

Workshop Manual

X250 - XF

2008 to 2009MY

VIN R00019 to VIN R47514

TABLE OF CONTENTS

1: General Information

100: Service Information

100-00: General Information

Description and Operation

About This Manual

Application and Use of Specifications

Battery and Battery Charging Health and Safety Precautions

Brake System Health and Safety Precautions

General Service Information

Health and Safety Precautions

How To Use This Manual

Important Safety Instructions

Petrol and Petrol-Ethanol Fuel Systems Health and Safety Precautions

Solvents, Sealants and Adhesives

Standard Workshop Practices

Symbols Glossary

Supplemental Restraint System (SRS) Health and Safety Precautions

Road/Roller Testing

100-01: Identification Codes

Description and Operation

Identification Codes

100-02: Jacking and Lifting

Description and Operation

Jacking

Lifting

100-04: Noise, Vibration and Harshness

Description and Operation

Noise, Vibration and Harshness (NVH)

Diagnosis and Testing

Noise, Vibration and Harshness (NVH)

General Procedures

Exhaust System Neutralizing

2: Chassis

204: Suspension

204-00: Suspension System - General Information

Specification

Diagnosis and Testing

Suspension System

General Procedures

Camber and Caster Adjustment

Four-Wheel Alignment

Front Toe Adjustment (57.65.01)

Rear Toe Adjustment (57.65.08)

204-01: Front Suspension

Diagnosis and Testing

Front Suspension

Removal and Installation

Front Shock Absorber (60.30.04)

Front Lower Arm (60.35.53)

Rear Lower Arm (60.35.54)

Rear Lower Arm Bushing (60.35.56)

Shock Absorber Bushing (60.30.16) (60.30.23)

Front Stabilizer Bar (60.10.01) - TDV6 2.7L Diesel

Front Stabilizer Bar (60.10.01) - V6 3.0L Petrol

Front Stabilizer Bar (60.10.01) - V8 4.2L Petrol/V8 S/C 4.2L Petrol

Front Stabilizer Bar Link (60.10.02)

- Stabilizer Bar Link Bushing (60.10.03)
- Upper Arm LH (60.35.41)
- Upper Arm RH (60.35.42)
- Front Wheel Bearing and Wheel Hub (60.25.03)
- Wheel Knuckle (60.25.23)

204-02: Rear Suspension

- Specification

- Description and Operation

 - Component Location

 - Overview

 - System Operation and Component Description

- Diagnosis and Testing

 - Rear Suspension

- Removal and Installation

 - Upper Arm (64.25.31)

 - Lower Arm (64.35.43)

 - Shock Absorber and Spring Assembly

 - Shock Absorber Lower Bushing (64.30.39)

 - Rear Stabilizer Bar (64.35.08)

