquids or other debris.
10. Remove the air bag from the tyre stack and seal in a plastic bag, ready for disposal.
11. In the event of any problems or queries arising from this procedure, contact Jaguar Engineering.

Supplemental Restraint System - B-Pillar Side Impact Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1. Make the air bag supplemental restraint system (SRS) safe.

Refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).

2.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplementary restraints system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

Refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

3. Refer to: [B-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

4. Torque: 12 Nm

Installation

1. To install, reverse the removal procedure.
2. If a new component has been installed, configure using Jaguar approved diagnostic equipment.

Supplemental Restraint System - Clockspring

Removal and Installation

Special Tool(s)

 <p>E43628</p>	<p>211-326 Locking Tool, Clockspring</p>
---	--

Removal

• WARNINGS:

Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module.

Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment. Failure to follow this instruction may result in personal injury.

Do not set a live air bag module down with the trim cover face down. Failure to follow this instruction may result in personal injury.

After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards. Failure to follow this instruction may result in personal injury.

Never probe the connectors on the air bag module. Doing so may result in air bag deployment, which may result in personal injury. Failure to follow this instruction may result in personal injury.

Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. If damaged, replace the sensor whether or not the air bag is deployed.

To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplemental restraint system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait one minute. Failure to follow this instruction may result in personal injury.

CAUTION: Make sure the wheels are in the straight-ahead position. Failure to follow this instruction may result in damage to the component.

• NOTE: Removal steps in this procedure may contain installation details.

1. Make the SRS system safe.

Refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).

2. **CAUTIONS:**

Make sure that special tool 211-326 is installed to the clockspring.

Make sure that the road wheels are in the straight ahead position, failure to follow this instruction may result in damage to the vehicle.

Refer to: [Steering Wheel](#) (211-04 Steering Column, Removal and Installation).

3.  CAUTION: Failing to install the special tool to the clockspring may result in damage to the vehicle.

6.  CAUTION: Failing to install the special tool to the clockspring may result in damage to the vehicle.

Torque: 6 Nm

7.  CAUTION: Make sure no damage is occurred to the electrical connectors. Failure to follow this instruction may result in damage to the vehicle.

8. **8.** NOTE: Do not disassemble further if the component is removed for access only.

9. Remove the special tool from the clockspring.

Special Tool(s): [211-326](#)

10.

Installation

1. 1. CAUTIONS:

 Make sure that special tool 211-326 is installed to the clockspring.

 Make sure that the arrow on the cassette is centered and pointing vertically (**make sure that the steering wheel has remained in the 12 o'clock position and that it has not been turned by +/- 360 degrees**) prior to the steering wheel installation. On removal of the special tool, keep the clockspring cables taugted to prevent the cassette moving from the set position. Failure to follow this instruction may result in damage to the component.

 Make sure that the road wheels are in the straight ahead position, failure to follow this instruction may result in damage to the vehicle.

To install, reverse the removal procedure.

Supplemental Restraint System - Front Door Side Impact Sensor

Removal and Installation

Removal

- WARNINGS:

To avoid accidental deployment, the restraints control module backup power supply must be depleted. Wait at least one minute after disconnecting the battery ground cable(s) before commencing any repair or adjustment to the supplemental restraint system (SRS), or any component(s) adjacent to the SRS sensors. Failure to follow these instructions may result in personal injury.

Always wear safety glasses when working on an air bag equipped vehicle and when handling an air bag module. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, do not use radio key code savers when working on the supplemental restraint system. Failure to follow this instruction may result in personal injury.

To minimize the possibility of injury in the event of premature deployment, always carry a live air bag module with the bag and trim cover pointed away from the body. Failure to follow this instruction may result in personal injury.

To minimize the possibility of premature deployment, live air bag modules must only be placed on work benches which have been ground bonded and with the trim cover facing up. Failure to follow these instructions may result in personal injury.

Never probe the electrical connectors of air bag modules or any other supplemental restraint system component. Failure to follow this instruction may result in personal injury.

Painting over the driver air bag module trim cover or instrument panel could lead to deterioration of the trim cover and air bags. Do not for any reason attempt to paint discolored or damaged air bag module trim covers or instrument panel. Install a new component. Failure to follow this instruction may result in personal injury.

- NOTE: Removal steps in this procedure may contain installation details.

1. Make the air bag supplemental restraint system (SRS) safe.

Refer to: [Supplemental Restraint System \(SRS\) Health and Safety Precautions](#) (100-00 General Information, Description and Operation).

2.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any air bag supplementary restraints system (SRS) components. To deplete the backup power supply energy, disconnect the battery ground cable and wait for one minute. Failure to follow this instruction may result in personal injury.

Refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2. If a new component has been installed, configure using Jaguar approved diagnostic equipment.

Pedestrian Protection System - Pedestrian Protection System

Description and Operation

COMPONENT LOCATION

E93610

Item	Part Number	Description
1	-	right-hand (RH) hood actuator
2	-	Pedestrian protection system control module
3	-	left-hand (LH) hood actuator
4	-	LH accelerometer
5	-	RH accelerometer

OVERVIEW

The pedestrian protection system is designed to mitigate injuries in a pedestrian collision with the vehicle. It does this by utilizing a pair of pyrotechnic actuators to lift the hood away from the engine, creating a cushioned impact between the pedestrian and the vehicle.

The pedestrian protection system also includes passive protection integrated into the bumper system and bonnet structure.

WARNING: Do not fit any non-Jaguar approved accessories to the vehicle.

- NOTE: The pedestrian protection system operates independently from the supplemental restraint system (SRS).

The pedestrian protection system is operational when the vehicle is traveling at speeds between approximately 20 km/h (12.4 mph) and 45 km/h (28 mph). A vehicle speed signal is received by the pedestrian protection system control module over the high speed controller area network (CAN) bus.

The system is able to determine if contact is made with a pedestrian or another object, such as a traffic cone, using signals from accelerometers mounted behind the front bumper. When the system determines contact is made with a pedestrian it fires the actuators to lift the rear of the hood approximately 130 mm within 35 ms of the 'fire' signal.

When an impact condition is registered, the pedestrian protection system control module outputs an impact signal on the high speed CAN bus. This signal is used by the rear junction box (RJB) to initiate the hazard warning lamps. If this occurs, the hazard warning lamp switch is disabled for the remainder of the current ignition cycle.

WARNING: If any damage is caused to the front of the vehicle, be it cosmetic or structural, repairs must be carried out in line with the processes contained in the workshop manual. Failure to carry out the correct repair process could compromise operation of the pedestrian protection system. Refer to GTR for the latest information.

If the pedestrian protection system control module detects a fault with the system, it outputs a message on the high speed CAN bus to the instrument cluster message center. On receipt of this, the message center will display the message 'CHECK PEDESTRIAN SYSTEM'.

CAUTION: The vehicle must be left for 1 minute after disconnecting the battery before any work can be carried out on the pedestrian protection system.

The pedestrian protection system control module also stores the vehicle identification number (VIN). If a new control module is fitted to the vehicle the Jaguar approved diagnostic tool must be used to program the unit with the vehicles VIN.

When the vehicle is delivered from the factory the pedestrian protection system is in a 'safe' plant mode. Normal operating mode should be activated using the Jaguar approved diagnostic tool during the Pre-Delivery Inspection (PDI) prior to delivery to the customer. For additional information, refer to the PDI manual.

Hood Hinges

- NOTE: **A** = Non-deployed hinge; **B** = Deployed hinge

E95115

Item	Part Number	Description
1	-	Firing pin
2	-	Stabilizing link
3	-	Hood leaf
4	-	Intermediate leaf
5	-	Body leaf

The hinge system incorporates a number of leaves. This includes a leaf attached to the body, an intermediate leaf and a leaf attached to the hood. During normal operation the hinge opens and closes using the hood and intermediate leaves. These are attached together by a firing pin. When the actuators are fired the firing pins fail. This allows the hood and intermediate leaves to separate and deploy the hood upwards. When the hood deploys the hood latches act as temporary hinges.

- NOTE: The hinges deform during the deployment process and will need to be replaced.

Pedestrian Protection System - Pedestrian Protection System - Overview

Description and Operation

OVERVIEW

WARNING: All pyrotechnic devices are dangerous. Before performing any procedures on any pyrotechnic device, read all information contained within the [Standard Workshop Practices](#) section of this manual.
Refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).

The pedestrian protection system is designed to mitigate injuries in a pedestrian collision with the vehicle. It does this by utilizing a pair of pyrotechnic actuators to lift the hood away from the engine, creating a cushioned impact between the pedestrian and the vehicle.

The pedestrian protection system also includes passive protection integrated into the bumper system and bonnet structure.

WARNING: Do not fit any non-Jaguar approved accessories to the vehicle.

- **NOTE:** The pedestrian protection system operates independently from the [SRS \(supplemental restraint system\)](#).

Pedestrian Protection System - Pedestrian Protection System - System Operation and Component Description

Description and Operation

Control Diagram

- NOTE: A = Hardwired; D = High speed CAN (controller area network) bus; N = Medium speed CAN bus

E93611

ItemDescription

1	Battery
2	CJB (central junction box)
3	Instrument cluster
4	LH (left-hand) hood actuator
5	RH (right-hand) hood actuator
6	Pedestrian protection system control module
7	RH accelerometer
8	LH accelerometer
9	RJB (rear junction box)
10	BJB (battery junction box)

System Operation

The pedestrian protection system is operational when the vehicle is traveling at speeds between approximately 20 km/h (12.4 mph) and 45 km/h (28 mph). A vehicle speed signal is received by the pedestrian protection system control module over the high speed [CAN](#) bus.

The system is able to determine if contact is made with a pedestrian or another object, such as a traffic cone, using signals from accelerometers mounted behind the front bumper. When the system determines contact is made with a pedestrian it fires the actuators to lift the rear of the hood approximately 130 mm within 35 ms of the 'fire' signal.

When an impact condition is registered, the pedestrian protection system control module outputs an impact signal on the high speed [CAN](#) bus. This signal is used by the [RJB](#) to initiate the hazard warning lamps. If this occurs, the hazard warning lamp switch is disabled for the remainder of the current ignition cycle.

If the pedestrian protection system control module detects a fault with the system, it outputs a message on the high speed [CAN](#) bus to the instrument cluster message center. On receipt of this, the message center will display the message 'CHECK PEDESTRIAN SYSTEM'.

The pedestrian protection system control module also stores the [VIN \(vehicle identification number\)](#). If a new control module is fitted to the vehicle the Jaguar approved diagnostic tool must be used to program the unit with the vehicles [VIN](#).

When the vehicle is delivered from the factory the pedestrian protection system is in a 'safe' plant mode. Normal operating mode should be activated using the Jaguar approved diagnostic tool during the Pre-Delivery Inspection (PDI) prior to delivery to the customer. For additional information, refer to the PDI manual.

If any damage is caused to the front of the vehicle, be it cosmetic or structural, repairs must be carried out in line with the processes contained in the workshop manual. Failure to carry out the correct repair process could compromise operation of the pedestrian protection system. Refer to GTR for the latest information.

The vehicle must be left for 1 minute after disconnecting the battery before any work can be carried out on the pedestrian protection system.

Failure Mode Detection

In service, if any fault is detected, or any part of the system is recognized as not being present, the message center displays the warning 'Check Pedestrian System'.

The bonnet deployment actuators are non-serviceable components, and if they must be replaced due to a fault, or due to having been deployed, or following any other accident, their barcode labels must be read and recorded in the service database against the vehicle VIN for security purposes.

After deployment of the pedestrian protection system, the vehicle must be stopped as soon as it is safe to do so. The hazard warning lamps will be activated and can only be switched off by pressing the engine START/STOP button to turn the engine off and on again. A warning message 'CHECK PEDESTRIAN SYSTEM' will appear on the message center and the vehicle should be transported to the nearest dealer/authorised repairer. The vehicle must not be driven when the bonnet has been deployed.

• **NOTE:** If the warning message 'CHECK PEDESTRIAN SYSTEM' appears in the message center when the bonnet has not been deployed, the vehicle should be taken to the nearest dealer/authorised repairer immediately. It can be driven.

If any significant damage occurs to the front bumper it should be inspected by a dealer/authorised repairer as soon as possible.

Component Description

CONTROL MODULE

The control module is mounted below the hood release lever behind the side trim in the left hand front footwell.

The deployment signal is received from the pedestrian protection system control module. The second-generation system adopted for XF is all-new to Jaguar and, although similar, differs from that introduced on XK by having an accelerometer-based sensing system rather than a contact-sensing system. The accelerometer-based system is supplied by Bosch. Mounted very close to the skin of the bumper, it examines the characteristics of vibration waves caused by impact. Its response time is quicker, because it does not rely on the front of the bumper being loaded. It uses the 'saved' time to make more complex decisions, and so has fewer error states. The speed of vehicle and the length of the bonnet define the time available to get the bonnet into its deployed and stabilized position. It is possible, therefore, to create a time-line counting back from the predicted moment of head impact to the time when the deployment signals need to be sent. That in turn defines a time from first contact to decision time.

HOOD ACTUATORS

E73033

The hood actuators are pyrotechnic air bags. The hood actuators are located just forward of the hood latches on either side of the hood. The actuators comprise a pyrotechnic device to raise the hood, a secondary hood latch mechanism and a tether sleeve. Once fired a locking device mounted on top of the actuator couples with the secondary hood latch before the airbag inflates to raise the hood. This ensures that the hood can only deploy to a pre-determined height (approximately 130 mm). As the hood actuator is fired two prongs located in the secondary latch housing are moved out of their retaining clamp. The prongs are spring loaded to grip the secondary hood latch striker securing it to the actuator tether cone. Hood Actuator and Secondary Latch.

They are mounted to brackets in the secondary bulkhead and interface to reinforced areas on the lower surface of the bonnet.

Engine Compartment Lid

The two-piece engine compartment lid is in aluminum and the inner panel has a hexagonal panel structure, which allows energy from a pedestrian head impact to be absorbed effectively across the full area of the bonnet. It also has sufficient strength in the rear cross-beam to accept the forces from the actuators and maintain a stable condition.

When deployed, front bonnet latch acts as the pivot point and the rear hinges allow a controlled degree of upward movement before retaining the bonnet at the end of its deployment, thus limiting its total upward travel and stabilizing its position.

- NOTE: A = Non-deployed hinge; B = Deployed hinge

A**B**

E95115

ItemDescription

1	Firing pin
2	Stabilizing link
3	Engine compartment lid leaf
4	Intermediate leaf
5	Body leaf

The hinge system incorporates a number of leaves. This includes a leaf attached to the body, an intermediate leaf and a leaf attached to the hood. During normal operation the hinge opens and closes using the hood and intermediate leaves. These are attached together by a firing pin. When the actuators are fired the firing pins fail. This allows the hood and intermediate leaves to separate and deploy the hood upwards. When the hood deploys the hood latches act as temporary hinges.

- **NOTE:** The hinges deform during the deployment process and will need to be replaced.

Pedestrian Protection System - Pedestrian Protection System

Diagnosis and Testing

Principles of Operation

For a detailed description of the pedestrian protection system, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (501-20C Pedestrian Protection System)

[Pedestrian Protection System](#) (Description and Operation),
[Pedestrian Protection System](#) (Description and Operation),
[Pedestrian Protection System](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Damaged, loose, or missing fixings or components 	<ul style="list-style-type: none"> ● Ensure dummy electrical connector is installed to the Pedestrian Protection module ● Blown fuse(s) ● Damaged, loose or corroded connectors ● Wiring harness ● Damaged Pedestrian Protection module

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

• CAUTIONS:

Prior to carrying out any pinpoint tests on the pedestrian protection system the back-up power supply must be depleted. Disconnect the battery and wait two minutes for the back-up power supply to deplete.

When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).

• NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Body Repairs - General Information - Body Repairs

Description and Operation

General Information

Introduction

The body plays a significant role in the increasing trend of ever more rapidly changing model variants. The different customer groups are strongly influenced by the design and shape of the body. At the same time the stability of the body plays the most important part in ensuring passenger and driver safety. Lightweight construction, alternative materials, composite materials, plastics and appropriate joining processes are all design features that characterise modern Jaguar vehicle bodies.

In terms of manufacturing technology, modern safety cell bodies can be produced almost without any problems. Jaguar guarantee high quality standards by ensuring that mechanical strength properties are tried and tested in numerous computer simulations, crash tests, by testing materials and by employing sophisticated manufacturing technologies. In the event of repairs it is vital that the production quality standards are upheld. This requires a well-equipped workshop, and places particular emphasis on the qualifications of the workshop technicians. Up-to-date knowledge of current manufacturing technologies and continuous training on new repair methods and techniques are vital for high-quality body repairs. The model-specific repair manuals and the general repair techniques provide valuable support when undertaking body repairs.

Always follow the repair instructions published in this manual. Failure to observe this instruction can result in serious impairment of vehicle safety. All specified safety requirements must be met after the work has been carried out.

Vehicle design

The body

The XF adopts the latest generation steels, especially in the upper body – including high carbon steels, dual-phase, hot-formed boron steels, and bake-hardened steels to form a vertical safety 'ring' around the occupant cell. As well as combining strength with lightness, these steels improve corrosion resistance, by making best use of zinc and improving e-coat paint flow – and new thinking means that in spite of their strength, the XF's A and B-pillars are impressively slim, to the benefit of both visibility and accessibility. Similarly, the lower sills are the first component on any Jaguar to use incredibly strong, dual-phase DP600 steel.

The safety of the driver and the passengers is paramount for every body design. There are two key safety aspects in the body:

- Safety passenger cell
- Crumple zones

Safety passenger cell

- Stable pillars, rocker panel and door profiles.
- Side impact protection in the doors.
- Doors are designed to open even in the event of extreme deformation.

Crumple zone

- Dynamic absorption of deforming forces.
- Protection of the passenger cell.

Vehicle Design

Item	Part Number	Description
1		Bodyshell

High Strength Steels

Most modern vehicles are constructed from a number of different steels, partly to obtain an optimised body (collision, safety, rigidity, fuel economy, etc).

Steels are divided into several groups according to their tensile and yield strength, that is to say the force necessary to bring about plastic deformation of the material.

Yield Summary

Yield is the strength at which the metal changes from elastic to plastic in behaviour, the point of no return.

Tensile Summary

Tensile strength is the breaking strength of a material when subjected to a tensile (stretching) force, the point of no return.

Dual Phase (DP) steel falls into both the very high strength steel (VHSS) and extra high strength steel (EHSS) classifications, dependant on grade of DP.

Steel Type	Yield Strength
Mild steel (MS)	Maximum yield point up to 180 MPa
High strength steel (HSS)	Steel with a yield point up to 280 MPa
VHSS	Steel with a yield point up to 380 MPa
EHSS	Steel with a yield point up to 800 MPa
Ultra high strength steel (UHSS)	Steel with a yield point greater than 800 MPa

Welding Ultra High Strength Steel

UHSS requires welding equipment which can achieve the following equipment settings.

Spot Welding

Information to follow.

MIG Brazing

When mig-brazing use the following type of welder meeting the specifications shown: Fronius Trans Plus Synergic 2700 4 R/Z/AL MIG Welder, with CuSi3 (DIN 1733) 1.0mm filler wire with setting parameters 4, which is 92 Amps, Wire feed 4.6 m/min. Shielding gas L1 = pure Argon (DIN 439).

• NOTE: When installing the A-pillar outer panel, the rocker panel and B-pillar outer panel, or the roof panel, they must be slot brazed where they adjoin the A-pillar reinforcement upper.

• NOTE: The size of the slots are to be 20mm x 8mm and 30mm apart. Slots should be installed in accordance with this spacing. Where this is not possible, due to the indents in the panel, the slot should be made in the location of the original spot weld.

Rocker panel and b-pillar outer panel

E104791

Item	Description
1	Drill 2 x 8mm holes to form basis of slot
2	Mill out to form 20mm x 8mm slot
3	Slots spaced at 30mm intervals

A-pillar outer panel

E108460

Item	Description
------	-------------

Item	Description
1	Drill 2 x 8mm holes to form basis of slot
2	Mill out to form 20mm x 8mm slot
3	Slots spaced at 30mm intervals

Roof panel

E102826

Item	Description
1	Drill 2 x 8mm holes to form basis of slot
2	Mill out to form 20mm x 8mm slot
3	Slots spaced at 30mm intervals

• NOTE: Mig brazing is carried out at a temperature of 650°C to 950°C. To avoid degradation of the ultra high strength steel material properties, the temperature must be below 950°C.

Mig braze the slot(s) using a Fronius Trans Plus Synergic 2700 4 R/Z/AL MIG Welder, with CuSi3 (DIN 1733) 1.0mm filler wire with setting parameters 4, which is 92 Amps, Wire feed 4.6 m/min. Shielding gas L1 = pure Argon (DIN 439).

Dress the surface of the weld cap (brazed slot) with 60/80 grit belt sanders.

Accident damage and diagnosis

General notes

- Exact diagnosis of the extent of the damage enables proper repair planning.
- All body repairs must be carried out in accordance with the guidelines in this Body Repair Manual.
- The stability and strength properties of the body must be taken into account during body repairs. The body has exact defined deformation patterns that must not be affected by any repair work.
- For instance, the crumple zones absorb the bulk of the impact energy. If any unprofessional repair techniques or

methods are used in these areas then this can pose a fundamental threat to vehicle safety.

Hidden damage

- As well as looking at external indicators like flaked off paint, it is vital to check for hidden body damage or deformation that is not visible from the outside. Large attached parts like bumpers and inner fenders often need to be removed to allow accurate assessment of damage to underlying body parts.

Gap dimensions

Gap dimensions offer another alternative for diagnosis by visual inspection. If any changes or misaligned edges are apparent, then this usually indicates that the dimensions of the affected part are incorrect.

Changes in gap dimension

Item	Part Number	Description
1	-	Gap too wide
2	-	Gap too small

Impact effects on the body

• NOTE: Vehicle components like drive shafts and trailer attachments transfer forces. If a vehicle is subjected to a rear impact then all connected body parts and mechanical components (e.g. transmission mountings) should be thoroughly checked. Electronic components should be checked to make sure that they still operate correctly.

Furthermore it is possible to deduce the overall extent of damage from the direction and magnitude of the impact forces. This does however require extensive body-specific knowledge.

If, for instance, an impact occurs at the front left-hand side member, then the right-hand side member is usually also affected as a result of the rigid body-shell design (crossmember). Often the length of this side member will not have changed, but because of the rigid body-shell design it may have moved from its original position (often only by a very small amount). If any deviations are present this can usually be detected by checking the gap dimensions between door and fender or by checking for changes in dimension.

In the case of more severe impacts, the front part of the body cannot absorb all of the impact energy, and the passenger cell is also deformed. Here the impact energy is transferred via the side member to the A-pillar (see diagram). This results in deformations in the area of the roof and the door rocker panel.

The body reacts quite differently to side impacts where there is hardly any crumple zone. As the passenger cell is extremely stable, there are comparatively few local deformations at the site of the impact. However, the impact forces are transferred to the entire vehicle floor, which often results in so-called "banana damage", where the vehicle is bent into a banana shape.

Impact energy is transferred via the side member to the A-pillar

E128762

Item	Part Number	Description
1	-	Deformation area - roof rail
2	-	Deformation area - roof
3	-	Deformation area - door rocker panel

Body measurements

Measuring options

- Comparison measurements can also be made on the outside of the body. Depending on the damage, comparison measurements and diagonal measurements can be carried out using compass, telescopic rod, tape measure or ruler.
- **NOTE: The same reference points must be chosen on both sides when checking for changed dimensions (e.g. bores, edges, beads/swage lines etc).**

All of the important external body dimensions are listed in Tolerance Checks.

For additional information, refer to: [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

- Measurements with a measuring/straightening jig.
- A measuring/straightening jig is required for accurate measurements of the body. The measuring systems are categorised by their means of operation:
 - Mechanical measuring system.
 - Optical measuring system.

Quick and accurate measuring results can be obtained using computerised measuring systems.

A minimum of three intact measuring points on the body are required for measurements of length, width and height dimensions.

In some cases this may mean making the measuring points accessible. All of these measuring systems can be used to make body measurements, provided all the equipment is available.

Planning a repair

The following decisions have to be made before the repairs are started:

- Does the vehicle need to be put on a straightening jig, or can it be straightened by other means?
- Does the body need to be measured?
- Do aggregates like engine or axles need to be removed?
- **NOTE: It is preferable to repair body parts rather than to renew them, as this keeps the complete body-shell intact.**
 - Which body parts need to be renewed?
 - Which body parts can be repaired?

Obtaining spare parts

The availability of spare parts often determines how easily the body repairs can be carried out. The following procedure is recommended:

- Obtain all the data for the vehicle, including type, vehicle identification number, trim code, engine identification letters, initial registration etc.
- Establish all of the metal parts that need to be renewed.
- Establish all of the attached parts that need to be renewed, including small parts like rivets, clips etc.

Straightening repairs

WARNING: The use of heat when pulling to straighten body panels, (such as side members), is not recommended. Longitudinal pulling, (hot or cold), is also not recommended. A small amount of side to side pull is permissible, (cold).

When any type of pulling or straightening operation is performed it is important to observe for any movement in adjacent panels.

A panel must retain its strength and integrity, if there is any doubt the panel must be renewed.

Straightening repairs are often required to restore the body to its original shape after an accident. This can be done with:

- Alignment jigs.
- Universal straightening and measuring jigs.
- Welding jig system.

The following points must be followed to Make sure that the repairs are carried out professionally and that all the dimensions are correct after the repairs have been carried out.

- Structure:
 - The repair sequence depends on the individual repair plan (taking any necessary disassembly work into account).
 - Clean the attachment areas.
 - Anchor the vehicle free of stress on the relevant system.
 - Support the aggregates to take strain off the body.
 - Decide on at least three measuring/mounting points that are undamaged and as far apart as possible (for basic adjustment).
 - Check the dimensions of the measuring/mounting points.

- Straightening:

-
- **NOTE:** Check dimensions and gaps continuously during straightening.

A body is always straightened in the opposite direction to that of the impact. Always carry out straightening repairs with the complete body shell assembled (do not cut out any parts beforehand). Carry out the straightening work in several stages. This prevents the risk of over stretching or of welded joints tearing out. During the individual straightening steps, relieve tension by striking with an aluminium hammer while the part is subjected to a tensile load (in the area of pre-determined folding points, dents, welded joints etc.).

- Special features:

- Ultra high strength steel cannot be straightened due to its brittleness and must always be replaced.

Cutting out body parts

Depending on how the parts are joined/connected, different tools are suitable for cutting/separating body parts.

Spot-weld mill

DEE0003924

- **NOTE:** All other parts like interior equipment, window glass etc. must be protected against flying sparks.
- **NOTE:** Make sure that the milling depth is set correctly to prevent the remaining flange from being weakened.

Rod sander

DEE0003925

- NOTE: Wear protective clothing. Protect any vulnerable body or glass areas against flying sparks. Remove explosive materials from the vicinity.

Any spot welds that are inaccessible for the spot-weld mill (diameter > 8 mm) should be ground out using a rod sander. The same applies to MIG spot welds or seams.

Short stroke saw

DEE0003926

- NOTE: Underlying metal parts, wiring harnesses, hoses etc. must not be damaged - remove them beforehand if necessary.

Body saws are particularly versatile and are therefore very suitable for making severance cuts on body parts.

Reciprocating saw

DEE0003927

In addition to the short stroke saw, the reciprocating saw can be used. With this, it is possible to make narrow and straight cuts to an exact depth.

Carrying out the repairs

Butt joint

DEE0003929

- NOTE: The severance cut should always be kept as short as possible on sectional replacement. Only cut at the severance lines shown in the repair chapters.

Do not make any cuts near reinforcements or pre-determined folding lines.

- Prepare parts remaining on the vehicle/new parts.
 - Reshape the adjoining surface of any dented body parts that are to remain on the vehicle using a hammer and a counterhold (Make sure that the old part matches the shape of the new part). Grind off left over spot welds or seams with an angle grinder.
 - Cut the new parts to shape.
 - If necessary punch or drill holes for mig plug welding.
 -
- NOTE: Do not use a welding torch to remove paint residue (the heat could cause the metal to deform).

Grind all joining flanges to bare metal on both sides. Do not use an angle grinder for this purpose (this could weaken the metal and damage the zinc layer). Suitable tools: rotating wire brush, belt sander or plastic disc.

- Apply welding primer liberally to all weld flanges.
- The primer must be well stirred before use.

- NOTE: When using aerosols, take care not to contaminate adjacent parts with spray mist.

Fit the new part.

- It must be Make sured that the new part fits exactly to the specified dimensions. Suitable equipment:
 - Alignment jig.
 - Universal measuring system.
 - Jig system.
 - Ruler or tape measure.
 - Compass.
 - Frame dimensions can be found in the model-specific repair manuals.
- • NOTE: Any attached body parts that require accurate alignment and fitting must be incorporated in this step; for instance bumpers, seals, headlamps, rear lamps and lock assembly components. If this is not done carefully it may result in water leaks, wind noises and substantial follow-on work.

Make sure that edges line up with adjacent parts and check that gaps are consistent (compare left and right-hand sides). Make sure that the shape of the vehicle is retained.

Secure the new part

- • NOTE: The need for subsequent follow-on work can be significantly reduced if aligning and tack-welding are carried out with due care.

Depending on accessibility the following methods for securing are available:

- Grip pliers (set of).
- Screw clamp (set of).
- Self-tapping screws.
- Tack welds.
- Use a staking tool or a screwdriver to Make sure that the edges of sectional replacements of profiled parts line up. The edge is then tack welded to Make sure that it lines up.

Aligning and tack weld

DEE0003933

Item	Part Number	Description
1	-	Tack welds
2	-	Using a screwdriver to align

- Longer joints are usually tack welded to prevent the panel from warping. It is important to carry out the tack welds in the correct sequence (see diagram).
- Weld in the new part following the instructions in the repair manual.

Correct tack welding sequence

DEE0003934

Follow on repairs/corrosion protection

- This step basically covers the following work:
 - Grinding welded seams.
 - Priming any bare metal.
 - Sealing welded seams.
 - Applying underbody protection.
 - Sticking damping matting in place.
 - Filling cavities with cavity wax.
 -
- **NOTE:** See corrosion protection section for cavity wax application areas.

Cavity wax (after painting).

Panel Beating

Fundamentals of panel beating

- Before carrying out any sectional replacements or complete replacements of body panels, always check carefully whether the damaged panel(s) can be rectified by panel beating.
- Panel beating is usually the easiest and most economical method of repairing a damaged panel.

Examples of applications of different panel beating techniques:

- Aluminium hammer and mallet.
 - Advantage: Low risk of over-stretching the panel.
 - Used for repairs of small dents on panels that are accessible from both sides.
 - These two panel beating tools are usually used for "finishing repairs".

Fine straightening with an aluminium hammer and a universal dolly

DEE0003935

- Sliding hammer
 - If the damaged panel is only accessible from the outside, use a sliding hammer to pull it back into shape. The discs or studs needed to mount the sliding hammer are welded onto the bare surface. Dents in the panel can be flattened out using controlled application of the sliding hammer.

Heat-treatment of panels

- It is usually inevitable that some parts of the body panels show excess material as a result of mechanical strain. If there are any areas of excess material this will cause localised instabilities due to differences in tension. These localised instabilities can be stabilised by applying heat-treatment techniques.
- • NOTE: This does not apply to high-strength low alloy steel, ultra high strength steel and aluminium.

Rule: Flattening panels by heat-treatment reduces the amount of excess material by more than they were originally stretched.

Different heat-treatment techniques.

- NOTE: Different heat-treatment techniques are used depending on the amount of excess material.

- Flattening using a flame.
 - A welding torch is used if the material excess extends over a larger area (torch size 0.5 - 1.0 mm). Use a soft flame.
 - The surface of the metal is briefly spot-heated and then immediately cooled with a wet sponge.
 - Requirement: Ability to handle a welding torch safely and knowledge of annealing colours of steel.
 - Advantage: No damage to the surface of the metal.
- Flattening using a flame, supported by hammer and counterhold.
 -
 - NOTE: The flattening effect is increased by speeding up the heating and cooling stages.

If the material excess is concentrated, then the flattening effect can be increased after heating by carefully using an aluminium or wooden hammer.

- Requirement: Ability to recognise material tension by feeling the surface that is to be flattened.
- Flattening using a carbon electrode.
 - If panel areas are only accessible from one side, or the panel is only slightly destabilised, then the preferred method is flattening using a carbon electrode.
 - Requirement: Bare metal surface.
 - Disadvantage: Scarring and hardening of the surface.
- Flattening using a copper electrode.
 - Small, sharp dents that face outwards can be worked on with a copper electrode.
- Flattening using a flame and body files.
 -
 - NOTE: When applied correctly, this method can be used with all the attached parts still in place (roof headlining, wiring harnesses etc.).

Small, soft dents (only slight stretching): Working at the edges of the dent in an inward spiral pattern, the dent is heated with an oxyacetylene torch (torch size 1 - 2 mm, excess gas flame) to approx. 250° C.

- Working rapidly with a body file extracts heat from the edge area until the dent is flattened. Preferably alternate between two files. This increases the amount of heat that can be extracted.

Safety measures

- The electronic control modules (ECM) fitted to vehicles make it advisable to follow suitable precautions prior to carrying out welding repair operations. Harsh conditions of heat and vibration may be generated during these operations which could cause damage to the modules. In particular, it is essential to follow the appropriate precautions when disconnecting or removing the airbag RCM.
- Do not allow electronic modules or lines to come into contact with the ground connection or the welding electrode.
- Seat belt anchorages are a safety critical. When making repairs in these areas, it is essential to follow design specifications. Note that extra strength low alloy steel may be used for seat belt anchorages. Where possible, the original production assembly should be used, complete with its seat belt anchorages, or the cut line should be so arranged that the original seat belt anchorage is not disturbed.
- All welds within 250mm (9.842) of seat belt anchorages must be carefully checked for weld quality, including spacing of spot welds.
- Remove the battery before carrying out welding work in its vicinity.
- Utmost care must be taken when welding near the fuel tank or other components that contain fuel. If the tank filler neck or a fuel line must be detached to allow access for welding work, then the fuel tank must be drained and removed.
- Never weld, on components of a filled air conditioning system. The same applies if there is a risk of the air conditioning system heating up.

- Connect the ground connection of the electrical welder directly to the part that is to be welded. Make sure that there are no electrically insulating parts between the ground connection and the welding point.
- Adjacent vehicle parts and adjacent vehicles must be shielded against flying sparks and heat.

Pedestrian protection system

The pedestrian protection system is designed to mitigate injuries in a pedestrian collision with the vehicle. It does this by utilizing a pair of pyrotechnic actuators to lift the hood away from the engine, creating a cushioned impact between the pedestrian and the vehicle. It is essential that any repair or replacement operations do not affect the safe working of the system.

For additional information, refer to: [Pedestrian Protection System](#) (501-20C Pedestrian Protection System, Description and Operation).

Resistance spot welding

Where resistance spot welds have been used in production, they must be reproduced with new spot welds in replacement where possible. All such reproduction spot welds should be spaced 25 to 30mm apart.

Setting up the equipment and co-ordinating the welding parameters.

- Equipment:
 - Follow the equipment manufacturer's instructions for the equipment settings.
 - Select the correct electrode arms (as short as possible).
 - Align the electrode arms and tips exactly.
 - Electrode tips should be convex (rough shaping with a file, fine shaping with a sanding block).
- Body:
 - Make sure that the flanges to be joined lie perfectly flat to one another.
 - Prepare a bare metal joint surface (inside and outside).
- Notes on technique/method:
 - Carry out a test weld on a sample piece of the material coated in welding paste.
 - If any metal parts are located between the electrode arms then there will be a loss of induction and therefore power (adjust current setting).
 - The power needs to be adjusted for high-strength low alloy steel.
 - Repeated welding on old welding points often leads to poor quality welds.
 - Keep the electrode tips as near as possible to an angle of 90° to the contact surface.
 - Keep the pressure on the electrodes for a short period after finishing the weld.
 - The electrodes work best if their shape is convex. Clean the contact surface of the electrodes regularly.

Resistance spot welding panels where the total thickness is 3 mm or more

For all repairs to modern Jaguar vehicles, spot-welding equipment should be suitable for reliable welding of zinc-plated, high-strength and high-tensile steels in three or more layers, up to 5 mm total thickness. If these requirements are not fulfilled, plug welding must be used for safety reasons. The electrical specifications (current, resistance, heat) of the spot-welding equipment have different validity, depending upon the type of equipment. Therefore, it is essential that the manufacturer's instructions are observed with regard to the actual welding performance.

MIG/MAG welding

Setting up the equipment and co-ordinating the welding parameters.

- Any joints that are MIG/MAG welded in production must also be MIG/MAG welded during repairs. Also during repairs, some resistance spot welds need to be replaced by plug welds.
- If access is difficult, or if a suitably powerful spot welder (see above) for total panel thicknesses of 3 mm or more is not available, resistance spot welding must be partially replaced by plug welding during repairs. In this case, the increased time needed and the correspondingly more demanding corrosion protection requirements, must be taken into account.
- Welding repairs can only be carried out properly if the equipment is set up correctly and all the welding parameters are co-ordinated.
- Equipment:
 - Set up the equipment as directed by the manufacturer.
 - The hoses must be untwisted.
 - The core must be free of abraded rod particles.
 - The gas and current nozzles must be free of slag and scale residue.
 - Pay attention to the quality of the welding rod and the throughput of gas.
- Body:
 - Make sure that the joint surface is perfect.
 - Prepare a bare metal joint surface.
 - Maintain the correct gaps (formation of roots).
- Notes on technique/method:
 -
 - NOTE: The increased application of heat during MIG welding destroys the welding primer/zinc layer over a much larger area than during resistance spot welding, as a result of which much more care needs to be taken when applying anti-corrosion protection afterwards.
 - NOTE: A test weld should always be carried out to make sure that the welded joint is not just a surface connection.

Attach the ground cable right next to the welding point (Make sure that good contact is made).

- During plug welding start welding on the lower panel to Make sure adequate penetration.

Plug welding

DEE0003936

Item	Part Number	Description
1	-	Welding direction: circular pattern working from the inside outwards
2	-	Welding starting point: centre of hole on lower panel

Bonded glazing

- - The windscreen, side and rear windows are bonded directly onto the window frames on the body and liftgate.
- The windows are bonded primarily for reasons of adhesive strength. Bonded glazing provides additional torsional stiffness to the body.

Adhesive bonding of bonded windows

DEE0003938

Item	Part Number	Description
1	-	Rubber strip
2	-	Window frame
3	-	Adhesive
4	-	Window glass

Removing and installing bonded windows

Safety measures

- The following safety measures must always be followed to prevent personal injury:
 - Wear protective gloves and arm protection.
 - Wear protective goggles.

Preparations

- Before cutting out a bonded window, undo and remove any attached parts in the cutting area that are at risk, e.g. trim panels and decorative strips, as well as all electrical connections.
- Mask any painted areas that are adjacent to the window.
- Cut off any surplus adhesive, as this makes it easier to cut out the window.
- Secure vertical windows against dropping out.

Cutting out the window

- Cut into the adhesive bead at easily accessible points using the cutting tool.
- Carefully guide the cutting tool around the window, cutting through the adhesive bead.
- Avoid touching the window frame and the body flange.
- Use cup suction tools to lift the cut-out window out of the window aperture.

General preparations for bonding

- Follow the manufacturer's instructions.
- Cut back the remaining adhesive bead on the metal flange to a residual height of about 1mm. Do not touch or clean the cut surface afterwards.
- Carefully rectify any paint damage (apply primer and top coat).
- Renew the window stops as necessary.

Bonding the window glass

- Apply an even bead of adhesive to the window or to the body flange.
- Insert the window glass into the window aperture and centre it (2 technicians required).
- Check the gaps.
- • NOTE: Open the windows and doors while the window is left to dry and do not move the vehicle (slamming doors creates excess pressure which could cause the window to become loose).

Use adhesive tape to prevent the window from falling out or slipping.

Finishing operations

- Reconnect all electrical connections and check that the components operate correctly.
- Install the attached parts and check that the fit is accurate and secure.
 - Carry out a visual inspection to Make sure that the gaps and joints are even.
- Thoroughly clean the window glass.

Protective equipment and safety at work

- Various safety measures and legal requirements must be met when carrying out repairs. All regulations relating to health and safety at work must be followed.

Welding safety precautions

- The following safety precautions must be observed to prevent the risk of personal injury:
 - Protective overalls
 - Safety hood (face protection).
 - Welding shield.
 - Safety gloves.
 - Safety shoes.
 - Extraction unit for welding fumes.
- Welding should always be carried out in well ventilated areas. A fire extinguisher must also always be within reach.

General body repair safety measures

Extraction unit

DEE0003940

- Sealing compound, underbody protection etc. must not be burned off with a naked flame. This would produce toxic gases. If for instance PVC is burned, then gases containing hydrochloric acid are produced. For this reason a suitable extraction unit should always be used when performing grinding, welding or soldering work.
- Always Make sure good ventilation when working with materials that contain solvents, wear breathing equipment and use an extraction unit.
- Ear defenders should always be worn when cutting, grinding or straightening metal, as the noise levels can reach or even exceed 85 - 90 dB(A).
- Take care not to look directly into any laser measuring systems, for instance used to measure the under body.
- When removing components from a vehicle mounted on a lifting ramp, watch out for a shift in its centre-of-gravity. When first placing the vehicle on the ramp, take into account that it may need to be secured against tipping over.
- Chains and chain clamps must be secured with safety ropes during straightening work.

Safety rope

DEE0003941

Body Repairs - Corrosion Protection - Corrosion Protection

Description and Operation

General

The corrosion protection provided in production must be carefully maintained and/or reproduced during and after body repair work. It is only then that the long-term warranty against penetrative corrosion damage can be assured.

Only Jaguar original bodywork components and Jaguar approved repair materials, (sealer, paint etc.), are to be used for bodywork repairs.

Jaguar Original Parts

E117239

All Jaguar bodywork components have a cathodic base coating. Individual bodywork components are zinc plated on one or both sides, (in different areas depending on vehicle model).

Together with elastic paint coating, this guarantees an optimum, highly resistant protection against corrosion caused by the impact of small objects such as gravel.

• **NOTE:** If possible, the individual protective layers, (zinc, cathodic base coat), on Jaguar bodywork components must not be damaged or destroyed by sanding or other mechanical operations.

If hairline cracks at "bodywork connection areas" appear after reshaping work, (e.g. at door hinges), it must be ensured that the corrosion protection provided in production is recreated. The complete paint covering must be re-created if necessary. The same applies to reshaping work on heavily profiled bodywork components, (e.g. floor pan). Renew or touch-up the paint coating, sealing beads and underbody protection as necessary.

After repair, any interior surfaces which are no longer visible or accessible must be primed before cavity wax is applied. To be certain of an even coating on inner surfaces, careful application of spray, (twice, with drying time in-between), must be carried out throughout the whole cavity.

If bodywork panels are strongly heated during repair work, this will invariably result in damage to or even destruction of the applied corrosion protection material. The effectiveness of the cavity protection material is reduced if heating occurs. Reworking of the affected areas is therefore vital.

Welded areas should be made good before corrosion protection is applied.

The corrosion protection measures to be taken when bodywork components are renewed are described on the following pages.

Corrosion Protection of New Components

All new components must be inspected for transport or storage damage such as scratches or dents. The following operations may be necessary, depending on the extent of damage:

Undamaged New Component

- Do not grind the cathodic primer.
- Thoroughly clean with silicone remover and rub dry.

Slightly Damaged New Component

- Sand out scratches.
- Finely sand the surrounding surface.
- Thoroughly clean with silicone remover and rub dry.
- Apply corrosion protection primer to bare areas.

Damaged New Components (bumps and dents)

- Beat out the dented area and sand down to bare metal.
- Apply polyester filler (only onto bare metal).
- Apply filler.
- Lightly sand the whole component.
- Thoroughly clean with silicone remover and rub dry.
- Apply corrosion protection primer to bare areas.

The clinched flanges on the hood, doors, tailgate and liftgate must be sealed with clinched flange sealer, if this is not already applied.

Weld Components

Use a stripping disc to remove the cathodic primer on the inside and outside of the area to be welded. The stripped area should be kept as small as possible, retaining as much of the cathodic primer as possible, taking care not to damage the zinc coating.

Apply Welding Primer

- NOTE: The welding primer must be stirred well or shaken before application.

Clean the repair area thoroughly, (silicone remover).

Apply welding primer evenly to all weld flanges, (old and new components).

- NOTE: The welding primer must be allowed to dry before welding is carried out.

All weld beads must be ground down after all welding is completed, taking care not to weaken the material.

Any unevenness at the joint must be made good.

If necessary, spot weld missing weld studs into position.

The vehicle must be completely cleaned of sanding dust and metal swarf because of the danger of corrosion.

Clean and prime all internal areas and those to be sealed.

- NOTE: The primer must be dry before sealing mastic or underbody protection is applied. Do not use thinners when applying sealing mastic, (the mastic will not dry).

Partial Renewal

The procedure to follow when partially renewing components is the same as described in the section "Welded Components".

The main difference when components are partially, rather than completely renewed, concerns the preparation of butt or lap joints.

- When bodywork components are cut through, attention must be paid to the adequate removal of the paint and zinc coatings on inner areas. This specially applies to areas which are difficult to access internally.
- It is important for the weld quality that the inner area is bare metal. Zinc and paint residues in the weld area burn and cause serious hole formation during welding.
- If the zinc layer and the paint coating are not removed, the zinc and paint will burn during welding. The soot produced prevents satisfactory cavity protection.

Procedure

- The paint layer must be removed for a width of 30 mm from the line of the weld using a rotating tress wire brush.
- This operation must be carried out on both the new and the old parts of the bodywork.
- Depending on the bodywork component, a 10 mm width of the underlying zinc layer must also be removed along the weld line.

- NOTE: A flat scraper or a wire brush can be used instead of the rotating brush if the cavity is small. Do not use an angle grinder, which would weaken the structure.

Underbody sealer

Under floor areas and the front part of the spare wheel well are treated with a plastisol PVC underbody sealer. This material is not suitable for re-treatment. When repairing areas of underbody sealer, strip the factory-applied underbody sealer back to a suitable break point. Ensure that a clean metal surface is exposed and that the edge of the existing adheres soundly to the panel.

Apply new underbody sealer between primer and surface paint operations. Apply seam sealer as necessary before application of underbody sealer. Ensure that blanking plugs and grommets in the floor pan (except those used for wax injection) are fitted before underbody sealer application. Refit any heat-fusible plugs which have been disturbed in repair with the aid of a hot air blower, or replace with rubber grommets

CAUTION: Ensure that suspension units, wheels, tires, power unit, drive shafts, exhaust and brakes, (including all mounting points), are shielded prior to application of fresh underbody sealer.

Area of Underbody Sealer Application - Floor Pan (Front)

Area of Underbody Sealer Application - Spare Wheel Well and Rear Side Member

Precautions During Body Repairs and Handling

Take care when handling the vehicle in the workshop. Underbody sealers, seam sealers, underbody wax and body panels may be damaged if the vehicle is carelessly lifted.

Proprietary Anti-corrosion Treatments

The application of proprietary anti corrosion treatments in addition to the factory-applied treatment could invalidate the corrosion warranty and should be discouraged. This does not apply to approved, compatible, preservative waxes which may be applied on top of existing coatings.

Fitting Approved Accessories

When fitting accessories ensure that the vehicle corrosion protection is not affected, either by breaking the protective coating or by introducing a moisture trap.

Do not screw self-tapping screws directly into body panels. Fit suitable plastic inserts to the panel beforehand. Always ensure that the edges of holes drilled into panels, chassis members and other body parts are protected with a suitable zinc rich or acid etch primer, and follow with a protective wax coating brushed onto the surrounding area.

Do not attach painted metal surfaces of any accessory directly to the vehicle's bodywork unless suitably protected. Where metal surfaces are bolted together always interpose a suitable interface material such as weldable zinc rich primer, extruded strip, or zinc tape.

Steam Cleaning

Due to the high pressure/temperature generated by steam cleaning equipment, there is a risk that certain adhesives and corrosion prevention material may become softened or liquified.

Take care not to allow the steam jet to dwell on one area, and keep the nozzle at least 300mm from the panel surface.

CAUTION: Do not remove wax or lacquer from underbody areas during repairs.

Inspection During Maintenance Servicing

It is a requirement of the corrosion warranty that the vehicle is inspected for corrosion by a Jaguar Authorised Repairer during a routine service, to ensure that the factory-applied protection remains effective.

Rectify any bodywork damage or evidence of corrosion found during inspection as soon as is practicable, both to minimise the extent of the damage and to ensure the long term effectiveness of the factory-applied corrosion prevention treatment.

Underbody Protection Repairs

Whenever body repairs have been carried out, ensure that full sealing and corrosion protection treatments are reinstated. This applies both to the damaged areas and also to areas where protection has been indirectly impaired, as a result either of accident damage or repair operations.

Remove corrosion protection from the damaged areas before straightening or panel beating. This applies in particular to panels coated with wax, PVC underbody sealer, sound deadening pads etc.

CAUTION: Do not use oxy-acetylene to remove corrosion prevention material. Large volumes of fumes and gases are liberated by these materials when they burn.

The most common method of removal is by means of a hot air blower with an integral scraper. High temperatures can be generated with this equipment which may cause fumes. Take care during its use.

Structural Adhesive

CAUTION: When separating a joint with metal to metal adhesive, it is important to avoid distortion. Heat gradually until the bond weakens sufficiently to permit panel separation - do not apply excessive heat.

- **NOTE:** When spot welding through metal to metal adhesive, take particular care to adjust the equipment setting to ensure a suitable weld.

Metal to metal adhesive is applied to critical joint areas during factory assembly. The material used is a high temperature, heat cured, nitrile phenolic which serves to bond two metal surfaces and also to seal the joint against ingress of dust, moisture and fumes. This material is not suitable for service use and, during repair, should be substituted by an approved structural adhesive. For panel specific information and to identify the areas of structural adhesive application in repair, refer to the relevant sheet metal removal and installation procedure.

Expanding Foam Acoustic Seals

Expanding foam acoustic seals are used in various closed-sections of the body to improve vehicle refinement. The seals are installed during the vehicle body manufacture and expand during the paint process up to ten times original size, thus locking them into position. They are located such that they prevent noise accentuation along a section and reflect air borne noise away from the cabin.

The seals have spilt functionality depending on location. The seals located at the base of the body pillars have a primary function of preventing water ingress when wading. Their secondary function is to prevent noise and dust ingress.

The seal around the fuel filler has a primary function of preventing both fuel and water ingress. With a secondary function of preventing noise and dust ingress.

The remaining seals primary function is to prevent noise accentuation along a section and reflect air borne noise away from the cabin.

Another advantage of the seals is that they marginally increase the overall stiffness of the body and its structural performance in case of a crash.

The seals are manufactured from an expandible polymer.

Replacing Expanding Foam Acoustic Seals

As paint oven temperatures used in a repair workshop are significantly lower than those that are used during manufacture of the vehicle, (the temperatures are not sufficient to expand the foam), a different process is required to replicate the foam in repair.

If a repair disturbs the expanding foam acoustic seal it must be reinstated. If access allows, (whether a new seal is fitted or the original is reused), acoustic foam should be injected after paint refinishing. If access is not possible, or it is not practical to apply expanding foam due to the nature of the repair, a suitable flexible PU sealer should be applied around the seal and the corresponding body panel/s prior to assembly. In all cases the application of foam / sealer should form a seal between the expanding foam acoustic seal and any adjacent panelwork.

E115031

Seam Sealer

A heat cured, PVC based sealant is applied to specific joint seams during factory assembly. This material is not suitable for service use and during repair and should be substituted by an approved seam sealer.

• **NOTE:** Where seams are inaccessible following the reassembly or fitting of components, ensure that a paste-type seam sealer is applied to such seams. Certain seams also become inaccessible after the completion of panel repairs. In such instances apply seam sealer and paint before final assembly.

Apply seam sealers after the application of primer and before the application of top coat. The sealer must form a continuous bead, with the profile of the bead dependent on the type of seam. If the seam sealer is applied with a brush take particular care to maintain the required coverage of the seam.

Ensure that all accessible repair seams are sealed following a repair. Damage to a vehicle often flexes areas of the body remote from the impact. As a result the seam sealer in these areas may be disturbed by subsequent straightening and repair operations. Check all seams in the vicinity of the area undergoing repair for evidence of cracked seam sealer, then clean out as required and apply fresh seam sealer using the following procedure:

- Clean the affected seam and re-treat any exposed metal areas with a suitable etch phosphate primer.
- Treat affected area with an etch-acid primer.
- Apply appropriate seam sealer as necessary.
- apply appropriate colour coat (and under body sealer as applicable).

Provided access is adequate, apply seam sealer to both sides of a repair joint. Where access is limited to one side only, (e.g. box section), treat the affected box member with cavity wax.

Cavity Wax

After repairs, always re-treat these areas with an approved cavity wax. In addition, treat all interior surfaces which have been disturbed during repairs whether they have been treated in production or not. This includes all box members, cavities and door interiors.

Before wax injection, ensure that the cavity to be treated is free from any contamination or foreign matter. Where necessary, clear out any debris.

Ensure that cavity wax is applied after the final paint process and before refitting any trim components.

During application ensure that the wax covers all flanges and seam areas and that it is adequately applied to all repaired areas of both new and existing panels.

It should be noted that new panel assemblies and complete body shells are supplied without wax injection treatment. Ensure that such treatment is carried out after repairs.

Effective cavity wax protection is vital. Always observe the following points:

- Complete all paint refinish operations before wax application.
- Check the spray pattern of injection equipment.
- Mask all areas not to be waxed.
- Remove body fixings, such as seat belt retractors, if contamination is at all likely.
- Move door glasses to fully closed position before treating door interiors.
- Treat body areas normally covered by trim before refitting items.
- Check that body and door drain holes are clear after the protective wax has dried.
- Keep all equipment clean, especially wax injection nozzles.

Body Repairs - Water Leaks - Water Leaks

Description and Operation

General

- If water leaks occur after bodywork repairs, the cause can be established using the checks described below. A systematic and logical procedure is required to locate water leaks. Before beginning extensive checks, a thorough visual inspection must be carried out.
- Visual Inspection
 - The following characteristics may indicate existing leaks:
 - Check the clearance and accurate fit of ancillary components such as the hood, tailgate, liftgate, doors, and so on.
 - Check for correct fit and possible damage to sealing elements such as blanking plugs, rubber door seals, and so on.
 - Check water drain holes for unhindered flow.
- Various tests can be used to provide further information on possible leaks:
 - Water test
 - Washer test
 - Road test
 - Chalk (powder) test

Practical execution of tests and checks

Water test

- **NOTE:** Never aim a jet of water directly at a rubber seal.
- Carry out the water test with a second person present (in the passenger compartment).
- Use variable washer nozzles (concentrated water jet to fine spray mist).
- Start in the lower section and spray the whole area, working upwards in stages.

Washer test

- Further tests can be carried out in the washer system.
- Some leaks originate here, or only occur here.
- The relevant passenger compartment should be checked using a torch during the wash procedure.

Road test

- If no leaks are located during the tests above, road tests should be carried out on wet roads.
- Road tests under various conditions:
 - At various speeds.
 - On various road surfaces (asphalt to cobbles).
 - With loaded or unloaded vehicle.
 - Driving through puddles (splash water).

Chalk test (powder test)

- In this test, the clamping load and the bearing surface of the seal are checked.
- Performing the test:
 - Dust the door seal with powder or coat with chalk.
 - Coat the bearing surface of the seal with a thin film of Vaseline.
 - Slowly close the door and open it again.
 - Check the width and continuity of the imprint on the door seal.

Other test equipment

- Other equipment such as stethoscopes, UV lamps, special mirrors or ultrasound measuring instruments can be used to locate leaks.

Rectifying the leak using recommended tools, auxiliary equipment and materials

- Tools and auxiliary equipment:
 - Dry, absorbent cloths
 - Variable washer nozzle
 - Torch, fluorescent tube
 - Mirror
 - Compressed air
 - Seal lip installer
 - Wet/dry vacuum cleaner
 - Sealing compound compressor
 - Remover for interior trim
 - Cutter blade or pocket knife
 - Wedge (wood or plastic)
 - Hot air blower
 - Special mirror for concealed leaks
 - Air flow checker
 - Sealing compound (tape and plastic compound)
 - Multi-purpose sticker
 - Clinched flange sealer
 - Window sealing compound
 - Water shield (PVC)
 - Double-sided adhesive tape for water shield

- Methylated spirit (available from trade outlets)
- PU adhesive
- Silicone remover
- Tar remover

Water leaks according to mileage or running time

Increasing mileage has an effect on the problem of leaks in a vehicle. Possible influencing factors are:

- Servicing and maintenance of seals:
 - No maintenance, lack of maintenance or incorrect maintenance
 - Using an incorrect agent
- Damaged seals:
 - As a result of aging, wear or incorrect handling/assembly.
- Heavy soiling of the vehicle:
 - Heavy soiling of a vehicle can seriously impair the function of water drainage channels in particular, and also of rubber seals.
- Age-related factors:
 - Environmental factors
 - UV radiation
 - Extreme climatic conditions
- Corrosion can have a serious impact on bodywork, in particular as a result of:
 - Lightly or heavily rusted seal carriers
 - Rusted body seal welds
 - Perforation corrosion

Water leaks after body repairs

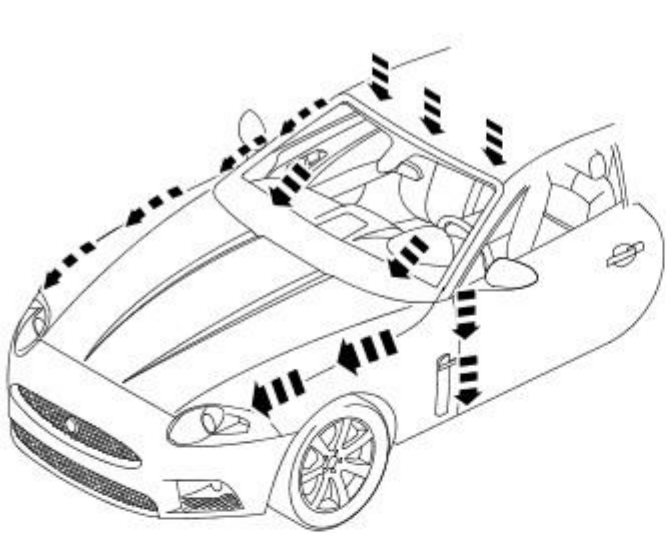

If a vehicle develops a leak after body repairs, the following points must be taken into consideration in particular:

- The correct seating of ancillary components and their seals must be checked.
- The correct alignment of doors/tailgate and liftgate must be checked. The associated seals must not be damaged and must be installed correctly.
- Check that panel seams are correctly sealed.
- The correct seating of rubber grommets must be checked.
- Directly-glazed windows must have correct and complete bonding.

Water drainage system

If a vehicle develops water leaks, then areas into which water is routed or drained should be checked first.

Water drainage system (illustration for reference only)

E102719

Item	Part Number	Description
1	-	Water drainage, front
2	-	Water drainage, side and rear
3	-	Roof drainage
4	-	Engine compartment drainage

Water leaks, diagnosis and corrective action: Front passenger compartment

Windscreen

- Diagnosis:
 - Ingress of water into A-pillar area or instrument cluster area and rocker panel area.
- Cause:
 - Breaks in adhesive beads
- Corrective action:
 - The breaks in adhesive beads can be located from inside by using compressed air. The leak can be identified from outside by the escaping air.
 - The second test method is by means of a water test. The outer trims must be raised carefully using a plastic wedge. The leak should be located from inside by a second assistant.

Side windows

In the case of side windows, the same problems can arise as for a windscreen. The same corrective actions must therefore be used.

Door seal

- Diagnosis:
 - Water ingress in the lower part of the interior door trim or in the rocker panel area.

- Cause:
 - The water shield fitted behind the interior door trim exists to drain off water that has entered the door via the drainage holes, either downwards or outwards. If the water shield seal is damaged or has been fitted incorrectly, then water can get into the passenger compartment.
 - In addition to this, the drainage holes can become clogged with leaves, dirt or excess cavity protection agents. Water gathers in the door and ingresses into the passenger compartment.
 - Check water shield for damage or correct fitting.
 - If the water shield needs to be re-bonded, then approved seam sealer should be used.
 - Before the water shield is installed, the drainage holes must be checked for unhindered flow.

Door seals

- Diagnosis:
 - Ingress of water into the rocker panel area
- Cause:
 - Insufficient clamping load between seal and door.
- Corrective action:
 - Check clamping load:
 - The easiest way to check the clamping load of a seal to the respective bearing surface is by means of a paper strip test. This consists of trapping strips of paper at various points between the door and the seal, and fully closing the door. If it is possible to pull out the paper with no great resistance, then the clamping load is too low.
 -
 - NOTE: When adjusting the clamping load, the profile alignment of the relevant components must always be taken into consideration.

Adjust the clamping load:

- The clamping load is normally adjusted using the striker. When doing so, the edge alignment from the door to the side panel, or from the front door to the rear door must be taken into account.
- Another setting method is to realign the panel flange for the seal mounting. The clamping load is increased by moving the flange towards the door.
-
- NOTE: Do not realign the flange too far in the direction of the door, as this can reduce the bearing surface of the seal to the door.

Check the bearing surface:

- Apply chalk evenly to the surface of the seal. Evenly coat the bearing surface of the door with Vaseline.
- Close the door fully, the lock must engage. Open the door. The imprint of the chalk (bearing surface) can be identified in the film of Vaseline.
- The bearing surface should be at least 5mm across at all points.

- Other causes:
 - The door seal must completely seal the door where it meets the bodywork.
 - Water can ingress directly or indirectly into the interior of the vehicle if the seal is damaged at any point.
- Corrective action:
 - A damaged or worn door seal must always be renewed in full.
 - When renewing the seal, the following must be taken into account:
 - Always fit the seal first in the area of the narrow radii (corner points).
 - Next, secure the seal to the flange evenly by tapping lightly with a rubber hammer. The installed seal must not be kinked at any point.

• NOTE: The prescribed length of a seal must not be shortened.

- Other cause:
 - The door seal is attached to the welded flange all the way round. If this welded flange is uneven or damaged at any point (usually in areas with small radii) then this point could be subject to leaks.
 - A stretched seal carrier can also cause a leak.
 - In both cases, water gets into the vehicle interior under the seal carrier.
- Corrective action:
 - Align the deformed welded flange using a hammer and anvil block, prevent and, if necessary, repair any paint damage.

Sliding roof/tilting roof

- Diagnosis:
 - Ingress of water at sliding roof aperture
- Cause:
 - The sliding roof/tilting roof is installed in a water trap. The water drains off via the water trap, water drain holes and drain hoses. The drain hoses lead downwards on both sides via the A-pillar and B-pillar.
 - The drain holes or drain hoses can become clogged with leaves, dirt, underbody protection and so on.
- Corrective action:
 -
 - NOTE: In the case of a sliding or tilting roof, the external rubber seal and the lock actuator or latch mechanism must be checked first of all.

Check the water trap for leaks.

- Check the drain hoses for leaks and for correct connection to the water trap.
- Check the drainage system for unhindered flow, and blow out with compressed air if necessary.
- Check the external seal and the correct adjustment of the sliding roof.

Liftgate

- Diagnosis:
 - Ingress of water into rear headlining area and luggage area.
- Cause:
 - The leak problems of the tailgate and liftgate correspond to those of the doors.

- In addition to this, the area to be sealed is much bigger. The routing holes for cables and hoses must also be sealed.
- The rubber grommets for the routing holes must be checked for damage and correct seating (fully unhooked).
- The mounting points of the liftgate hinges may leak.
- Corrective action:
 - Check the rubber grommets and renew if necessary.
 - Check the hinge mounting points, and re-seal with sealing compound if necessary.

Forced air extraction

- Diagnosis:
 - Ingress of water into side luggage compartment area
- Cause:
 - The forced air extraction for the vehicle interior is located in the quarter panel lower extension.
 - The rubber flap of the forced air extraction must be able to move freely.
- Corrective action:
 - Remove the forced air extraction.
 - Check the seal area between the bodywork and housing, as well as the rubber flap.
 - Renew seal if necessary.

Rear window

- Diagnosis:
 - Ingress of water into the luggage compartment area
- Cause:
 - Rear window leaking.
 - Check for leak in the same way as for leaking windscreen.

Body Repairs - Vehicle Specific Information and Tolerance Checks - Body and Frame

Description and Operation

Front End Body Dimensions

- NOTE: All dimensions shown are in millimetres (mm).
- NOTE: Dimensions shown to holes, are always taken from/to the hole centre. They are also always to the body panel surface, not to the top of bolts or components.

Front End Sheet Metal Repairs - Fender Apron Closing Panel Front Section

Removal and Installation

Removal

1. NOTE: The fender apron closing panel front section is manufactured from mild steel.

The fender apron closing panel front section is cut from the fender apron panel closing service panel.

E 107765

2. The fender apron closing panel front section is replaced in conjunction with:

- Front bumper cover
- Hood
- Front fender
- Hood latch panel
- Fender apron panel front extension
- Fender apron panel front section

3. For additional information relating to this repair procedure please see the following:

For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) /

[Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) /

[Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) /

[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

4. Remove the fender apron panel front section.

For additional information, refer to: [Fender Apron Panel Front Section](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).

5. Disconnect the generator electrical connectors.

6. NOTE: Make sure the section is cut to cater for the extent of damage and to allow a minimum 50mm staggered joint with the fender apron panel front section.

E 107766

Cut the front section from the fender apron panel closing service panel.

7.  CAUTION: Care should be taken not to cut through into adjacent panels.

Using the new panel for reference and allowing for an overlap, cut the old panel at the points indicated.

8. NOTE: To avoid unnecessary MAG plug welding on installation, spot welds must be drilled from underneath where this is possible.

Drill out the spot welds.

9. Separate the joints and remove the old panel.

Installation

1.  CAUTION: Care should be taken not to cut through into adjacent panels.

Offer up, align and clamp the new panel into position, overlapping the old panel remnant. Cut through the new panel, partially cutting the old panel, at the points where the MAG butt joint is to be made.

2. Remove the new panel.
3. Cut and remove the old panel remnants.
4. Prepare the old and new panel joint surfaces.
5. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
6. Tack weld the butt joint.

7. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original.

Spot weld.

8. Dress the tack welds.

9. MAG weld the butt joint.

10. Dress all welded joints.

11. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Fender Apron Panel

Removal and Installation

Removal

1. NOTE: The fender apron panel is manufactured from mild steel.

The fender apron panel is serviced as a separate weld-on panel.

E 107734

2. The fender apron panel is replaced in conjunction with:

- Front bumper cover
- Front fender
- Fender apron panel closing panel
- Hood
- Hood hinge
- Hood strut mounting bracket
- Fender mounting plate

3. For additional information relating to this repair procedure please see the following:
 For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) /
[Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) /
[Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the hood.
 For additional information, refer to: Hood (501-02, Removal and Installation).
5. Remove the hood hinge.
6. Remove the fender apron panel closing panel.
 For additional information, refer to: [Fender Apron Panel Closing Panel](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).
7. Disconnect the generator electrical connectors.
8. Remove the windshield wiper motor and linkage.
 For additional information, refer to: [Windshield Wiper Motor](#) (501-16 Wipers and Washers, Removal and Installation).
9. Remove the ECM (engine control module).
 For additional information, refer to: Engine Control Module (ECM) (303-14A, Removal and Installation) /
 Engine Control Module (ECM) (303-14B, Removal and Installation) /
[Engine Control Module \(ECM\)](#) (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

10. NOTE: If the hood strut mounting bracket is to be replaced, it is not necessary to remove it.

Drill out the spot welds to remove the hood strut mounting bracket.

E 107735

11. NOTE: If the fender mounting plate is damaged it is not necessary to remove it from the fender apron panel.

Drill out the spot welds to release the fender mounting plate.

E 107736

12. NOTE: If the fender mounting plate is undamaged it can be reused by releasing it from the fender apron panel, leaving it attached to the suspension top mount. Drill out from underneath to allow spot welds to be used in installation.

Drill out the spot welds, from underneath, to release the fender mounting plate.

E 107737

13. NOTE: Use a belt sander where there is no access to drill.

Drill out the spot welds.

14. Separate the joints and remove the old panel.

Installation

1. Drill holes in the new panel ready for MAG plug welding.

2. Prepare the old and new panel joint surfaces.

3. NOTE: If the hood strut mounting bracket is to be replaced, it must be spot welded to the fender apron panel prior to installation. If it is to be reused it should be MAG plug welded to the fender apron panel after installation.

Install the new hood strut mounting bracket.

E 107740

4. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

5. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original.

Spot weld.

6. Offer up, align and clamp the new fender mounting plate into position, if correct, proceed to next step, if not rectify and recheck before proceeding.

7. Spot weld the new fender mounting plate into position.

8. If the original fender mounting plate is being reused, spot weld as indicated.

9. MAG Plug weld.

10. Offer up, align and clamp the hood strut mounting bracket into position and MAG plug weld.

11. Dress all welded joints.
12. The installation of associated panels and components is the reversal of removal procedure.
- Tighten the hood hinge to 25 Nm.

Front End Sheet Metal Repairs - Fender Apron Panel Closing Panel

Removal and Installation

Removal

1. NOTE: The fender apron panel closing panel is manufactured from mild steel.

The fender apron panel closing panel is serviced as a separate weld-on panel.

E107771

2. The fender apron panel closing panel is replaced in conjunction with:
 - Front bumper cover
 - Front fender
3. For additional information relating to this repair procedure please see the following:
 For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the front fender.
 For additional information, refer to: [Front Fender](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).
5. Disconnect the generator electrical connectors.
6. Remove the pedestrian protection hood actuator.
 For additional information, refer to: [Pedestrian Protection Hood Actuator LH](#) (501-20C Pedestrian Protection System, Removal and Installation) / [Pedestrian Protection Hood Actuator RH](#) (501-20C Pedestrian Protection System, Removal and Installation).
7. Remove the secondary bulkhead panel.
 For additional information, refer to: [Secondary Bulkhead Panel LH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation) / [Secondary Bulkhead Panel RH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).
8. Remove the pedestrian protection actuator bracket.
9. Release and position the fuse box to one side.
10. Release and position the wiring harness to one side.

11. NOTE: Spot welds must be drilled from underneath, this will make sure the new panel can be spot welded on installation. Use a belt sander where there is no access to drill.

Drill out the spot welds.

12. Separate the joints and remove the old panel.

Installation

1. Drill holes in the new panel ready for MAG plug welding.

E 107773

2. Prepare the old and new panel joint surfaces.

3. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

4. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original.

Spot weld.

E 107774

5. MAG Plug weld.

6. Dress all welded joints.

7. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Fender Apron Panel Front Extension

Removal and Installation

Removal

1. **NOTE:** The fender apron panel front extensions are manufactured from mild steel.

The right-hand and left-hand fender apron panel front extensions are serviced bolted on the hood latch panel. On the vehicle they are welded to the fender apron panels and inner wheelhouse.

E 103204

2. The fender apron panel front extension is replaced in conjunction with:

1. Front bumper cover
2. Front bumper
3. Hood latch panel
4. Front fender

3. For additional information relating to this repair procedure please see the following:

For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) /

[Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) /

[Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) /

[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

4. Remove the hood latch panel.

For additional information, refer to: [Hood Latch Panel](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).

5. Remove the front fender.

For additional information, refer to: [Front Fender](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).

6. Disconnect the generator electrical connectors.

7. If the left-hand fender apron panel front extension is to be repaired, remove the air conditioning (A/C) pipe.

8. Drill out the spot welds.

E 103205

9. Separate the joints and remove the old panel.

Installation

1. **NOTE:** If only one new fender apron panel front extension is to be fitted, remove the other side from the service panel and discard.

Offer up the new hood latch service panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

2. With the new panel offered up and aligned, drill 3 holes, in the areas indicated, ready for MAG plug welding.

E 104699

3. Remove the new hood latch service panel.

4. Prepare the old and new panel joint surfaces.

5. Offer up the new hood latch service panel, align and clamp into position.

6. MAG Plug weld.

E 103206

7. Remove the hood latch panel in readiness for the paint refinishing process.

8. Dress all welded joints.

9. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Fender Apron Panel Front Section

Removal and Installation

Removal

1. NOTE: The fender apron panel front section is manufactured from mild steel.

The fender apron panel front section is cut from the fender apron service panel.

E107776

2. The fender apron panel front section is replaced in conjunction with:

- Front bumper cover
- Hood
- Front fender
- Hood latch panel
- Fender apron panel front extension
- Fender apron closing panel front section

3. For additional information relating to this repair procedure please see the following:

For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) /

[Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) /

[Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) /

[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

4. NOTE: Make sure the fender apron closing panel front section is cut to allow a minimum 50mm staggered joint with the fender apron panel front section.

Remove the fender apron closing panel front section.

For additional information, refer to: [Fender Apron Closing Panel Front Section](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).

5. Disconnect the generator electrical connectors.

6. NOTE: The section is cut as indicated to allow access to dress the MAG butt weld.

Cut the old panel at the point indicated.

E 107778

7. Drill out spot welds.

E 107779

8. Separate the joints and remove the old panel.

9. Cut the new front section from the fender apron panel service panel at the point indicated.

E 107777

Installation

1. Offer up, align and clamp the new panel into position overlapping the old panel remnant. Cut along the edge of the old panel, through the new panel where the MAG butt joint is to be made.

2. Remove the new panel.
3. Prepare the old and new panel joint surfaces.
4. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
5. Tack weld the butt joint.

6. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original.

Spot weld.

7. Dress the tack welds.
8. MAG weld the butt joint.

9. Dress all welded joints.
10. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Front Bumper Mounting

Removal and Installation

Removal

1. **NOTE:** The front bumper mounting is manufactured from High Strength Low Alloy steel, 350MPa, (HSLA350).

The front bumper mounting is serviced as a separate weld-on panel, it is also serviced on the front side member & suspension top mount assembly.

E 108360

2. The front bumper mounting is replaced in conjunction with:

- Front bumper cover
- Front bumper
- Hood latch panel

3. For additional information relating to this repair procedure please see the following:

For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) /

[Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) /

[Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) /

[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

4. Remove the hood latch panel.

For additional information, refer to: [Hood Latch Panel](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).

5. Disconnect the generator electrical connectors.

6. Drill out the spot welds.

E 108361

7. Separate the joints and remove the old panel.

Installation

1. **NOTE:** Remove the caged nuts for the front bumper fixings, to allow for preparation.

Prepare the old and new panel joint surfaces.

2. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

3. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original.

Spot weld.

E 108361

4. Dress all welded joints.
5. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Front Fender

Removal and Installation

Removal

1. NOTE: The front fender is manufactured from mild steel.

The front fender is serviced as a separate bolt-on panel.

E102992

2. The front fender is replaced in conjunction with:

1. Front bumper cover

3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) /
[Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) /
[Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
5. Remove the front bumper cover.
For additional information, refer to: [Front Bumper Cover](#) (501-19 Bumpers, Removal and Installation).
6. Remove the fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
7. If the right-hand front fender is to be repaired, remove the windshield washer reservoir.
For additional information, refer to: [Windshield Washer Reservoir](#) (501-16 Wipers and Washers, Removal and Installation).
8. Remove the headlamp assembly.
For additional information, refer to: [Headlamp Assembly](#) (417-01 Exterior Lighting, Removal and Installation).
9. Remove the rocker panel outer moulding.
10. Remove the front fender.

11. NOTE: Do not disassemble further if the component is removed for access only.

Remove the front fender moulding.

Installation

1. Offer up the new panel. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
2. Install the front fender.
 - Tighten to 10 Nm.

3. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Front Fender Support Bracket

Removal and Installation

Removal

1. NOTE: The front fender support bracket is manufactured from mild steel.

The front fender support bracket is serviced as a separate weld-on panel.

E 112646

2. The front fender support bracket is replaced in conjunction with:
 - Front bumper cover
 - Front fender
 - Hood latch panel
3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the hood latch panel.
For additional information, refer to: [Hood Latch Panel](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).
5. Disconnect the generator electrical connectors.
6. If the left-hand front fender support bracket is to be repaired, remove the air conditioning (A/C) pipe.
7. Release and position the front fender support bracket wiring harness to one side.
8. NOTE: If the front fender lower mounting is undamaged it should be retained for reuse.

Remove the front fender lower mounting retaining bolt.

E 112647

9. NOTE: Use a belt sander where there is no access to drill.

Drill out the spot welds.

E 112648

10. Separate the joints and remove the old panel.

Installation

1. Prepare the old and new panel joint surfaces.
2. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

3. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible spot welds should be installed adjacent to the original.

Spot weld.

E 112648

4. Offer up the front fender lower mounting and loosely install its fixing bolt. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

E 112647

5. Tighten the front fender lower mounting fixing bolt.

- Tighten to 10 Nm.

6. Dress all welded joints.

7. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Front Side Member

Removal and Installation

Removal

1. NOTE: The front side member is manufactured from High Strength Low Alloy Steel, 350MPa, (HSLA350).

The front side member is serviced as a separate weld-on panel, which includes the hood latch panel mounting bracket. This method is to install a "long" section of the service panel.

E111823

2. In this procedure, make sure that the vehicle is correctly aligned, it must be placed on an approved alignment jig.
3. The front side member is replaced in conjunction with:
 - Front bumper cover
 - Front bumper
 - Front bumper mounting
 - Hood
 - Hood latch panel
 - Front fender support bracket
 - Front fender support bracket mounting
 - Front wheelhouse section
 - Front side member closing panel
 - Engine, transmission / transaxle, front subframe and front suspension, as an assembly
4. For additional information relating to this repair procedure please see the following:
 For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
5. Remove the hood.
 For additional information, refer to: Hood (501-02, Removal and Installation).
6. Remove the front wheelhouse section.
 For additional information, refer to: [Front Wheelhouse Section](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).
7. Remove the engine, transmission / transaxle, front subframe and front suspension, as an assembly.
 For additional information, refer to: Engine (303-01A, Removal) / Engine (303-01C, Removal) / [Engine](#) (303-01A Engine - 4.2L NA V8 - AJV8, Removal) / [Engine](#) (303-01B Engine - 4.2L SC V8 - AJV8, Removal) / Transmission - 2.7L Diesel (307-01, Removal) / Transmission - 3.0L Diesel (307-01, Removal) / Transmission - 3.0L (307-01, Removal) / [Transmission - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (307-01 Automatic Transmission/Transaxle - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal) /

Transmission - 5.0L (307-01, Removal) / [Front Shock Absorber](#) (204-01 Front Suspension, Removal and Installation) / Front Subframe - 2.7L Diesel (502-00, Removal and Installation) / Front Subframe - 3.0L (502-00, Removal and Installation) / [Front Subframe - 4.2L NA V8 - AJV8](#) (502-00 Uni-Body, Subframe and Mounting System, Removal and Installation) / [Front Subframe - 4.2L SC V8 - AJV8](#) (502-00 Uni-Body, Subframe and Mounting System, Removal and Installation).

8. Remove the pedestrian protection hood actuator.
For additional information, refer to: [Pedestrian Protection Hood Actuator LH](#) (501-20C Pedestrian Protection System, Removal and Installation) / [Pedestrian Protection Hood Actuator RH](#) (501-20C Pedestrian Protection System, Removal and Installation).
9. If the drivers side front side member and suspension top mount is to be repaired, remove the brake master cylinder and reservoir.
For additional information, refer to: [Brake Master Cylinder](#) (206-06 Hydraulic Brake Actuation, Removal and Installation) / [Brake Fluid Reservoir](#) (206-06 Hydraulic Brake Actuation, Removal and Installation).
10. If the left-hand front side member and suspension top mount assembly is to be repaired, remove the fuel supply and return lines.
11. Release and position the front side member wiring harness to one side.
12. Remove any remaining miscellaneous components from the repair area.

13. NOTE: Retain the front fender support bracket mounting if it is to be reused. If the front fender support bracket mounting is to be renewed, it is not necessary to remove or retain it.

Drill out the spot welds to remove the front fender support bracket mounting.

E117044

14. Remove the bulk of the damaged panels by cutting through the front side member and the front side member closing panel as indicated.

E117045

15.  CAUTION: Care should be taken not to cut through into the front side member or its inner lower reinforcement.

Cut the front side member closing panel as indicated.

16. Drill out the spot welds from the front side member closing panel as indicated.

17. NOTE: Retain the front side member closing panel remnant as it will be used as a template.

Separate the joints and remove the front side member closing panel remnant.

18. NOTE: Care should be taken not to cut through into the front side member inner lower reinforcement.

19. NOTE: Where possible, spot welds must be drilled out as indicated, to allow the new panel to be spot welded on installation. Mark out the position where the front side member MAG butt joint is to be made and cut through the panel at this point as indicated. Drill out the spot welds as indicated.

E117048

E117049

20. NOTE: Retain the bolts for refitment on installation.

Remove the retaining bolts as indicated.

E117050

21. NOTE: Retain the front side member remnant as it will be used as a template.

Separate the joints and remove the front side member remnant.

Installation

1. Drill out one spot weld, separate and cut a template from the rear of the front side member remnant as indicated.

E117051

2. NOTE: Dress the panel joint surfaces of the template to allow a good fit.

Offer up, align and clamp the template into position on the new side member service panel. Cut along the edge of the template, through the new panel, as indicated, where the MAG butt joint is to be made.

3. Cut a template from the rear of the front side member closing panel remnant as indicated.

4. NOTE: Dress the panel joint surfaces of the template to allow a good fit.

Offer up, align and clamp the front side member closing panel remnant into position on the new side member closing panel service panel. Cut along the edge of the template, through the new panel, as indicated, where the MAG butt joint is to be made.

5. Prepare the panel joint surfaces of the old and new front side member.

6. Offer up the new front side member and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

7. Install the retaining bolts.

- Tighten to XXNm.

8. Tack MAG weld the front side member butt joint.
9. Dress the front side member MAG tack welds.
10. MAG weld the front side member butt joint.

11. MAG plug weld.

12. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

E117057

13. Dress all welded joints.
14. Apply a zinc rich primer to any bare metal surfaces at this stage.
15. Drill holes in the new side member closing panel ready for MAG plug welding.

E117058

16. Prepare the panel joint surfaces of the old and new front side member closing panel.
17. Offer up the new front side member closing panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
18. Tack MAG weld the front side member closing panel butt joint.
19. Dress the front side member closing panel MAG tack welds.
20. MAG weld the front side member closing panel butt joint.

E 117059

21. MAG plug weld.

E 117060

22. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

E117061

23. Dress all welded joints.

24. **NOTE:** If a new front fender support bracket mounting is to be installed, drill 3 holes ready for MAG plug welding.

Prepare the panel joint surfaces of the front fender support bracket mounting and the front side member closing panel.

25. Offer up the front fender support bracket mounting and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

26. MAG plug weld.

E117044

27. Dress the MAG plug welds.

28. Install the front bumper mounting.

For additional information, refer to: [Front Bumper Mounting](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).

29. Make sure any remaining areas of bare metal created during this procedure are treated with a zinc primer prior to the installation of outer panels.

30. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Front Side Member and Suspension Top Mount Assembly

Removal and Installation

Removal

1. NOTE: The front side member and suspension top mount assembly is, an assembly of panels, manufactured from High Strength Low Alloy Steel, 350MPa, (HSLA350) and mild steel.

The front side member and suspension top mount assembly is serviced as a separate weld-on panel. The assembly includes, the front bumper mounting, hood latch support panel, front side member, front side member closing panel, front wheelhouse section, front fender support bracket mounting, suspension top mount and the inner apron and wheelhouse panels

E112841

2. In this procedure, to make sure that the vehicle is correctly aligned, it must be placed on an approved alignment jig.
3. The front side member and suspension top mount assembly is replaced in conjunction with:
 - Front bumper cover
 - Front bumper
 - Front fender
 - Hood
 - Hood hinge
 - Hood latch panel
 - Front fender support bracket
 - Fender apron panel front extension
 - Fender apron panel closing panel
 - Fender apron panel
 - Hood strut mounting bracket

- Fender mounting plate
 - Instrument panel console
 - Engine, transmission / transaxle, front subframe and front suspension, as an assembly
4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
 5. Remove the fender apron panel front extension.
For additional information, refer to: [Fender Apron Panel Front Extension](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).
 6. Remove the front fender support bracket.
For additional information, refer to: [Front Fender Support Bracket](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).
 7. Remove the fender apron panel.
For additional information, refer to: [Fender Apron Panel](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).
 8. Remove the engine, transmission / transaxle, front subframe and front suspension, as an assembly.
For additional information, refer to: [Engine](#) (303-01A, Removal) / [Engine](#) (303-01C, Removal) / [Engine](#) (303-01A Engine - 4.2L NA V8 - AJV8, Removal) / [Engine](#) (303-01B Engine - 4.2L SC V8 - AJV8, Removal) / [Transmission](#) - 2.7L Diesel (307-01, Removal) / [Transmission](#) - 3.0L Diesel (307-01, Removal) / [Transmission](#) - 3.0L (307-01, Removal) / [Transmission - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (307-01 Automatic Transmission/Transaxle - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal) / [Transmission](#) - 5.0L (307-01, Removal) / [Front Shock Absorber](#) (204-01 Front Suspension, Removal and Installation) / [Front Subframe](#) - 2.7L Diesel (502-00, Removal and Installation) / [Front Subframe](#) - 3.0L (502-00, Removal and Installation) / [Front Subframe - 4.2L NA V8 - AJV8](#) (502-00 Uni-Body, Subframe and Mounting System, Removal and Installation) / [Front Subframe - 4.2L SC V8 - AJV8](#) (502-00 Uni-Body, Subframe and Mounting System, Removal and Installation).
 9. Remove the pedestrian protection hood actuator.
For additional information, refer to: [Pedestrian Protection Hood Actuator LH](#) (501-20C Pedestrian Protection System, Removal and Installation) / [Pedestrian Protection Hood Actuator RH](#) (501-20C Pedestrian Protection System, Removal and Installation).
 10. If the drivers side front side member and suspension top mount is to be repaired, remove the brake master cylinder and reservoir.
For additional information, refer to: [Brake Master Cylinder](#) (206-06 Hydraulic Brake Actuation, Removal and Installation) / [Brake Fluid Reservoir](#) (206-06 Hydraulic Brake Actuation, Removal and Installation).
 11. If the drivers side front side member and suspension top mount is to be repaired, remove the brake booster.
For additional information, refer to: [Brake Booster](#) (206-07 Power Brake Actuation, Removal and Installation).
 12. Remove the left-hand and right-hand front seats.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
 13. Remove the heater core and evaporator core housing.
For additional information, refer to: [Heater Core and Evaporator Core Housing](#) (412-01 Climate Control, Removal and Installation).
 14. Remove the front safety belt retractor.

For additional information, refer to: [Front Safety Belt Retractor](#) (501-20A Safety Belt System, Removal and Installation).

15. Remove the B-pillar side impact sensor.
For additional information, refer to: [B-Pillar Side Impact Sensor](#) (501-20B Supplemental Restraint System, Removal and Installation).
16. Remove the left-hand and right-hand front floor covering.
17. Remove the rear floor covering.
18. If the left-hand front side member and suspension top mount assembly is to be repaired, remove the left-hand rear foot well duct.
19. If the right-hand front side member and suspension top mount assembly is to be repaired, remove the right-hand rear foot well duct.
20. If the drivers side front side member and suspension top mount is being repaired, remove the pedal box.
21. Release and position the insulating material at the inner bulkhead to one side.
22. Release and position the inner bulkhead and floor panel wiring harness to one side.
23. Drain the fuel tank.
For additional information, refer to: [Fuel Tank Draining](#) (310-00 Fuel System - General Information, General Procedures).
24. If the left-hand front side member and suspension top mount assembly is to be repaired, remove the left-hand under shield.
25. If the right-hand front side member and suspension top mount assembly is to be repaired, remove the right-hand under shield.
26. If the left-hand front side member and suspension top mount assembly is to be repaired, remove the fuel supply and return pipes.
27. For diesel engine vehicles only, if the left-hand front side member and suspension top mount assembly is to be repaired, remove the fuel cooler.
28. If the right-hand front side member and suspension top mount assembly is to be repaired, release and position the underfloor wiring harness to one side.
29. If the right-hand front side member and suspension top mount assembly is to be repaired, remove the front to rear brake pipes.
30. Remove the exhaust heat shields.
31. Release and position the front side member and suspension top mount wiring harness to one side.
32. Remove any remaining miscellaneous components from the repair area as necessary.

33. NOTE: Remove the sealer to expose the spot welds.

Drill out the spot welds as indicated.

34. NOTE: Remove the sealer to expose the spot welds.

• NOTE: Use a belt sander where there is no access to drill. The three spot welds at the rocker panel should be drilled from outside and right through, to allow MAG plug welding on installation

Drill out the spot welds as indicated.

E112844

35. NOTE: The removal of the bulkhead reinforcement is required to gain access to drill out two spot welds.

Remove the bulkhead reinforcement panel, by performing a saw cut at the points as indicated.

36. Separate the joints and remove the bulkhead reinforcement panel.

37. Drill out the spot welds as indicated.

38. Drill out the spot welds as indicated.

39. NOTE: The spot welds indicated should be drilled from inside the engine compartment, to allow spot welding on installation.

Drill out the spot welds as indicated.

40. NOTE: Remove the NVH (noise, vibration and harshness) sound deadening material to expose the spot welds.

• NOTE: The spot welds indicated should be drilled from inside and right through, to allow MAG plug welding on installation.

Drill out the spot welds as indicated.

41.  CAUTION: This step requires the aid of another technician as the removed panel will be heavy.

Separate the joints and remove the old panel.

Installation

1. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

2. NOTE: To avoid overlapping MAG plug welds, the original removal holes must be marked so that they can be avoided when drilling the adjacent MAG plug holes.

Mark the position of the drilled holes as indicated, on the new panel.

3. Remove the new panel.

4. NOTE: Holes should be drilled avoiding the areas previously marked.

Drill holes in the new panel ready for MAG plug welding.

E 112855

5. Prepare the old and new panel joint surfaces.

6. NOTE: On installation, a MAG run replaces two spot welds which cannot be MAG plugged due to restricted access.

Prepare the old and new panel joint surfaces at the point indicated, where the MAG run is to be performed.

E 112856

7. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

8. MAG plug weld at the points indicated.

E 112843

9. MAG plug weld at the points indicated.

E112845

10. MAG plug weld at the points indicated.

E 112848

11. MAG plug weld at the points indicated.

E 112850

12. MAG plug weld at the points indicated.

E 112853

13. NOTE: A MAG weld run replaces the original two spot welds as there is no access to install spot welds or MAG plug welds in this area. The MAG weld run should be performed avoiding the area of adhesive.

Perform a MAG weld run, of approx 30mm as indicated.

E 112856

14. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

E 112851

15. Dress all welded joints.

16. Make sure any remaining areas of bare metal created during this procedure are treated with a zinc primer prior to the installation of outer panels.

17. Install the NVH sound deadening material in the areas indicated.

E 112857

18. NOTE: Make sure all underbody joints are fully sealed following this repair procedure.

The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Front Side Member Closing Panel

Removal and Installation

Removal

1. NOTE: The front side member closing panel is manufactured from High Strength Low Alloy Steel, 350MPa, (HSLA350).

The front side member closing panel is serviced as a separate weld-on panel.

E111830

2. In this procedure, to ensure the vehicle is correctly aligned, it must be placed on an approved alignment jig.
3. The front side member closing panel is replaced in conjunction with:
 - Front bumper cover
 - Front bumper
 - Front bumper mounting
 - Hood
 - Hood latch panel
 - Front fender support bracket
 - Front fender support bracket mounting
 - Front wheelhouse section
 - Front side member
 - Engine, transmission / transaxle, front subframe and front suspension, as an assembly
4. For additional information relating to this repair procedure please see the following:
 For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
5. NOTE: This procedure assumes that if the front side member closing panel is damaged, the front side member will also be damaged. Therefore, the replacement procedure for the front side member closing panel is combined within the front side member procedure.

Remove the front side member.

For additional information, refer to: [Front Side Member](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).

Installation

1. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Front Side Member Closing Panel Section

Removal and Installation

Removal

1. NOTE: The front side member closing panel section is manufactured from High Strength Low Alloy Steel, 350MPa, (HSLA350).

The front side member closing panel section is cut from the front side member closing panel service panel.

E111830

2. In this procedure, to make sure that the vehicle is correctly aligned, it must be placed on an approved alignment jig.
3. The front side member closing panel section is replaced in conjunction with:
 - Front bumper cover
 - Front bumper
 - Front bumper mounting
 - Hood
 - Hood latch panel
 - Front side member section
4. For additional information relating to this repair procedure please see the following:
 For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
5. NOTE: This procedure assumes that if the front side member closing panel section is damaged, the front side member section will also be damaged. Therefore the removal procedure for the front side member closing panel section is combined within the front side member section procedure.

Remove the front side member section.

For additional information, refer to: [Front Side Member Section](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).

Installation

1. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Front Side Member Section

Removal and Installation

Removal

1. NOTE: The front side member section is manufactured from High Strength Low Alloy Steel, 350MPa, (HSLA350).

The front side member section is cut from the front side member service panel, which includes the hood latch panel mounting bracket.

E111823

2. In this procedure, to make sure that the vehicle is correctly aligned, it must be placed on an approved alignment jig.

3. NOTE: This procedure assumes that the front side member closing panel section is damaged. Therefore, the procedure combines the repair of the front side member section and the front side member closing panel section.

The front side member section is replaced in conjunction with:

- Front bumper cover
- Front bumper
- Front bumper mounting
- Hood
- Hood latch panel
- Front side member closing panel section
For additional information, refer to: [Front Side Member Closing Panel Section](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Remove the hood.
For additional information, refer to: [Hood](#) (501-02, Removal and Installation).

6. Remove the front bumper mounting.
For additional information, refer to: [Front Bumper Mounting](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).

7. Disconnect the generator electrical connectors.

E111824

8. NOTE: Removal of the hood latch panel mounting bracket is required to enable the section cut line to be marked out and performed on the front side member.

Drill out the spot welds and remove the hood latch panel mounting bracket.

E111825

9. NOTE: The measurements shown allow the section to be performed, avoiding the inner reinforcements and allowing for a minimum 50mm staggered joint with the front side member closing panel section.

Mark out the position where the front side member section MAG butt joint is to be made. Cut through the front side member at this point, also cutting through the front side member closing panel as indicated.

10.  **CAUTION:** Care should be taken not to cut through into the front side member.

Mark out the position where the front side member closing panel section MAG butt joint is to be made. Cut through the front side member closing panel at this point as indicated.

E111826

11. Drill out the spot welds from the front side member closing panel remnant.

E111827

12. Separate the joints and remove the front side member closing panel remnant.

Installation

1. **NOTE:** Removal of the hood latch panel mounting bracket is required to enable the section cut line to be marked out and performed on the front side member. Retain the hood latch panel mounting bracket as it will be reused.

Drill out the spot welds and remove the hood latch panel mounting bracket from the side member service panel.

E111828

2. Mark out the position on the front side member service panel, where the section MAG butt joint is to be made and cut the panel at this point as indicated.

E 111829

3. Mark out the position on the front side member closing panel service panel, where the section MAG butt joint is to be made and cut the panel at this point as indicated.

E 111831

4. Prepare the panel joint surfaces of the old and new front side member and front side member closing panel sections.
5. Offer up the new front side member section and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
6. Tack MAG weld the front side member section butt joint.
7. Dress the front side member section MAG tack welds.

8. MAG weld the front side member section butt joint.

E111832

9. Dress the front side member section MAG butt joint.

10. Apply a zinc rich primer to any bare metal surfaces at this stage.

11. Offer up the new front side member closing panel section and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

12. Tack MAG weld the front side member closing panel section butt joint.

13. Dress the front side member closing panel section MAG tack welds.

14. MAG weld the front side member closing panel section butt joint.

E111833

15. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld the front side member closing panel section to the front side member.

E111834

16. Dress the spot welds and the front side member closing panel section MAG butt joint.

17. Drill holes in the new hood latch panel mounting bracket ready for MAG plug welding.

E111906

18. Prepare the panel joint surfaces of the new hood latch panel mounting bracket and the corresponding joints on the front side member section.

19. MAG plug weld the hood latch panel mounting bracket to the front side member section.

E 111835

20. Dress the hood latch panel mounting bracket MAG plug welds.

21. Make sure any remaining areas of bare metal created during this procedure are treated with a zinc primer prior to the installation of outer panels.

22. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Front Wheelhouse Section

Removal and Installation

Removal

1. NOTE: The left hand service panel is illustrated.

- NOTE: The front wheelhouse section is manufactured from mild steel.

The front wheelhouse section is serviced as a separate weld-on panel, the left-hand is serviced less the weld-on air cleaner mounting bracket. It is also serviced on the front side member and suspension top mount assembly, the left-hand assembly includes the air cleaner mounting bracket.

E 111995

2. The front wheelhouse section is replaced in conjunction with:
 - Front bumper cover
 - Front fender
 - Hood latch panel
 - Front fender support bracket
3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the front fender support bracket.
For additional information, refer to: [Front Fender Support Bracket](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).
5. Disconnect the generator electrical connectors.

6. Drill out the spot welds.

7. NOTE: If the left-hand front wheelhouse section is to be repaired, retain the old panel if the air cleaner mounting bracket is to be reused.

Separate the joints and remove the old panel.

8. If the left-hand front wheelhouse section is to be repaired, drill out the spot welds for the air cleaner mounting bracket from underneath so that it can be reused.

9. NOTE: If undamaged, the air cleaner mounting bracket should be retained for installation on the new panel.

Separate and remove the air cleaner mounting bracket.

Installation

1. NOTE: If adjacent panels are being repaired and access allows, spot welds should be installed where possible.

Drill holes in the new panel ready for MAG plug welding.

E 111998

2. Prepare the old and new panel joint surfaces.
3. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

4. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original.

Spot weld.

E 111999

5. NOTE: If adjacent panels are being repaired and access allows, spot welds should be installed where possible.

MAG plug weld.

6. Prepare the panel joint surfaces of the air cleaner mounting bracket.

7. Offer up the air cleaner mounting bracket and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

8. Spot weld the air cleaner mounting bracket.

9. Dress all welded joints.

10. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Hood Latch Panel

Removal and Installation

Removal

1. **NOTE:** The hood latch panel is manufactured from mild steel.

The hood latch panel is serviced as a separate bolt-on panel and includes the left-hand and right-hand fender apron panel front extensions. These are removed and discarded unless damaged.

E102951

2. The hood latch panel is replaced in conjunction with:

1. Front bumper cover
2. Front bumper

3.  **WARNING:** The hood latch panel and its associated components form part of the pedestrian protection system, it is essential that any repair or replacement operations do not affect the safe working of the system.

For additional information relating to the pedestrian safety system please see the following:
For additional information, refer to: [Pedestrian Protection System](#) (501-20C Pedestrian Protection System, Description and Operation).

4. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
5. Remove the front bumper.
For additional information, refer to: Front Bumper (501-19, Removal and Installation).
6. Remove both headlamp assemblies.
For additional information, refer to: [Headlamp Assembly](#) (417-01 Exterior Lighting, Removal and Installation).
7. Remove the condenser core.
For additional information, refer to: Condenser Core - 2.7L Diesel (412-03, Removal and Installation) / Condenser Core - 3.0L (412-03, Removal and Installation) / [Condenser Core - 4.2L NA V8 - AJV8](#) (412-03 Air Conditioning, Removal and Installation) / [Condenser Core - 4.2L SC V8 - AJV8](#) (412-03 Air Conditioning, Removal and Installation).

8. Remove the radiator.
For additional information, refer to: Radiator (303-03A, Removal and Installation) / Radiator (303-03B, Removal and Installation) / [Radiator - 4.2L SC V8 - AJV8](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation) / [Radiator - 4.2L NA V8 - AJV8](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
9. Remove the both hood latch panel braces.
10. Remove the cooling fan upper shroud.
11. Remove both crash sensors.
For additional information, refer to: [Crash Sensor](#) (501-20B Supplemental Restraint System, Removal and Installation).
12. Remove the both hood latches.
13. Remove the hood safety hook guide.
14. Remove both hood latch panel buffers.
15. Release and lay aside the hood latch panel wiring harness.
16. Remove the old panel.

Installation

1. Offer up the new panel. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
2. Install the hood latch panel.
 - Tighten to 10 Nm.

3. The installation of associated panels and components is the reversal of removal procedure.

Front End Sheet Metal Repairs - Hood Latch Panel Mounting Bracket

Removal and Installation

Removal

1. NOTE: The hood latch panel mounting bracket is manufactured from mild steel.

The hood latch panel mounting bracket is serviced as a separate weld-on panel.

E112780

2. The hood latch panel mounting bracket is replaced in conjunction with:

- Front bumper cover
- Front bumper
- Hood
- Hood latch panel

3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) /
[Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) /
[Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

4. Remove the hood latch panel.
For additional information, refer to: [Hood Latch Panel](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).

5. Remove the hood.
For additional information, refer to: [Hood](#) (501-02, Removal and Installation).

6. NOTE: Use a belt sander where there is no access to drill.

Drill out the spot welds.

E 112781

7. Separate the joints and remove the old panel.

Installation

1. Drill holes in the new panel ready for MAG plug welding.

E 112782

2. Prepare the old and new panel joint surfaces.

3. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

4. MAG plug weld.

E 112783

5. Dress all welded joints.

6. The installation of associated panels and components is the reversal of removal procedure.

Roof Sheet Metal Repairs - Roof

Description and Operation

Roof service panels

E114231

Item	Description
1	Roof panel with sliding roof
2	Roof panel without sliding roof

Time schedules, roof panels

The following information shows the total time taken to install single panels and complete assemblies. This time includes removal of Mechanical, Electrical and Trim, (MET), items, plus paint times based on Metallic Clear Over Base Paint, (blends for adjacent panels are not included).

The times shown were generated by Thatcham, (the Motor Insurance Repair Research Centre), and are to be used as a guide only.

Single panel times

Panel Description	Hours
Roof panel without sliding roof	18.6

Roof Sheet Metal Repairs - Roof Panel Vehicles With: Sliding Roof Opening Panel

Removal and Installation

Removal

1. **NOTE:** The roof panel is manufactured from mild steel.

The roof panel is serviced as a separate weld-on panel.

E102825

2. The roof panel is replaced in conjunction with:
 - Headliner
 - Windshield
 - Rear window glass
3. For additional information relating to this repair procedure please see the following:
 For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove both front seats.
 For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
5. Disconnect the battery ground cable.
 For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
6. Disconnect the generator electrical connectors.
7. Remove the windshield glass.
 For additional information, refer to: [Windshield Glass](#) (501-11 Glass, Frames and Mechanisms, Removal and Installation).
8. Remove the rear window glass.

- For additional information, refer to: [Rear Window Glass](#) (501-11 Glass, Frames and Mechanisms, Removal and Installation).
9. Remove the roof opening panel frame.
For additional information, refer to: [Roof Opening Panel Frame](#) (501-17 Roof Opening Panel, Removal and Installation).
 10. Remove the driver and passenger side front scuff plate trim panels.
For additional information, refer to: [Front Scuff Plate Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
 11. Remove the driver and passenger side rear scuff plate trim panels.
For additional information, refer to: [Rear Scuff Plate Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
 12. Remove the driver and passenger side air curtain modules.
For additional information, refer to: [Side Air Curtain Module](#) (501-20B, Removal and Installation).
 13. Remove the rear seat backrest.
 14. Remove the driver and passenger side rear safety belt retractors.
For additional information, refer to: [Rear Safety Belt Retractor](#) (501-20A Safety Belt System, Removal and Installation).
 15. Remove the rear center safety belt retractor.
For additional information, refer to: [Rear Center Safety Belt Retractor](#) (501-20A Safety Belt System, Removal and Installation).
 16. Remove the driver and passenger side RF filters.
 17. Remove the diversity antenna module.
 18. Remove the antenna.
For additional information, refer to: [Navigation System Antenna](#) (419-07 Navigation System, Removal and Installation).
 19. Release and position the roof wiring harnesses to one side
 20. Position the roof opening panel front and rear drain hoses to one side.
 21. Remove the driver and passenger side roof mouldings.
 22. Drill out the spot welds.

23. Separate the joints and remove the old panel.

Installation

1. NOTE: The slots should be made so that the new roof panel can be brazed to the A-Pillar outer and inner.

Cut 2 slots in the new roof panel.

E102826

2. Prepare the old and new panel joint surfaces.
3. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
4. Remove the new panel.
5. NOTE: Make sure the adhesive is kept away from the area of MIG brazed slots.

Apply adhesive to the areas indicated.

6. Offer up the new panel and clamp into position.
7. Spot weld.

8. MIG braze the slots.

9. Remove any excess adhesive and dress all welded/brazed joints.

10. Make sure the external areas around the MIG brazed slots are sealed as part of the paint preparation process as this cannot be performed satisfactorily during panel replacement.

11. Install NVH (noise, vibration and harshness) sound deadening pads.

12. The installation of associated panels and components is the reversal of removal procedure.

Roof Sheet Metal Repairs - Roof Panel Vehicles Without: Sliding Roof Opening Panel

Removal and Installation

Removal

1. **NOTE:** The roof panel is manufactured from mild steel.

The roof panel is serviced as a separate weld-on panel.

E102834

2. The roof panel is replaced in conjunction with:
 - Headliner
 - Windshield
 - Rear window glass
3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove both front seats.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
5. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
6. Disconnect the generator electrical connectors.
7. Remove the windshield glass.
For additional information, refer to: [Windshield Glass](#) (501-11 Glass, Frames and Mechanisms, Removal and Installation).
8. Remove the rear window glass.

- For additional information, refer to: [Rear Window Glass](#) (501-11 Glass, Frames and Mechanisms, Removal and Installation).
9. Remove the headliner.
For additional information, refer to: [Headliner](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
 10. Remove the driver and passenger side front scuff plate trim panels.
For additional information, refer to: [Front Scuff Plate Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
 11. Remove the driver and passenger side rear scuff plate trim panels.
For additional information, refer to: [Rear Scuff Plate Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
 12. Remove the driver and passenger side air curtain modules.
For additional information, refer to: [Side Air Curtain Module](#) (501-20B, Removal and Installation).
 13. Remove the rear seat backrest.
 14. Remove the driver and passenger side rear safety belt retractors.
For additional information, refer to: [Rear Safety Belt Retractor](#) (501-20A Safety Belt System, Removal and Installation).
 15. Remove the rear center safety belt retractor.
For additional information, refer to: [Rear Center Safety Belt Retractor](#) (501-20A Safety Belt System, Removal and Installation).
 16. Remove the driver and passenger side RF filters.
 17. Remove the diversity antenna module.
 18. Remove the antenna.
For additional information, refer to: [Navigation System Antenna](#) (419-07 Navigation System, Removal and Installation).
 19. Release and position the roof wiring harnesses to one side
 20. Remove the driver and passenger side roof mouldings.
 21. Drill out the spot welds.

E102836

22. Separate the joints and remove the old panel.

Installation

1. NOTE: The slots should be made so that the new roof panel can be brazed to the A-Pillar outer and inner.

Cut 2 slots in the new roof panel.

E102835

2. Prepare the old and new panel joint surfaces.
3. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not, rectify and recheck before proceeding.
4. Remove the new panel.
5. NOTE: Make sure the adhesive is kept away from the area of MIG brazed slots.

Apply adhesive to the areas indicated.

6. Offer up the new panel and clamp into position.
7. Spot weld.

8. MIG braze the slots.

9. Remove any excess adhesive and dress all welded / brazed joints.

10. Make sure the external areas around the MIG brazed slots are sealed as part of the paint preparation process as this cannot be performed satisfactorily during panel replacement.

11. Install the NVH (noise, vibration and harshness) sound deadening pads.

12. The installation of associated panels and components is the reversal of removal procedure.

Side Panel Sheet Metal Repairs - Side Panel Sheet Metal

Description and Operation

Side service panels

E114230

• NOTE: The illustration may indicate either hand of the service panel, the opposite hand will be similar.

Item	Description
1	Front fender
2	Front door
3	Rear door

Item	Description
4	Front door skin panel
5	Rear door skin panel
6	Quarter panel
7	Rocker panel
8	Rocker panel front section (cut from rocker panel)
9	Rocker panel rear section (cut from rocker panel)
10	Rocker panel inner reinforcement
11	Rocker panel and b-pillar outer panel
12	B-pillar reinforcement
13	B-pillar inner panel
14	A-pillar outer panel
15	A-pillar reinforcement
16	Fender apron panel
17	Fender apron panel closing panel

Time schedules, side panels

The following information shows the total time taken to install single panels and complete assemblies. This time includes removal of Mechanical, Electrical and Trim, (MET), items, plus paint times based on Metallic Clear Over Base Paint, (blends to adjacent panels are not included).

The times shown were generated by Thatcham, (the Motor Insurance Repair Research Centre), and are to be used as a guide only.

Single panel times

Panel Description	Hours
Front fender L/H	8.9
Front fender R/H	9.1
Front door	8.8
Rear door	8.7
Front door skin panel	11.1
Rear door skin panel	10.8
Quarter panel L/H	23.2
Quarter panel R/H	24.2
Rocker panel L/H	19.6
Rocker panel R/H	19.9
Rocker panel front section L/H	18.5
Rocker panel front section R/H	18.8
Rocker panel rear section L/H	16.7
Rocker panel rear section R/H	16.8
Windshield glass remove and install	2.2
Rear window glass remove and install	1.7
Headliner remove and install	3.3
Instrument panel console remove and install	5.3

Combination panel replacement times

The following panel combination times show the total time to remove/install body panels, MET items and paint times based on Metallic Clear Over Base Paint process, (blends to adjacent panels are not included).

Combination panel times

Panel Description	Hours
Front fender	
Front door	
Total Time	L/H 12.7 R/H 12.9

Combination panel times

Panel Description	Hours
Rear door	
Quarter panel	
Rear window glass remove and install	
Headliner remove and install	
Total Time	L/H 29.0 R/H 30.00

Combination panel times

Panel Description	Hours
Front door	
Rear door	
Rocker panel and b-pillar outer panel	
B-pillar reinforcement	
B-pillar inner panel	
Headliner remove and install	
Total Time	L/H 39.0 R/H 39.0

Combination panel times

Panel Description	Hours

Total Time	

Side Panel Sheet Metal Repairs - A-Pillar Outer Panel

Removal and Installation

Removal

1. NOTE: The A-pillar outer panel is manufactured from mild steel.

The A-pillar outer panel is serviced as a separate weld-on panel. It is not serviced with its riv-nuts for the fender fixings or NVH (noise, vibration and harshness) components.

E 108452

2. NOTE: The A-pillar outer panel is spot welded to the A-pillar reinforcement upper, which is boron steel. In repair, spot welds are replaced with MIG braze and MIG braze slots in these areas.

In this procedure the upper butt joint is best performed as low as possible due to the work involved in the area of MIG slot braze. If damage dictates, it is permissible to make the section higher up the pillar.

3. The A-pillar outer panel is replaced in conjunction with:

1. Front bumper cover
2. Front fender
3. Hood
4. Front door
5. Headliner
6. Instrument panel console
7. Windshield glass

4. For additional information relating to this repair procedure please see the following:

For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

5. Disconnect the generator electrical connectors.

6. Remove the instrument panel console.

For additional information, refer to: [Instrument Panel Console](#) (501-12 Instrument Panel and Console, Removal and Installation).

7. Remove the headliner.

For additional information, refer to: [Headliner](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

8. Remove the windshield glass.

For additional information, refer to: [Windshield Glass](#) (501-11 Glass, Frames and Mechanisms, Removal and Installation).

9. Remove the pedestrian protection hood actuator.

For additional information, refer to: [Pedestrian Protection Hood Actuator LH](#) (501-20C Pedestrian Protection System, Removal and Installation) / [Pedestrian Protection Hood Actuator RH](#) (501-20C Pedestrian Protection System, Removal and Installation).

10. Release and position the floor covering to one side.
11. Release and position the bulkhead insulating material to one side.
12. Release and position the inner rocker panel wiring harness to one side.
13. Remove the wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
14. Remove the underfloor splash shield.
15. If the right-hand A-pillar outer panel is to be repaired, release and position the underfloor wiring harness to one side.
16. Remove the front fender.
For additional information, refer to: [Front Fender](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).
17. Remove the front door.
For additional information, refer to: [Front Door](#) (501-03 Body Closures, Removal and Installation).
18. Remove the upper and lower front door hinges.
19. Remove the hood.
For additional information, refer to: [Hood](#) (501-02, Removal and Installation).
20. Remove the hood hinge.

21. NOTE: If a new fender apron panel closing panel is to be fitted the section will not be required.

Drill out the spot welds and cut a section from the fender apron panel closing panel, to allow access to the A-pillar joints as indicated.

22.  CAUTION: Care should be taken not to cut through into the inner panels.

- NOTE: In this procedure the upper butt joint is best performed as low as possible due to the work involved in the area of MIG braze slots. If damage dictates, it is permissible to perform the butt joint higher up the pillar.

- NOTE: Observe the increased pitch required for the MIG braze slots in this area.

Using the new panel for reference and allowing for an overlap, cut the old panel at the point indicated. Make sure that the location of the upper butt joint is calculated to allow for the installation of the MIG braze slots.

E108454

23. Using the new panel for reference and allowing for an overlap, cut the old panel at the point indicated, where the lower butt joint is to be made.

E 108455

24. NOTE: A drill bit suitable for drilling boron should be used on the upper spot welds, as indicated.

Drill out the spot welds.

E108456

25. Separate the joints and remove the old panel, also releasing the NVH components.

Installation

1. Trim the excess from the upper part of the service panel.

E 108457

2. Install the riv-nuts into the new rocker panel front section as indicated.

E102807

E108458

3.  CAUTION: Care should be taken not to cut through into the inner panels.

- NOTE: Temporarily install the front door and hinges to aid alignment.

Offer up, align and clamp the new panel into position, overlapping the old panel remnant. Cut through the new panel, partially cutting the old panel at the points where the butt joints are to be made.

4. Remove the front door and hinges and the new A-pillar outer panel.
5. Cut and remove the old panel remnants.
6. NOTE: Ensure the MAG plug holes are performed away from the adhesive bond path.

Drill holes in the new panel ready for MAG plug welding.

E 108459

7. NOTE: Observe the increased pitch required for the MIG braze slots in this area.

Cut slots in the new panel ready for MIG braze slots.

E108460

8. NOTE: If necessary, renew the NVH components.

Prepare the old and new panel joint surfaces, including the NVH components.

9. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

10. Remove the new A-pillar outer panel.

11. NOTE: Make sure the adhesive does not encroach into the area of the MAG plug welds as it will contaminate the weld (any unsealed areas must be sealed following the repair).

Apply adhesive to the area as indicated.

E 108461

12. Apply sealer adhesive to the NVH components as indicated.

E 108462

13. Offer up the new A-pillar outer panel, align and clamp into position.

14. Tack MIG braze the upper butt joint.

15. Tack MAG weld the lower butt joint.

16. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

E 108463

17. MAG plug weld.

E 108464

18. MIG Braze the slots.

E 108465

19. Dress the tack welds/braze.

20. MIG braze the upper butt joint.

E 108466

21. MAG weld the lower butt joint.

E 108467

22. Prepare the old and new panel joint surfaces of the fender apron panel closing panel section.

23. NOTE: If a new fender apron panel closing panel is to be fitted the section will not be required.

Tack MAG weld the fender apron panel closing panel section.

24. MAG plug weld and MAG weld the fender apron panel closing panel section.

E 108453

25. Dress all welded/brazed joints.

26. NOTE: It may be necessary to temporarily seal the opening whilst the foam cures, to prevent it encroaching into the hood hinge area.

Apply expanding foam into the A-pillar as indicated.

27. Make sure that any open or exposed panel joints are suitably sealed following this procedure.

28. The installation of associated panels and components is the reversal of removal procedure.

- Tighten the hood hinge bolts to 17 Nm.
- Tighten the upper and lower front door hinges to 30 Nm.

Side Panel Sheet Metal Repairs - A-Pillar Reinforcement

Removal and Installation

Removal

E111836

1. NOTE: The A-pillar reinforcement is manufactured from Bake Hardened Steel, 300MPa, (BH300). It contains reinforcements manufactured from High Strength Low Alloy Steel, 340MPa (HSLA340).

The A-pillar reinforcement panel is serviced as a separate weld-on panel. It is not serviced with its **NVH (noise, vibration and harshness)** components.

2. NOTE: The A-pillar reinforcement is spot welded to the A-pillar reinforcement upper, which is boron steel. In repair spot welds are replaced with MIG braze slots in this area.

The A-pillar reinforcement is replaced in conjunction with:

1. Front bumper cover
2. Front fender
3. Hood
4. Hood hinge
5. Front door
6. Front door hinges
7. Fender apron panel closing panel
8. A-pillar outer panel
9. Fender apron panel
10. Headliner
11. Instrument panel console
12. Windshield glass

3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Disconnect the generator electrical connectors.
5. Remove the fender apron panel.
For additional information, refer to: [Fender Apron Panel](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).
6. Remove the A-pillar outer panel.
For additional information, refer to: [A-Pillar Outer Panel](#) (501-29 Side Panel Sheet Metal Repairs, Removal and

Installation).

7. Remove the side air curtain module.
For additional information, refer to: [Side Air Curtain Module \(501-20B, Removal and Installation\)](#).
8. Remove the front seat.
For additional information, refer to: [Front Seat \(501-10 Seating, Removal and Installation\)](#).
9. Remove the floor covering.
10. If the passenger side A-pillar reinforcement is to be repaired, remove the heater core and evaporator core housing.
For additional information, refer to: [Heater Core and Evaporator Core Housing \(412-01 Climate Control, Removal and Installation\)](#).
11. If the right-hand A-pillar reinforcement is to be repaired, remove the central junction box.
For additional information, refer to: [Central Junction Box \(CJB\) \(418-00 Module Communications Network, Removal and Installation\)](#).
12. If the drivers side A-pillar reinforcement is to be repaired, remove the pedal box.
13. Release and lay aside the insulating material at the inner bulkhead.
14. Release and position aside the inner bulkhead and floor panel wiring harness.
15. NOTE: The NVH components may have already been removed on the outer panel.

Remove the upper and lower NVH components and if undamaged retain for reuse.

E111837

16. Remove an area of adhesive above the upper front door hinge mounting point to expose hidden spot welds.

E111838

17. Remove the bolts as indicated and retain for reuse.

E111839

18. NOTE: A drill bit suitable for drilling boron should be used on the boron spot welds.

Drill out the boron spot welds as indicated.

E111840

19. NOTE: A drill bit suitable for drilling Dual Phase Steel, 600MPa, (DP600) should be used.

Drill out the spot welds as indicated.

E111841

20. From inside the vehicle, drill out the spot welds as indicated.

E111842

21. Cut a window in the old panel, above the front door lower hinge reinforcement, to enable access to the spot welds as indicated.

E111843

22. NOTE: The spot welds indicated should be drilled right through, to enable MAG plug welding and a MIG braze slot on installation. The MIG braze slot is required as the original panel is MIG brazed in this area.

Drill out the spot welds as indicated.

E111843

23. Drill out the spot welds as indicated.

E111844

24. NOTE: Care should be taken not to cause damage to remaining panels when separating joints containing adhesive.

Separate the joints and remove the old panel, observing the areas of NVH component and adhesive as indicated.

E111845

Installation

1. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
2. With the new panel in position, mark the position of MAG plug welds as indicated.

3. Remove the new panel.

4. NOTE: In the area of the windshield wiper motor linkage mounting, there may not be access to spot weld. In this case, MAG plug welding is acceptable in this area.

Drill holes in the new panel ready for MAG plug welding.

5. Cut slots in the new panel as indicated.

E111848

6. NOTE: The MIG braze slot is required as the original panel is MIG brazed in this area.

Cut an elongated slot between the two drill outs in the A-pillar inner panel as indicated, ready for MIG brazing.

E111850

7. Prepare the old and new panel joint surfaces.
8. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
9. Remove the new panel.

10. NOTE: Make sure the adhesive does not encroach into the areas of the MAG plug welds as it will contaminate the weld.

Apply adhesive to the area as indicated.

E111851

11. Apply adhesive to the area as indicated.

E111852

12. Apply sealer adhesive to the NVH components as indicated.

E111853

13. Offer up, align and clamp the new panel into position.

14. Install the bolts as indicated.

- Tighten to 25 Nm.

E111839

15. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

E111854

16. MAG plug weld.

E111855

17. MIG Braze the slots.

E111856

18. MIG braze the elongated slot as indicated.

19. Dress all welded/brazed joints and remove any excess adhesive.

20. make sure any remaining areas of bare metal created during this procedure are treated with a zinc primer prior to the installation of outer panels.

21. Install the upper and lower NVH components as indicated.

22. When installing the A-pillar outer panel, the spot welded joint of the A-pillar reinforcement containing adhesive, should be spot welded in the same locations to allow a satisfactory weld.

23. The installation of associated panels and components is the reversal of removal procedure.

Side Panel Sheet Metal Repairs - B-Pillar Inner Panel

Removal and Installation

Removal

1. NOTE: The B-pillar inner panel is manufactured from mild steel.

The B-pillar inner panel is cut from the bodyside inner front section service panel.

E 112942

2. The B-pillar inner panel is replaced in conjunction with:

- Front door
- Rear door
- Rocker panel and B-pillar outer panel
- B-pillar reinforcement
- Rocker panel inner reinforcement
- Headliner

3. For additional information relating to this repair procedure please see the following:

For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) /

[Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) /

[Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) /

[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

4. Remove the rocker panel inner reinforcement.

For additional information, refer to: [Rocker Panel Inner Reinforcement](#) (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

5. Cut the old panel at the point indicated.

E 112946

6. Cut the old panel at the point indicated.

E 112947

7. Drill out the spot welds.

E 112943

8. NOTE: Care should be taken when separating and removing the old panel as it will be used as a template.

Carefully separate the joints and remove the old panel.

Installation

1. Cut a template from the old panel as indicated.

E 112954

2. NOTE: Dress the panel joint surfaces of the template to ensure a good fit.

Offer up, align and clamp the template into position on the new B-pillar inner panel. Cut along the edge of the template, through the new panel, at the point indicated where the MAG butt joint is to be made.

3. Remove the template from the new panel.

4. Using the old panel for reference and allowing for an overlap, cut the new panel at the point indicated.

5. Drill holes in the new panel ready for MAG plug welding.

6. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

7. Cut the new and old panels at the point indicated, where the lower MAG butt joint is to be made.

8. Remove the new B-pillar inner panel.
9. Prepare the old and new panel joint surfaces.

10. NOTE: Make sure the adhesive does not encroach into the area of MAG plug welds as it will contaminate the weld, (any unsealed areas must be sealed following the repair).

Apply weld through adhesive to the area as indicated.

E 112945

11. Offer up the new panel and clamp into position.
12. Tack MAG weld the butt joints.
13. Spot weld.

E 112950

14. Dress the tack welds.
15. MAG plug weld.

E 112949

16. MAG weld the upper butt joint.

E 112951

17. MAG weld the lower butt joint.

E 112952

18. Dress all welded joints.

19. Make sure any remaining areas of bare metal created during this procedure are treated with a zinc primer prior to the installation of other panels.

20. Make sure the joint between the B-pillar inner panel and the rocker panel inner panel is sealed following the completion of the B-pillar procedures.

21. The installation of associated panels and components is the reversal of removal procedure.

Side Panel Sheet Metal Repairs - B-Pillar Reinforcement

Removal and Installation

Removal

1. NOTE: The B-pillar reinforcement is manufactured from Dual Phase Steel, 450MPa, (DP450). It contains an internal boron reinforcement.

The B-pillar reinforcement panel is serviced as a separate weld-on panel. It is not serviced with its [NVH \(noise, vibration and harshness\)](#) components.

E107191

2. NOTE: The B-pillar reinforcement is spot welded to the cant rail reinforcement which is boron steel. In repair spot welds are replaced with MIG braze slots in these areas.

The b-pillar reinforcement is replaced in conjunction with:

1. Front door
 2. Rear door
 3. Rocker panel and B-pillar outer panel
 4. Headliner
3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the rocker panel and B-pillar outer panel.
For additional information, refer to: [Rocker Panel and B-Pillar Outer Panel](#) (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

5. Cut the old panel at the point indicated.

6. NOTE: A drill bit suitable for drilling boron should be used on the boron spot welds.

Drill out the spot welds.

7. NOTE: Care should be taken when separating and removing the old panel as it will be used as a template. Care should also be taken in the area of the NVH components.

Carefully separate the joints and remove the old panel.

Installation

1. Cut a template from the old panel, the cut should be made approx 10mm below the hole as indicated.

E107194

2. NOTE: Dress the panel joint surfaces of the template to ensure a good fit.

Offer up, align and clamp the template into position on the new B-pillar reinforcement panel. Cut along the edge of the template, through the new panel, at the point indicated, where the MAG butt joint is to be made.

E107195

3. Remove the template from the new panel.
4. Drill holes in the new panel ready for MAG plug welding.

E107196

5. Cut slots in the new panel ready for MIG braze slots.

E107197

6. **NOTE:** If necessary, renew the NVH components.

Prepare the old and new panel joint surfaces, including the NVH components.

7. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

8. Remove the new B-pillar reinforcement panel.

9. Apply sealer adhesive to the NVH components, as indicated.

E107198

10. Offer up the new panel and clamp into position.

11. Tack MAG weld the upper butt joint.

12. Install a tack MAG weld between the B-pillar reinforcement and the rocker panel inner reinforcement to secure the panel in position, to enable a final alignment check prior to welding.

13. **NOTE:** Temporarily install the rocker panel and B-pillar outer panel and the front and rear doors and hinges to aid alignment.

Check alignment, if correct, proceed to next step, if not, rectify and recheck before proceeding.

14. Remove the front and rear doors and hinges and the rocker panel and B-pillar outer panel.

15. Dress the tack welds.

16. MAG plug weld.

E 107199

17. MAG weld the upper butt joint.

E107200

18. MIG Braze the slots.

E 107201

19. Dress all welded/brazed joints.

20. Make sure any remaining areas of bare metal created during this procedure are treated with a zinc primer prior to the installation of outer panels.

21. The installation of associated panels and components is the reversal of removal procedure.

Side Panel Sheet Metal Repairs - Front Door Skin Panel

Removal and Installation

Removal

1. NOTE: The front door skin panel is manufactured from bake hardened steel, (220 MPa), plus zinc.

The front door skin panel is serviced as a separate panel.

E 103510

2. The front door skin panel is replaced in conjunction with:

1. Front door

3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the front door window regulator and motor.
For additional information, refer to: [Front Door Window Regulator and Motor](#) (501-11 Glass, Frames and Mechanisms, Removal and Installation).
5. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
6. Remove the exterior mirror.
For additional information, refer to: [Exterior Mirror](#) (501-09 Rear View Mirrors, Removal and Installation).
7. Remove the front door latch.
For additional information, refer to: [Front Door Latch](#) (501-14 Handles, Locks, Latches and Entry Systems, Removal and Installation).
8. Remove the front door outer window frame mouldings.
9. Remove the front door weatherstrips.
10. Remove the front door wiring harness.
11. Remove the front door impact absorbers.
12. Remove the front door glass run felt.
13. Disconnect the front door wiring harness, accessed behind the grommet on the A-pillar.
14. Remove the screw and release the front door check strap from the body.
15. Remove the front door.

E103517

16. Abrade the areas of folded flange on the old front door skin panel.

E 103511

17. Separate the adhesive and remove the bulk of the old panel.

18. Separate and remove the old panel remnants from the front door frame.

Installation

1. Prepare the old and new panel joint surfaces.
2. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
3. Remove the new panel.

4. Apply adhesive to the areas of folded flange as indicated.

E 103512

5. Apply adhesive to the impact beam/reinforcements as indicated.

E 103513

6. Offer up the new panel, align and clamp into position.

7. Fold the flange of the front door skin panel, over the front door frame as indicated.

E 103516

8. NOTE: There is access to apply the expanding foam sealer with the front door skin panel fitted to the front door frame.

Apply expanding foam sealer to the area indicated.

E 103514

9. Remove any excess adhesive or expanding foam sealer.

10. Dress the folded flange joints.

11. Install the front door.

- Tighten to 30 Nm.

E103517

12. Check alignment, if correct, proceed to next step, if not rectify before proceeding.

13. Install the NVH (noise, vibration and harshness) components.

E 103515

14. NOTE: Install the front door upper frame weatherstrip prior to installing the front door.

The installation of associated panels and components is the reversal of removal procedure.

Side Panel Sheet Metal Repairs - Rear Door Skin Panel

Removal and Installation

Removal

1. NOTE: The rear door skin panel is manufactured from bake hardened steel, (220 MPa), plus zinc

The rear door skin panel is serviced as a separate panel.

E 103519

2. The rear door skin panel is replaced in conjunction with:
 1. Rear door
3. For additional information relating to this repair procedure please see the following:
 For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) /
[Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) /
[Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the rear door window regulator and motor.
 For additional information, refer to: [Rear Door Window Regulator and Motor](#) (501-11 Glass, Frames and Mechanisms, Removal and Installation).
5. Disconnect the battery ground cable.
 For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
6. Remove the rear door latch.
 For additional information, refer to: [Rear Door Latch](#) (501-14 Handles, Locks, Latches and Entry Systems, Removal and Installation).
7. Remove the rear door outer window frame mouldings.
8. Remove the rear door weatherstrips.
9. Remove the rear door wiring harness.
10. Remove the rear door impact absorbers.
11. Remove the rear door glass run felt.
12. Disconnect the rear door wiring harness, accessed behind the grommet on the B-pillar.
13. Remove the screw and release the rear door check strap from the body.
14. Remove the rear door.

E103525

15. Abrade the areas of folded flange on the old rear door skin panel.

E 103520

16. Separate the adhesive and remove the bulk of the old panel.

17. Separate and remove the old panel remnants from the rear door frame.

Installation

1. Prepare the old and new panel joint surfaces.
2. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
3. Remove the new panel.

4. Apply adhesive to the areas of folded flange as indicated.

E 103521

5. Apply adhesive to the impact beam/reinforcements as indicated.

E 103522

6. Offer up the new panel, align and clamp into position.

7. Fold the flange of the rear door skin panel, over the rear door frame as indicated.

E 103524

8. Remove any excess adhesive.
9. Dress the folded flange joints.
10. Install the rear door.
 - Tighten to 30 Nm.

11. Check alignment, if correct, proceed to next step, if not rectify before proceeding.
12. Install the **NVH (noise, vibration and harshness)** components.

13. The installation of associated panels and components is the reversal of removal procedure.

Side Panel Sheet Metal Repairs - Rocker Panel

Removal and Installation

Removal

1. **NOTE:** The rocker panel is manufactured from mild steel.

The rocker panel is serviced as a separate weld-on panel. It is not serviced with its riv-nuts for the fender fixings, or **NVH** (noise, vibration and harshness) components.

E102794

2. The rocker panel is replaced in conjunction with:
 1. Front fender
 2. Front door
 3. Rear door
3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) /
[Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) /
[Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
5. Disconnect the generator electrical connectors.
6. Remove the rear seat cushion.
For additional information, refer to: [Rear Seat Cushion](#) (501-10 Seating, Removal and Installation).
7. Remove the front and rear door weatherstrips.
8. Remove the cowl side trim panel.
For additional information, refer to: [Cowl Side Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
9. Remove the front safety belt retractor.
For additional information, refer to: [Front Safety Belt Retractor](#) (501-20A Safety Belt System, Removal and Installation).
10. Remove the B-pillar side impact sensor.
For additional information, refer to: [B-Pillar Side Impact Sensor](#) (501-20B Supplemental Restraint System, Removal and Installation).
11. Remove the C-pillar side impact sensor.
For additional information, refer to: [C-Pillar Side Impact Sensor](#) (501-20B Supplemental Restraint System, Removal and

Installation).

12. Release and position the floor covering to one side.
13. Release and position the inner rocker panel wiring harness to one side.
14. Remove the rear wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
15. Remove the rear fender splash shield.

16. Remove the rocker panel outer moulding.
17. Remove the underfloor splash shield.
18. If the right-hand rocker panel is to be repaired, release and position the underfloor wiring harness to one side.
19. Remove the front fender.
For additional information, refer to: [Front Fender](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).
20. Remove the front door.
For additional information, refer to: [Front Door](#) (501-03 Body Closures, Removal and Installation).
21. Remove the rear door.
For additional information, refer to: [Rear Door](#) (501-03 Body Closures, Removal and Installation).
22.  **CAUTION:** Care should be taken not to cut through into the inner panels.

Using the new panel for reference and allowing for an overlap, cut the old panel at the points indicated.

E 102795

23. Drill out the spot welds.

E 102796

24. Separate the joints and remove the bulk of the old panel.

Installation

1. Install the riv-nuts into the new rocker panel as indicated.

E102797

2.  CAUTION: Care should be taken not to cut through into the inner panels.

Offer up, align and clamp the new panel into position, overlapping the old panel remnant. Cut through the new panel, partially cutting the old panel at the points where the MAG butt joints are to be made.

E 102798

3. Remove the new panel.
4. Cut and remove the old panel remnants.
5. Drill holes in the new panel ready for MAG plug welding.

E 102799

6. NOTE: If necessary renew the NVH components.

Prepare the old and new panel joint surfaces, including the NVH components.

7. NOTE: Temporarily install the front and rear doors and front fender to aid alignment.

Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

8. Remove the front and rear doors, front fender and the new rocker panel.

9. NOTE: Make sure the adhesive does not encroach into the area of the butt joint as it will contaminate the weld (any unsealed areas must be sealed following the repair).

Apply adhesive to the area as indicated.

E 102801

10. Apply sealer adhesive to the NVH components as indicated.

E 102800

11. Offer up the new rocker panel, align and clamp into position.

12. Tack weld the butt joints.

13. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original

joint, spot welds should be installed through the original.

Spot weld.

E 102802

14. MAG plug weld.

E 102799

15. Dress the tack welds.

16. MAG weld the butt joints.

E 102803

17. Dress all welded joints.

18. The joint between the rocker panel and A-pillar must be sealed following the repair as indicated.

E102812

19. The installation of associated panels and components is the reversal of removal procedure.

Side Panel Sheet Metal Repairs - Rocker Panel and B-Pillar Outer Panel

Removal and Installation

Removal

1. NOTE: The rocker panel and B-pillar outer panel is manufactured from mild steel.

The rocker panel and B-pillar outer panel is serviced as a separate weld-on panel. It is not serviced with its NVH (noise, vibration and harshness) components.

E104782

2. NOTE: The rocker panel and B-pillar outer panel is spot welded to the cant rail reinforcement which is boron steel. In repair spot welds are replaced with MIG braze and MIG braze slots in these areas.

The rocker panel and B-pillar outer panel is replaced in conjunction with:

1. Front door
 2. Rear door
 3. B-pillar reinforcement
 4. Headliner
3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
5. Disconnect the generator electrical connectors.

6. Remove the right-hand and left-hand front scuff plate trim panels.
For additional information, refer to: [Front Scuff Plate Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
7. Remove the front and rear door weatherstrips.
8. Remove the right-hand and left-hand rear scuff plate trim panels.
For additional information, refer to: [Rear Scuff Plate Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
9. Remove the headliner.
For additional information, refer to: [Headliner](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
10. Remove the side air curtain module.
For additional information, refer to: Side Air Curtain Module (501-20B, Removal and Installation).
11. Remove the rear seat cushion.
For additional information, refer to: [Rear Seat Cushion](#) (501-10 Seating, Removal and Installation).
12. Remove the rear seat backrest.
13. Release and position the roof wiring harness to one side.
14. Remove the roof moulding.
15. Remove the cowl side trim panel.
For additional information, refer to: [Cowl Side Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
16. Remove the front safety belt retractor.
For additional information, refer to: [Front Safety Belt Retractor](#) (501-20A Safety Belt System, Removal and Installation).
17. Remove the B-pillar side impact sensor.
For additional information, refer to: [B-Pillar Side Impact Sensor](#) (501-20B Supplemental Restraint System, Removal and Installation).
18. Remove the C-pillar side impact sensor.
For additional information, refer to: [C-Pillar Side Impact Sensor](#) (501-20B Supplemental Restraint System, Removal and Installation).
19. Release and position the floor covering to one side.
20. Release and position the inner rocker panel wiring harness to one side.
21. Remove the rear wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
22. NOTE: Right-hand shown, left-hand similar.

Remove the rear fender splash shield.

E100538

23. Remove the rocker panel outer moulding.
24. Remove the underfloor splash shield.
25. If the right-hand rocker panel is to be repaired, release and position the underfloor wiring harness to one side.

26. Remove the front door.
For additional information, refer to: [Front Door](#) (501-03 Body Closures, Removal and Installation).
27. Remove the rear door.
For additional information, refer to: [Rear Door](#) (501-03 Body Closures, Removal and Installation).
28. Remove the rear door upper and lower hinges from the B-pillar.
29. Measure and mark out a section on the B-pillar upper, on the vehicle as indicated.

E104783

E 104784

30.  CAUTION: Care should be taken not to cut through into the inner panels.

• NOTE: A drill bit suitable for drilling boron should be used on the 4 upper boron spot welds.

Cut the section of the B-pillar upper at the points indicated and drill out the spot welds.

31. NOTE: Care should be taken when separating and removing the section as it will be used as a template.

Carefully separate the section of the B-pillar upper and remove.

32. NOTE: Dress the panel joint surfaces of the template to make sure it is a good fit.

Offer up, align and clamp the template into position on the new rocker panel and B-pillar outer panel. Cut around the edge of the template, through the new rocker panel and B-pillar outer panel at the points indicated, where the MIG brazed butt joint is to be made.

E104788

33. Remove the template from the new panel.

34. NOTE: This procedure shows the rocker panel part of the rocker panel and B-pillar outer panel being installed to its service condition. The rocker panel lower butt joints could be performed closer to the B-pillar, dependant on the extent of the damage.

Using the new panel for reference and allowing for an overlap, cut the old panel at the points indicated.

E104785

35. Drill out the spot welds.

E104787

36. Separate the joints and remove the bulk of the old panel.

Installation

1.  CAUTION: Care should be taken not to cut through into the inner panels.

• NOTE: Temporarily install the front door and the rear door and hinges, to aid alignment.

Offer up, align and clamp the new panel into position, overlapping the old panel remnant. Cut through the new panel, partially cutting the old panel at the points where the MAG butt joints are to be made.

E104789

2. Remove the front door and the rear door and hinges and the new rocker panel and B-pillar outer panel.
3. Cut and remove the old panel remnants.
4. Drill holes in the new panel ready for MAG plug welding.

E104795

5. Cut slots in the new panel ready for MIG braze slots.

E104791

6. NOTE: If necessary, renew the NVH component.

Prepare the old and new panel joint surfaces, including the NVH component.

7. NOTE: Temporarily install the front door and the rear door and hinges, to aid alignment.

Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not, rectify and recheck before proceeding.

8. Remove the front door and the rear door and hinges and the new rocker panel and B-pillar outer panel.

9. NOTE: Make sure the adhesive does not encroach into the area of the butt joint as it will contaminate the weld (any unsealed areas must be sealed following the repair).

Apply adhesive to the area as indicated.

E 104790

10. Apply sealer adhesive to the NVH component as indicated.

E104794

11. Offer up the new rocker panel and B-pillar outer panel, align and clamp into position.
12. Tack MIG braze the upper butt joint.
13. Tack MAG weld the lower butt joints.
14. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

E104793

15. MAG plug weld.

E104795

16. MIG Braze the slots.

E104791

17. Dress the tack welds/braze.

18. MIG braze the upper butt joint.

E104792

19. MAG weld the lower butt joints.

E104786

20. Dress all welded/brazed joints.

21. The installation of associated panels and components is the reversal of removal procedure.

Side Panel Sheet Metal Repairs - Rocker Panel Front Section

Removal and Installation

Removal

1. **NOTE:** The rocker panel front section is manufactured from mild steel.

The rocker panel front section is cut from the rocker panel service panel. It is not serviced with its riv-nuts for the fender fixings, or **NVH (noise, vibration and harshness)** components.

E102804

2. The rocker panel front section is replaced in conjunction with:
 1. Front fender
 2. Front door
 3. Rear door
3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the front seat.
For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
5. Disconnect the generator electrical connectors.
6. Remove the rear seat cushion.
For additional information, refer to: [Rear Seat Cushion](#) (501-10 Seating, Removal and Installation).
7. Remove the front and rear door weatherstrips.
8. Remove the cowl side trim panel.
For additional information, refer to: [Cowl Side Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
9. Remove the front safety belt retractor.
For additional information, refer to: [Front Safety Belt Retractor](#) (501-20A Safety Belt System, Removal and Installation).
10. Remove the B-pillar side impact sensor.
For additional information, refer to: [B-Pillar Side Impact Sensor](#) (501-20B Supplemental Restraint System, Removal and Installation).
11. Remove the C-pillar side impact sensor.
For additional information, refer to: [C-Pillar Side Impact Sensor](#)

(501-20B Supplemental Restraint System, Removal and Installation).

12. Release and position the floor covering to one side.
13. Release and position the inner rocker panel wiring harness to one side.
14. Remove the rocker panel outer moulding.
15. Remove the underfloor splash shield.
16. If the right-hand rocker panel front section is to be repaired, release and position the underfloor wiring harness to one side.
17. Remove the front fender.
For additional information, refer to: [Front Fender](#) (501-27 Front End Sheet Metal Repairs, Removal and Installation).
18. Remove the front door.
For additional information, refer to: [Front Door](#) (501-03 Body Closures, Removal and Installation).
19. Remove the rear door.
For additional information, refer to: [Rear Door](#) (501-03 Body Closures, Removal and Installation).
20. Cut the new rocker panel front section from the new rocker panel service panel.

E102808

21.  **CAUTION:** Care should be taken not to cut through into the inner panels.

Using the new panel for reference and allowing for an overlap, cut the old panel at the points indicated.

E102805

22. Drill out the spot welds.

E102806

23. Separate the joints and remove the bulk of the old panel.

Installation

1. Install the riv-nuts into the new rocker panel front section as indicated.

E102807

2.  CAUTION: Care should be taken not to cut through into the inner panels.

Offer up, align and clamp the new panel into position, overlapping the old panel remnant. Cut through the new panel, partially cutting the old panel, at the points where the MAG butt joints are to be made.

E102809

3. Remove the new panel.
4. Cut and remove the old panel remnants.
5. Drill holes in the new panel ready for MAG plug welding.

E102810

6. NOTE: If necessary renew the NVH components.

Prepare the old and new panel joint surfaces, including the NVH components.

7. NOTE: Temporarily install the front and rear doors and front fender to aid alignment.

Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not, rectify and recheck before proceeding.

8. Remove the front and rear doors, front fender and the new rocker panel front section.

9. Apply sealer adhesive to the NVH components as indicated.

E102811

10. Offer up the new rocker panel front section, align and clamp into position.

11. Tack weld the butt joints.

12. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

E 102813

13. MAG plug weld.

E102810

14. Dress the tack welds.
15. MAG weld the butt joints.

E102814

16. Dress all welded joints.

17. The joint between the rocker panel and A-pillar must be sealed following the repair as indicated.

E102812

18. The installation of associated panels and components is the reversal of removal procedure.

Side Panel Sheet Metal Repairs - Rocker Panel Inner Reinforcement

Removal and Installation

Removal

1. NOTE: The rocker panel inner reinforcement is manufactured from Dual Phase Steel, 600MPa, (DP600).

The rocker panel inner reinforcement is serviced as a separate weld-on panel. This procedure defines the rocker panel inner reinforcement to be sectioned to enable fitment of the B-pillar inner panel.

E107660

2. The rocker panel inner reinforcement is replaced in conjunction with:

1. Front door
2. Rear door
3. Rocker panel and B-pillar outer panel
4. B-pillar reinforcement
5. Headliner

3. For additional information relating to this repair procedure please see the following:

For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).

4. Remove the B-pillar reinforcement.

For additional information, refer to: [B-Pillar Reinforcement](#) (501-29 Side Panel Sheet Metal Repairs, Removal and Installation).

5. NOTE: When replaced in association with other inner and outer panel sections, make sure there is always a minimum 50mm staggered joint between every section.

Cut the old panel at the point indicated.

E107661

6. NOTE: A drill bit suitable for drilling DP600 should be used.

- NOTE: There are spot welds located under the adhesive residue left by the removal of the B-pillar reinforcement.

Drill out the spot welds.

E107662

7. Using a belt sander, release the rocker panel inner reinforcement from the MAG welds at the points indicated.

E107663

8. Separate the joints and remove the old panel.

Installation

1. Cut a short section from the front end of the old panel, to be used as a template.

E107664

2. NOTE: Dress the panel joint surfaces of the template to ensure a good fit.

Offer up, align and clamp the template into position on the new rocker panel inner reinforcement. Cut along the edge of the template, through the new panel, at the point indicated, where the MAG butt joint is to be made.

E107665

3. Remove the template from the new panel.
4. Drill holes in the new panel ready for MAG plug welding.

E107666

5. Prepare the old and new panel joint surfaces.
6. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
7. Remove the new rocker panel inner reinforcement.
8. **NOTE:** Make sure the adhesive does not encroach into the areas of the MAG plug welds or butt joint as it will contaminate the weld.

Apply adhesive to the area, as indicated.

9. Apply adhesive to the area, as indicated.

E107668

10. Offer up the new panel, align and clamp into position.

11. MAG tack weld the butt joint.

12. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

E107669

13. MAG plug weld.

E107670

14. Dress the tack welds.

15. MAG weld the butt joint.

E107671

- 16.** Dress all welded joints.
- 17.** Make sure any remaining areas of bare metal created during this procedure are treated with a zinc primer prior to the installation of outer panels.
- 18.** The installation of associated panels and components is the reversal of removal procedure.

Side Panel Sheet Metal Repairs - Rocker Panel Rear Section

Removal and Installation

Removal

1. **NOTE:** The rocker panel rear section is manufactured from mild steel.

The rocker panel rear section is cut from the rocker panel service panel. It is not serviced with its **NVH (noise, vibration and harshness)** components.

E102815

2. The rocker panel rear section is replaced in conjunction with:
 1. Front door
 2. Rear door
3. For additional information relating to this repair procedure please see the following:
 For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) /
[Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) /
[Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) /
[Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the front seat.
 For additional information, refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).
5. Disconnect the generator electrical connectors.
6. Remove the rear seat cushion.
 For additional information, refer to: [Rear Seat Cushion](#) (501-10 Seating, Removal and Installation).
7. Remove the front and rear door weatherstrips.
8. Remove the cowl side trim panel.
 For additional information, refer to: [Cowl Side Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
9. Remove the front safety belt retractor.
 For additional information, refer to: [Front Safety Belt Retractor](#) (501-20A Safety Belt System, Removal and Installation).
10. Remove the B-pillar side impact sensor.
 For additional information, refer to: [B-Pillar Side Impact Sensor](#) (501-20B Supplemental Restraint System, Removal and Installation).
11. Remove the C-pillar side impact sensor.
 For additional information, refer to: [C-Pillar Side Impact Sensor](#) (501-20B Supplemental Restraint System, Removal and Installation).

12. Release and position the floor covering to one side.
13. Release and position the inner rocker panel wiring harness to one side.
14. Remove the rear wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
15. Remove the rear fender splash shield.

16. Remove the rocker panel outer moulding.
17. Remove the underfloor splash shield.
18. If the right-hand rocker panel rear section is to be repaired, release and position the underfloor wiring harness to one side.
19. Remove the front door.
For additional information, refer to: [Front Door](#) (501-03 Body Closures, Removal and Installation).
20. Remove the rear door.
For additional information, refer to: [Rear Door](#) (501-03 Body Closures, Removal and Installation).
21. Cut the new rocker panel rear section from the new rocker panel service panel.

22.  **CAUTION:** Care should be taken not to cut through into the inner panels.

Using the new panel for reference and allowing for an overlap, cut the old panel at the points indicated.

E102816

23. Drill out the spot welds.

E102817

24. Separate the joints and remove the bulk of the old panel.

Installation

1.  CAUTION: Care should be taken not to cut through into

the inner panels.

Offer up, align and clamp the new panel into position, overlapping the old panel remnant. Cut through the new panel, partially cutting the old panel, at the points where the MAG butt joints are to be made.

E102819

2. Remove the new panel.
3. Cut and remove the old panel remnants.
4. Drill holes in the new panel ready for MAG plug welding.

E102820

5. NOTE: If necessary renew the NVH components.

Prepare the old and new panel joint surfaces, including the NVH components.

6. NOTE: Temporarily install the front and rear doors to aid alignment.

Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.

7. Remove the front and rear doors and the new rocker panel rear section.

8. NOTE: Make sure the adhesive does not encroach into the area of the butt joint as it will contaminate the weld (any unsealed areas must be sealed following the repair).

Apply adhesive to the area as indicated.

E102822

9. Apply sealer adhesive to the NVH components as indicated.

E102821

10. Offer up the new rocker panel rear section, align and clamp into position.

11. Tack weld the butt joints.

12. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

E102823

13. MAG plug weld.

E102820

14. Dress the tack welds.
15. MAG weld the butt joints.

E 102824

16. Dress all welded joints.

17. The installation of associated panels and components is the reversal of removal procedure.

Rear End Sheet Metal Repairs - Back Panel

Removal and Installation

Removal

1. **NOTE:** The back panel is manufactured from mild steel.

The back panel is serviced as a separate weld-on panel, it includes the back panel inner, right-hand and left-hand rear bumper mountings, it also includes its weld studs.

E101451

2. The back panel is replaced in conjunction with:
 - Rear bumper cover
 - Rear bumper
3. For additional information relating to this repair procedure please see the following: [Health and Safety Precautions](#) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the rear bumper.
For additional information, refer to: [Rear Bumper](#) (501-19 Bumpers, Removal and Installation).
5. Remove the battery.
For additional information, refer to: [Battery](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
6. Remove the battery tray.
7. Disconnect the generator electrical connectors.
8. Remove the loadspace left-hand trim panel.
For additional information, refer to: [Loadspace Trim Panel LH](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
9. Remove any electrical components in the local area of repair to prevent damage.
10. Remove the auxiliary junction box (AJB).
For additional information, refer to: [Auxiliary Junction Box \(AJB\)](#) (418-00, Removal and Installation).
11. Release the external back panel wiring harness and pull through into the loadspace.
12. Remove the luggage compartment lid weatherstrip.
13. Remove the loadspace trim panel.
For additional information, refer to: [Loadspace Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

14. Remove the spare wheel and tire (if equipped).

15. Remove the subwoofer speaker (if equipped).

16. Release and position the back panel and loadspace wiring harness to one side.

17. Remove the luggage compartment latch striker.

18. Remove the right-hand and left-hand forced air extraction grilles.

19. Remove the right-hand and left-hand muffler and tailpipe. For additional information, refer to: Muffler and Tailpipe (309-00A, Removal and Installation) / Muffler and Tailpipe (309-00B, Removal and Installation) / Muffler and Tailpipe (309-00C, Removal and Installation).

20. Remove the right-hand and left-hand muffler and tailpipe heatshield.

21. NOTE: Where applicable spot welds must be drilled from the inside, this will enable the new panel to be spot welded on installation. The lowest spot weld to the quarter panel lower extension has to be drilled from outside and MAG plug welded on installation.

Drill out the spot welds.

E101452

22. Separate the joints and remove the old panel.

Installation

1. Prepare the old and new panel joint surfaces.
2. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
3. Remove the new panel.
4. Apply adhesive to the areas indicated.

E101454

5. Offer up the new panel and clamp into position.

6. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

E101455

7. MAG Plug weld.

E101456

8. Dress all welded joints and remove any excess adhesive.

9. The installation of associated panels and components is the reversal of removal procedure.

Rear End Sheet Metal Repairs - Quarter Panel

Removal and Installation

Removal

1. NOTE: The quarter panel is manufactured from mild steel.

The quarter panel is serviced as a separate weld-on panel, it includes the quarter panel lower extension, rear lamp mounting panel, rear lamp mounting panel insert, water drain panel and the door striker reinforcement. It is not serviced with its weld studs, or NVH (noise, vibration and harshness) components.

E101668

2. The quarter panel is replaced in conjunction with:
 1. Rear bumper
 2. Rear bumper cover
 3. Luggage compartment lid
 4. Rear window glass
 5. Headliner
3. For additional information relating to this repair procedure please see the following:
For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the rear wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
5. Remove the rear fender splash shield.

E100538

6. Remove the Rear Bumper.
For additional information, refer to: [Rear Bumper](#) (501-19 Bumpers, Removal and Installation).

7. Remove the battery.
For additional information, refer to: [Battery](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
8. Disconnect the generator electrical connectors.
9. If the left-hand rear quarter panel is to be repaired, remove the loadspace left-hand trim panel.
For additional information, refer to: [Loadspace Trim Panel LH](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
10. If the right-hand rear quarter panel is to be repaired, remove the auxiliary junction box (AJB).
For additional information, refer to: Auxiliary Junction Box (AJB) (418-00 Module Communications Network, Removal and Installation).
11. Remove any electrical components in the local area of repair to prevent damage.
12. Remove the rear muffler.
For additional information, refer to: Rear Muffler (309-00A, Removal and Installation) / Rear Muffler (309-00C, Removal and Installation) / [Rear Muffler](#) (309-00 Exhaust System - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
13. Remove the exhaust muffler and tailpipe heatshield.
14. Remove the rear scuff plate trim panel.
For additional information, refer to: [Rear Scuff Plate Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
15. Remove the loadspace trim panel.
For additional information, refer to: [Loadspace Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
16. Remove the forced air extraction grille.
17. Release and lay aside the back panel and loadspace wiring harness.
18. Remove the luggage compartment lid weatherstrip.
19. Remove the rear bumper cover side retainer.
20. Remove the roof moulding.
21. Remove the headliner.
For additional information, refer to: [Headliner](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
22. Remove the side air curtain module.
For additional information, refer to: Side Air Curtain Module (501-20 Supplemental Restraint System, Removal and Installation).
23. Remove the rear window glass.
24. Remove the audio unit antenna amplifier.
For additional information, refer to: [Audio Unit Antenna Amplifier](#) (415-01 Information and Entertainment System, Removal and Installation).
25. If the left-hand rear quarter panel is to be repaired, remove the diversity antenna module.
26. Remove the C-Pillar side impact sensor.
For additional information, refer to: [C-Pillar Side Impact Sensor](#) (501-20B Supplemental Restraint System, Removal and Installation).
27. Remove the rear door striker.
28. Remove the luggage compartment lid.
29. If the right-hand rear quarter panel is to be repaired, drain the fuel tank.
For additional information, refer to: [Fuel Tank Draining](#) (310-00 Fuel System - General Information, General Procedures).
30. If the right-hand rear quarter panel is to be repaired, remove the fuel filler door.
31. If the right-hand rear quarter panel is to be repaired, remove the fuel tank filler pipe.
For additional information, refer to: Fuel Tank Filler Pipe (310-01 Fuel Tank and Lines - 3.0L, Removal and Installation) / [Fuel Tank Filler Pipe](#) (310-01 Fuel Tank and Lines - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

32. Remove the luggage compartment lid hinge.

33. NOTE: The upper butt joint must be performed below the 4 metal thickness parts of the door and rear window apertures, (to enable spot welding back).

Cut the old panel at the points illustrated, allowing for overlap, ensuring the final cut is performed below the 4 metal thickness parts of the door and rear window aperture.

34. NOTE: This procedure assumes that the door striker reinforcement panel is undamaged. In this case, the original remains on the vehicle and the new door striker reinforcement panel is removed from the quarter panel service panel and discarded.

Drill out the spot weld.

35. NOTE: Use a belt sander where there is no access to drill.

Drill out the spot welds.

E101672

36. Separate the joints and remove the old panel, also releasing the [NVH](#) components.

Installation

1. NOTE: This procedure assumes that the door striker reinforcement panel is undamaged. In this case, the original remains on the vehicle and the new door striker reinforcement panel is removed from the quarter panel service panel and discarded.

Remove the door striker reinforcement panel from the quarter panel service panel.

2. Trim the excess from the upper part of the service panel.

3. Prepare the old and new panel joint surfaces, including the [NVH](#) components.

4. NOTE: Temporarily install the luggage compartment lid and hinge to aid alignment.

Offer up, align and clamp into position, overlapping the old panel. Cut the new and old panels at the points where the MAG butt joints are to be made.

5. Remove the new panel, the luggage compartment lid and the old panel.

6. Where applicable, drill holes in the new panel ready for MAG plug welding.

7. Apply adhesive to the areas indicated.

8. If necessary, renew the NVH components.

9. Apply sealer adhesive to the NVH components.

E101678

10. NOTE: Temporarily install the luggage compartment lid and hinge to aid alignment.

Offer up the new panel, align and clamp into position.

11. Tack weld the butt joints.

12. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

13. MAG plug weld.

14. MAG plug weld the new panel to the door striker reinforcement panel.

15. Dress the tack welds.

16. MAG weld the butt joints.

17. NOTE: Stud dimensions: 6mm x 1.0mm thread, 20mm length.

Prepare the new panel and install the weld studs as indicated.

E101497

18. Dress all welded joints and remove any excess adhesive.
19. The installation of associated panels and components is the reversal of removal procedure.

Rear End Sheet Metal Repairs - Quarter Panel Lower Extension

Removal and Installation

Removal

1. NOTE: The Quarter Panel Lower Extension is manufactured from mild steel.

The quarter panel lower extension is serviced as a separate weld-on panel, it is also serviced on the quarter panel. It is serviced without weld studs.

E101492

2. The quarter panel lower extension is replaced in conjunction with:
 1. Rear bumper cover
 2. Rear bumper
3. For additional information relating to this repair procedure please see the following:
 For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Remove the battery.
 For additional information, refer to: [Battery](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
5. Disconnect the generator electrical connectors.
6. Remove any electrical components in the local area of repair to prevent damage.
7. Remove the Rear Bumper.
 For additional information, refer to: [Rear Bumper](#) (501-19 Bumpers, Removal and Installation).
8. Remove the rear muffler.
 For additional information, refer to: [Rear Muffler](#) (309-00A, Removal and Installation) / [Rear Muffler](#) (309-00C, Removal and Installation) / [Rear Muffler](#) (309-00 Exhaust System - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
9. Remove the exhaust muffler and tailpipe heatshield.
10. Remove the forced air extraction grille.
11. Release and lay aside the back panel and loadspace wiring harness.
12. Remove the rear bumper cover side retainer.
13. Remove the rear wheel and tire.
 For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

14. Remove the rear fender splash shield.

15. NOTE: Where applicable spot welds must be drilled from the inside, this will enable the new panel to be spot welded on installation. Use a belt sander where there is no access to drill.

Drill out the spot welds.

E101493

16. Separate the joints and remove the old panel.

Installation

1. Prepare the old and new panel joint surfaces.
2. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not rectify and recheck before proceeding.
3. Remove the new panel.

4. Apply adhesive to the areas indicated.

5. Offer up the new panel and clamp into position.

6. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

7. MAG plug weld.

8. NOTE: Stud dimensions: 6mm x 1.0mm thread, 20mm length.

Prepare the new panel and install the weld studs as indicated.

E101497

9. Dress all welded joints and remove any excess adhesive.
10. The installation of associated panels and components is the reversal of removal procedure.

Rear End Sheet Metal Repairs - Rear Bumper Mounting

Removal and Installation

Removal

1. **NOTE:** The rear bumper mounting is manufactured from mild steel.

The rear bumper mounting is serviced on the back panel and must be removed from this to carry out this procedure.

E101457

2. The rear bumper mounting is replaced in conjunction with:
 - Rear bumper cover
 - Rear bumper
3. For additional information relating to this repair procedure please see the following:
 For additional information, refer to: [Health and Safety Precautions](#) (100-00 General Information, Description and Operation) / [Body Repairs](#) (501-25A Body Repairs - General Information, Description and Operation) / [Corrosion Protection](#) (501-25B Body Repairs - Corrosion Protection, Description and Operation) / [Body and Frame](#) (501-26 Body Repairs - Vehicle Specific Information and Tolerance Checks, Description and Operation).
4. Disconnect the battery ground cable.
 For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
5. If the right-hand rear bumper mounting is to be repaired, remove the battery.
 For additional information, refer to: [Battery](#) (414-01 Battery, Mounting and Cables, Removal and Installation).
6. If the right-hand rear bumper mounting is to be repaired, remove the battery tray.
7. Disconnect the generator electrical connectors.
8. Remove the rear bumper.
 For additional information, refer to: [Rear Bumper](#) (501-19 Bumpers, Removal and Installation).
9. Remove any electrical components in the local area of repair to prevent damage.
10. If the right-hand rear bumper mounting is to be repaired, remove the auxiliary junction box (AJB).
 For additional information, refer to: [Auxiliary Junction Box \(AJB\)](#) (418-00, Removal and Installation).
11. Release the external back panel wiring harness and pull through into the loadspace.
12. Remove the luggage compartment lid weatherstrip.

13. Remove the spare wheel and tire (if equipped).

14. Remove the subwoofer speaker (if equipped).

15. Release and position the back panel and loadspace wiring harness to one side.

16. Remove the right-hand or left-hand muffler and tailpipe as necessary.

For additional information, refer to: Muffler and Tailpipe (309-00A, Removal and Installation) / Muffler and Tailpipe (309-00B, Removal and Installation) / Muffler and Tailpipe (309-00C, Removal and Installation).

17. Remove the right-hand or left-hand muffler and tailpipe heatshield as necessary.

18. Drill out the spot welds.

19. Separate the joints and remove the old panel.

Installation

1. NOTE: Spot welds must be drilled from the inside, this will enable the new panel to be spot welded on installation.

Drill the rear bumper mounting off the back panel service panel.

E101459

2. Prepare the old and new panel joint surfaces.
3. Offer up the new panel and clamp into position. Check alignment, if correct, proceed to next step, if not, rectify and recheck before proceeding.

4. NOTE: Spot welds must be installed 5mm away from the originals and in the same quantities, whenever this is possible. Where this is not possible, spot welds should be installed adjacent to the original. Where there is adhesive in the original joint, spot welds should be installed through the original.

Spot weld.

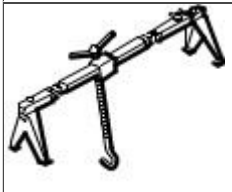

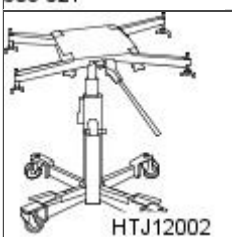

E101458

5. Dress all welded joints.
6. The installation of associated panels and components is the reversal of removal procedure.

Uni-Body, Subframe and Mounting System - Front Subframe TDV6 2.7L Diesel

Removal and Installation

Special Tool(s)	
 <p>502-005</p>	<p>Subframe Alignment Bolt</p> <p>502-005</p>
 <p>E54554</p>	<p>Lifting Brackets - Engine</p> <p>303-1129</p>

 <p>HTJ12002</p>	<p>Power train assembly jack</p> <p>HTJ1200-2</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Using suitable tie straps, secure the radiator.

3. Remove the intake air shutoff throttle.
For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).
4. Install the special tool.

5. Install the special tool.

6. Raise and support the vehicle.

7. Remove both the front wheels and tires.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

8. Remove the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

9. Remove the radiator splash shield.

For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

10. Detach the transmission fluid cooler.

- Tie aside.

11. Remove the right-hand splash shield.

12. Detach the engine coolant inlet pipe from the front subframe.

13. Detach the power steering hose retaining clip from the front subframe.

E52478

14. NOTE: Left-hand shown, right-hand similar.

Remove the stabilizer bar link upper retaining nut.

VUJ0005261

15. NOTE: Left-hand shown, right-hand similar.

Remove the stabilizer bar link lower retaining bolt and nut and remove the stabilizer bar link.

VUJ0005262

16. Detach the steering gear.

- Secure the steering gear.

VUJ0005142

17. NOTE: Left-hand shown, right-hand similar.

Release the front lower arm and position it to one side.

- Mark the position of the bolt.

VUJ0005102

18. NOTE: Left-hand shown, right-hand similar.

Release the rear lower arm and position it to one side.

VUJ0005104

19. NOTE: Left-hand shown, right-hand similar.

Remove the engine mount retaining nut.

VUJ0005532

20. Install the special tool to the front subframe.

E31131

21. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe front retaining bolt.

E31132

22. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe rear retaining bolt.

E31275

23. Remove the front subframe.

Installation

1. Install the front subframe.

2. NOTE: Left-hand shown, right-hand similar.

Install the special tool.

3. NOTE: Left-hand shown, right-hand similar.

Install the front subframe rear retaining bolt.

- Tighten to 80 Nm + 240°.

4. Remove the special tool.

5. Install the front subframe front retaining bolt.

- Tighten to 150 Nm + 240°.

6. Remove the special tool.

7. NOTE: Left-hand shown, right-hand similar.

Install the engine mount retaining nut.

- Tighten to 63 Nm.

8.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Install the rear lower arm.

9.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Install the front lower arm.

10. Install the steering gear.

- Tighten to 100 Nm.

VUJ0005142

11. NOTE: Left-hand shown, right-hand similar.

Install the stabilizer bar link.

12. Attach the stabilizer bar link and install the stabilizer bar link retaining nut.

- Tighten to 43 Nm.

VUJ0005262

13. Attach the power steering hose retaining clip to the front subframe.

E52478

14. Attach the engine coolant inlet pipe to the front subframe.

15. Install the right-hand splash shield.

16. Attach the transmission fluid cooler.

- Tighten to 10 Nm.

17. Install the radiator splash shield.

For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

18. Install the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

19. Install both the front wheels and tires.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

20. Lower the vehicle.

21.  **CAUTION:** The final tightening of the suspension components must be carried out with the vehicle on its wheels.

- **NOTE:** Left-hand shown, right-hand similar.

Tighten the rear lower arm retaining nut and bolt.

- Tighten to 175 Nm.

22.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Tighten the front lower arm retaining nut and bolt.

- Tighten to 175 Nm.

23. NOTE: Left-hand shown, right-hand similar.

Tighten to 70 Nm.

24. Remove the special tool.

25. Remove the special tool.

26. Install the intake air shutoff throttle.

For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

27. Remove the radiator support.

28. Connect the battery ground cable.

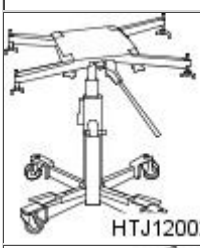

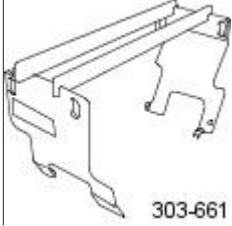

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

29. Using only four-wheel alignment equipment approved by Jaguar, check and adjust the wheel alignment.

For additional information, refer to: [Camber and Caster Adjustment](#) (204-00 Suspension System - General Information, General Procedures).

Uni-Body, Subframe and Mounting System - Front SubframeV6 3.0L Petrol

Removal and Installation

Special Tool(s)	
 <p>HTJ1200-2</p>	Power train assembly jack HTJ1200-2
 <p>303-661</p>	Engine Lifting Bracket 303-661
 <p>303-021</p>	Engine support bracket 303-021
 <p>502-005</p>	Subframe Alignment Bolt 502-005

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Using suitable tie straps, secure the radiator.

3. **NOTE:** Left-hand shown, right-hand similar.

Loosen the exhaust manifold retaining nut.

4. Install the special tool to the exhaust manifold.

- Install the retaining bolt.

5. NOTE: Left-hand shown, right-hand similar.

Install the retaining bolt.

6. Install the special tool support bars to the special tool.

7. Install the special tool.

8. Raise and support the vehicle.

9. Remove both the front wheels and tires.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

10. Remove the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

11. Remove the radiator splash shield.

For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

12. Remove the right-hand splash shield.

13. Detach the power steering hose retaining clip from the front subframe.

14. NOTE: Left-hand shown, right-hand similar.

Remove the stabilizer bar link upper retaining nut.

15. NOTE: Left-hand shown, right-hand similar.

Remove the stabilizer bar link lower retaining bolt and nut and remove the stabilizer bar link.

16. Detach the steering gear.

- Secure the steering gear.

17. NOTE: Left-hand shown, right-hand similar.

Release the front lower arm and position it to one side.

- Mark the position of the bolt.

VUJ0005102

18. NOTE: Left-hand shown, right-hand similar.

Release the rear lower arm and position it to one side.

VUJ0005104

19. NOTE: Left-hand shown, right-hand similar.

Remove the engine mount retaining nut.

VUJ0005532

20. Install the special tool to the front subframe.

E31131

21. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe front retaining bolt.

E31132

22. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe rear retaining bolt.

E31275

23. Remove the front subframe.

E31131

Installation

1. Install the front subframe.

E31131

2. NOTE: Left-hand shown, right-hand similar.

Install the special tool.

E38386

3. NOTE: Left-hand shown, right-hand similar.

Install the front subframe rear retaining bolt.

- Tighten to 80 Nm + 240°.

4. Remove the special tool.

5. Install the front subframe front retaining bolt.

- Tighten to 150 Nm + 240°.

6. Remove the special tool.

7. NOTE: Left-hand shown, right-hand similar.

Install the engine mount retaining nut.

- Tighten to 63 Nm.

VUJ0005104

8.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Install the rear lower arm.

VUJ0005102

9.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Install the front lower arm.

VUJ0005142

10. Install the steering gear.

- Tighten to 100 Nm.

VUJ0005262

11. NOTE: Left-hand shown, right-hand similar.

Install the stabilizer bar link.

VUJ0005261

12. Attach the stabilizer bar link and install the stabilizer bar link retaining nut.

- Tighten to 43 Nm.

13. Attach the power steering hose retaining clip to the front subframe.

14. Install the right-hand splash shield.

15. Install the radiator splash shield.

For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

16. Install the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

17. Install both the front wheels and tires.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

18. Lower the vehicle.

19.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Tighten the rear lower arm retaining nut and bolt.

- Tighten to 175 Nm.

20.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Tighten the front lower arm retaining nut and bolt.

- Tighten to 175 Nm.

21. NOTE: Left-hand shown, right-hand similar.

Tighten to 70 Nm.

22. Remove the special tool.

23. Remove the special tool support bars from the special tool.

24. NOTE: Left-hand shown, right-hand similar.

Remove the retaining bolt.

25. NOTE: Left-hand shown, right-hand similar.

Remove the special tool from the exhaust manifold.

- Remove the retaining bolt.

26. NOTE: Left-hand shown, right-hand similar.

Tighten the exhaust manifold retaining nut.

- Tighten to 20 Nm.

27. Remove the radiator support.

28. Connect the battery ground cable.

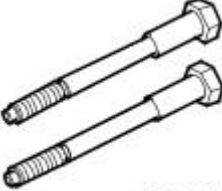

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

29. Using only four-wheel alignment equipment approved by Jaguar, check and adjust the wheel alignment.

For additional information, refer to: [Four-Wheel Alignment](#) (204-00 Suspension System - General Information, General Procedures).

Uni-Body, Subframe and Mounting System - Front Subframe 4.2L NA V8 - AJV8

Removal and Installation

Special Tool(s)	
 303-021	Engine support bracket 303-021
 HTJ12002	Power train assembly jack HTJ1200-2
 502-005	Subframe Alignment Bolt 502-005

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Using suitable tie straps, secure the radiator.

3. Remove the throttle body.
For additional information, refer to: [Throttle Body](#) (303-04A Fuel Charging and Controls - 4.2L NA V8 - AJV8, Removal and Installation).

4. Install the special tools.

5. Install the special tool.

6. Raise and support the vehicle.
7. Remove both the front wheels and tires.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
8. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).
9. Remove the radiator splash shield.
For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
10. Remove the right-hand splash shield.

11. Detach the power steering hose retaining clip from the front subframe.

12. NOTE: Left-hand shown, right-hand similar.

Remove the stabilizer bar link upper retaining nut.

13. NOTE: Left-hand shown, right-hand similar.

Remove the stabilizer bar link lower retaining bolt and nut and remove the stabilizer bar link.

14. Detach the steering gear.

- Secure the steering gear.

15. NOTE: Left-hand shown, right-hand similar.

Release the front lower arm and position it to one side.

- Mark the position of the bolt.

16. NOTE: Left-hand shown, right-hand similar.

Release the rear lower arm and position it to one side.

17. NOTE: Left-hand shown, right-hand similar.

Remove the engine mount retaining nut.

18. Install the special tool to the front subframe.

19. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe front retaining bolt.

20. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe rear retaining bolt.

21. Remove the front subframe.

Installation

1. Install the front subframe.

2. NOTE: Left-hand shown, right-hand similar.

Install the special tool.

3. NOTE: Left-hand shown, right-hand similar.

Install the front subframe rear retaining bolt.

- Tighten to 80 Nm + 240°.

4. Remove the special tool.

5. Install the front subframe front retaining bolt.

- Tighten to 150 Nm + 240°.

6. Remove the special tool.

7. **NOTE:** Left-hand shown, right-hand similar.

Install the engine mount retaining nut.

- Tighten to 63 Nm.

8. **⚠ CAUTION:** The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• **NOTE:** Left-hand shown, right-hand similar.

Install the rear lower arm.

9. **⚠ CAUTION:** The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• **NOTE:** Left-hand shown, right-hand similar.

Install the front lower arm.

VUJ0005142

10. Install the steering gear.

- Tighten to 100 Nm.

VUJ0005262

11. NOTE: Left-hand shown, right-hand similar.

Install the stabilizer bar link.

VUJ0005261

12. Attach the stabilizer bar link and install the stabilizer bar link retaining nut.

- Tighten to 43 Nm.

E52478

13. Attach the power steering hose retaining clip to the front subframe.

14. Install the right-hand splash shield.

E52476

15. Install the radiator splash shield.

For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

16. Install the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

17. Install both the front wheels and tires.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

18. Lower the vehicle.

19. NOTE: Left-hand shown, right-hand similar.

Tighten to 70 Nm.

VUJ0005262

20.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Tighten the front lower arm retaining nut and bolt.

- Tighten to 175 Nm.

VUJ0005102

21.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Tighten the rear lower arm retaining nut and bolt.

- Tighten to 175 Nm.

VUJ0005104

22. Remove the special tool.

E31240

23. Remove the special tool.

E30778

24. Install the throttle body.

For additional information, refer to: [Throttle Body](#) (303-04A Fuel Charging and Controls - 4.2L NA V8 - AJV8, Removal and Installation).

25. Remove the radiator support.

E31129

26. Connect the battery ground cable.

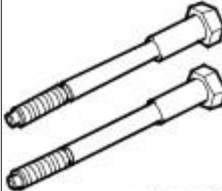

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

27. Using only four-wheel alignment equipment approved by

Jaguar, check and adjust the wheel alignment.
For additional information, refer to: [Camber and Caster Adjustment](#) (204-00 Suspension System - General Information, General Procedures).

Uni-Body, Subframe and Mounting System - Front Subframe 4.2L SC V8 -**AJV8**

Removal and Installation

Special Tool(s)	
 303-749	Engine lifting brackets 303-749
 303-021	Engine support bracket 303-021
 HTJ1200-2	Power train assembly jack HTJ1200-2
 502-005	Subframe Alignment Bolt 502-005

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Using suitable tie straps, secure the radiator.

3. Remove the air filter outlet tube.
For additional information, refer to: [Air Cleaner Outlet Pipe](#) (303-12B Intake Air Distribution and Filtering - 4.2L SC V8 - AJV8, Removal and Installation).

4. Install the special tools.

5. Install the special tool.

6. Raise and support the vehicle.
7. Remove both the front wheels and tires.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
8. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).
9. Remove the radiator splash shield.
For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

10. Remove the right-hand splash shield.

E52476

11. Detach the power steering hose retaining clip from the front subframe.

E52478

12. NOTE: Left-hand shown, right-hand similar.

Remove the stabilizer bar link upper retaining nut.

VUJ0005261

13. NOTE: Left-hand shown, right-hand similar.

Remove the stabilizer bar link lower retaining bolt and nut and remove the stabilizer bar link.

VUJ0005262

VUJ0005142

14. Detach the steering gear.

- Secure the steering gear.

VUJ0005102

15. NOTE: Left-hand shown, right-hand similar.

Release the front lower arm and position it to one side.

- Mark the position of the bolt.

VUJ0005104

16. NOTE: Left-hand shown, right-hand similar.

Release the rear lower arm and position it to one side.

VUJ0005532

17. NOTE: Left-hand shown, right-hand similar.

Remove the engine mount retaining nut.

18. Install the special tool to the front subframe.

19. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe front retaining bolt.

20. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe rear retaining bolt.

21. Remove the front subframe.

Installation

1. Install the front subframe.

2. NOTE: Left-hand shown, right-hand similar.

Install the special tool.

3. NOTE: Left-hand shown, right-hand similar.

Install the front subframe rear retaining bolt.

- Tighten to 80 Nm + 240°.

4. Remove the special tool.

5. Install the front subframe front retaining bolt.

- Tighten to 150 Nm + 240°.

6. Remove the special tool.

7. NOTE: Left-hand shown, right-hand similar.

Install the engine mount retaining nut.

- Tighten to 63 Nm.

8.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Install the rear lower arm.

9.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Install the front lower arm.

10. Install the steering gear.

- Tighten to 100 Nm.

VUJ0005142

11. NOTE: Left-hand shown, right-hand similar.

Install the stabilizer bar link.

VUJ0005262

12. Attach the stabilizer bar link and install the stabilizer bar link retaining nut.

- Tighten to 43 Nm.

VUJ0005261

13. Attach the power steering hose retaining clip to the front subframe.

14. Install the right-hand splash shield.

15. Install the radiator splash shield.
For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
16. Install the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).
17. Install both the front wheels and tires.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
18. Lower the vehicle.

19.  **CAUTION:** The final tightening of the suspension components must be carried out with the vehicle on its wheels.

- **NOTE:** Left-hand shown, right-hand similar.

Tighten the front lower arm retaining nut and bolt.

- Tighten to 175 Nm.

21. **NOTE:** Left-hand shown, right-hand similar.
20.  **CAUTION:** The final tightening of the suspension components must be carried out with the vehicle on its wheels.

- **NOTE:** Left-hand shown, right-hand similar.

Tighten the rear lower arm retaining nut and bolt.

- Tighten to 175 Nm.

22. Remove the special tool.

23. Remove the special tool.

24. Install the air filter outlet tube.

For additional information, refer to: [Air Cleaner Outlet Pipe](#) (303-12B Intake Air Distribution and Filtering - 4.2L SC V8 - AJV8, Removal and Installation).

25. Remove the radiator support.

26. Connect the battery ground cable.

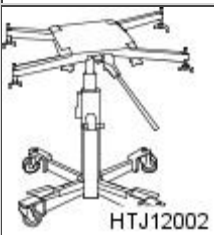

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

27. Using only four-wheel alignment equipment approved by

Jaguar, check and adjust the wheel alignment.
For additional information, refer to: [Camber and Caster Adjustment](#) (204-00 Suspension System - General Information, General Procedures).

Uni-Body, Subframe and Mounting System - Rear Subframe

Removal and Installation

Special Tool(s)	
 HTJ12002	Powertrain assembly jack
	HTJ1200-2

Removal

1. Drain the fuel tank.
For additional information, refer to: [Fuel Tank Draining](#) (310-00 Fuel System - General Information, General Procedures).
2. Remove the exhaust system.
For additional information, refer to: Exhaust System (309-00A, Removal and Installation) / Exhaust System (309-00B, Removal and Installation) / [Exhaust System](#) (309-00 Exhaust System - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
3. Remove the axle assembly.
For additional information, refer to: [Axle Assembly - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Vehicles Without: Differential Drain Plug](#) (205-02 Rear Drive Axle/Differential, Removal and Installation).
4. Remove both the upper arms.
For additional information, refer to: [Upper Arm](#) (204-02 Rear Suspension, Removal and Installation).
5. Disconnect the electric parking brake electrical connector.

6. Detach the wiring harness.

7. Detach the fuel filler hose.

E31120

8. NOTE: Right-hand shown, left-hand similar.

Detach the shock absorber.

E31128

9. NOTE: Left-hand shown, right-hand similar.

Remove the rear subframe reinforcement plate retaining bolts.

E31121

10. Install the special tool to support the rear subframe.

E31122

11. NOTE: Left-hand shown, right-hand similar.

Remove the rear subframe rear retaining bolt.

E31123

12. NOTE: Left-hand shown, right-hand similar.

Remove the rear subframe front retaining bolt.

E31124

13. Remove the rear subframe.

E31122

Installation

1. Install the rear subframe.

E31122

2. NOTE: Left-hand shown, right-hand similar.

Loosely install the rear subframe front bolt.

E31124

3. Loosely install the rear subframe reinforcement plate bolts.

E31121

4. Tighten to retaining bolt.

- Tighten to 80 Nm.
- Tighten a further 240 degrees.

E31124

5. NOTE: Left-hand shown, right-hand similar.

Install the rear subframe rear retaining bolt.

- Tighten to 125 Nm.

E31123

6. Remove the special tool.

7. NOTE: Left-hand shown, right-hand similar.

Install the rear subframe reinforcement plate retaining bolts.

- Tighten to 47 Nm.

8. NOTE: Right-hand shown, left-hand similar.

Install the shock absorber.

1. Tighten to 133 Nm.

9. Connect the fuel filler hose.

10. Attach the wiring harness.

E31119

11. Connect the electric parking brake electrical connector.

E31118

12. Install both upper arms.

For additional information, refer to: [Upper Arm](#) (204-02 Rear Suspension, Removal and Installation).

13. Install the axle assembly.

For additional information, refer to: [Axle Assembly - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8. Vehicles Without: Differential Drain Plug](#) (205-02 Rear Drive Axle/Differential, Removal and Installation).

14. Install the exhaust system.

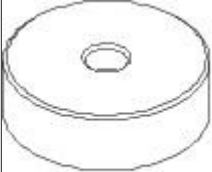

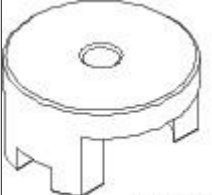

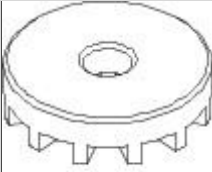

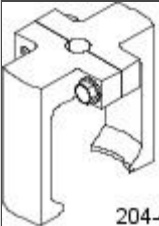

For additional information, refer to: Exhaust System (309-00A, Removal and Installation) / Exhaust System (309-00B, Removal and Installation) / [Exhaust System](#) (309-00 Exhaust System - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

15. Refill the fuel tank.

16. Using only four-wheel alignment equipment approved by Jaguar, check the wheel alignment, and adjust if required.

Uni-Body, Subframe and Mounting System - Rear Subframe Rear Bushing

Removal and Installation

Special Tool(s)	
 <p>204-469</p>	Forcing bolt 204-469
 <p>204-475</p>	Receiver-bush 204-475
 <p>204-474</p>	Replacer-bush 204-474
 <p>204-473</p>	Remover bush 204-473
 <p>204-472</p>	Remover support-bush 204-472

Removal

1. For additional information, refer to: [Rear Subframe](#) (502-00 Uni-Body, Subframe and Mounting System, Removal and Installation).
2. **NOTE:** Note the orientation of the bushing before removal.

Installation

1. NOTE: Make sure the bushing is correctly orientated.

2. For additional information, refer to: [Rear Subframe](#) (502-00 Uni-Body, Subframe and Mounting System, Removal and Installation).