 - Rear Wheel Bearing

- Disassembly and Assembly

 - Shock Absorber and Spring Assembly

204-04: Wheels and Tires

- Specification

- Description and Operation

 - Component Location

 - Overview

 - System Operation and Component Description

- Diagnosis and Testing

 - Wheels and Tires

- Removal and Installation

 - Tire Low Pressure Sensor

 - Tire Pressure Monitoring System (TPMS) Front Antenna

 - Tire Pressure Monitoring System (TPMS) Rear Antenna

 - Tire Pressure Monitoring System (TPMS) Module

Tire Pressure Monitoring System (TPMS) Receiver
Wheel and Tire

204-05: Vehicle Dynamic Suspension

Description and Operation

Component Location - V8 4.2L Petrol/V8 S/C 4.2L Petrol

Overview - V8 4.2L Petrol/V8 S/C 4.2L Petrol

System Operation and Component Description - V8 4.2L Petrol/V8 S/C 4.2L Petrol

Diagnosis and Testing

Vehicle Dynamic Suspension

Removal and Installation

Adaptive Damping Module

Front Suspension Vertical Accelerometer

Rear Suspension Vertical Accelerometer

204-06: Ride and Handling Optimization

Description and Operation

Component Location

Overview

System Operation and Component Description

205: Driveline

205-00: Driveline System - General Information

Diagnosis and Testing

Driveline System

General Procedures

Driveline Angle Inspection

205-01: Driveshaft

Specification

Description and Operation

Component Location

Overview

System Operation and Component Description

Diagnosis and Testing

Driveshaft

General Procedures

Driveshaft Runout and Balancing

Removal and Installation

Driveshaft

205-02: Rear Drive Axle/Differential

Specification - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8

Description and Operation

Component Location - V8 4.2L Petrol/V8 S/C 4.2L Petrol

Overview - V8 4.2L Petrol/V8 S/C 4.2L Petrol

System Operation and Component Description - V8 4.2L Petrol/V8 S/C 4.2L Petrol

Diagnosis and Testing

Rear Drive Axle and Differential

Removal and Installation

Axle Assembly (51.25.13) - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Vehicles Without: Differential Drain Plug

Axle Housing Bushing (64.25.30) - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8

205-05: Rear Drive Halfshafts

Specification

Description and Operation

Component Location

Overview

System Operation and Component Description

Diagnosis and Testing

Rear Drive Halfshafts

Removal and Installation

Rear Halfshaft (47.10.13)

Inner Constant Velocity (CV) Joint Boot (47.10.33)

Outer Constant Velocity (CV) Joint Boot (47.10.32)

206: Brake System

206-00: Brake System - General Information

Specification

Diagnosis and Testing

Brake System

General Procedures

Brake Disc Runout Check

Brake System Bleeding (70.25.03)

206-03: Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8
- AJV8

Specification

General Information - About This Manual

Description and Operation

Introduction

This manual covers diagnosis and testing and repair procedures.

It is structured into groups and sections, with specific system sections collected together under their relevant group.

A group covers a specific portion of the vehicle. The manual is divided into five groups, General Information, Chassis, Powertrain, Electrical and Body and Paint. The number of the group is the first number of a section number.

Within Etis, the navigation tree will list the groups. After selecting a group the navigation tree will then list the sections within that group. Each section has a contents list detailing Specifications, Description and Operation, Diagnosis and Testing, General Procedures, Disassembly and Assembly, Removal and Installation.

References to LH (left-hand) and RH (right-hand)

All [LH](#) and [RH](#) references to the vehicle are taken from a position sitting in the driver seat looking forward.

Vehicle [LH](#) and [RH](#) definition

E126780

Item	Part Number	Description
1	-	LH
2	-	RH

All [LH](#) and [RH](#) references to the engine are taken from a position at the flywheel looking towards the crankshaft front pulley.

Powertrain [LH](#) and [RH](#) definition

E126781

Item	Part Number	Description
1	-	front
2	-	right
3	-	rear
4	-	left

How to use Repair Procedures

This manual has been written in a format that is designed to meet the needs of technicians worldwide. It provides general descriptions for accomplishing repair work with tested and effective techniques.

Important Safety Instructions

Appropriate service methods and correct repair procedures are essential for the safe, reliable operation of all motor vehicles as well as the personal safety of the individual carrying out the work.

Anyone who departs from the instructions provided in this manual must first establish that personal safety or vehicle integrity is not compromised by the choice of method, tools or components.

Warnings, Cautions and Notes in This Manual

WARNING: Warnings are used to indicate that failure to follow a procedure correctly may result in personal injury.

CAUTION: Cautions are used to indicate that failure to follow a procedure correctly may result in damage to the vehicle or equipment being used.

- **NOTE:** Notes are used to provide additional essential information required to carry out a complete and satisfactory repair.

Generic warnings or cautions are in their relevant description and operation procedure within section 100-00. If the generic warnings or cautions are required for a procedure, there will be a referral to the appropriate description and operation procedure.

If a warning, caution or note only applies to one step, it is placed at the beginning of the specific step.

Trustmark Authoring Standards (TAS) Repair Procedures

- **NOTE:** TAS style procedures can be identified by steps that have no accompanying step text and the magenta color of the electrical connectors and fasteners such as nuts, bolts, clamps or clips.

A TAS removal and installation procedure uses a sequence of color illustrations to indicate the order to be followed when removing/disassembling or installing/assembling a component.

Many of the TAS procedures will have the installation information within the removal steps. These procedures will have the following note at the beginning of the procedure:

• NOTE: Removal steps in this procedure may contain installation details.

Reuse of fasteners and seals and gaskets

The following list details the general policy for the reuse of fasteners and seals and gaskets.

Types of self-locking nuts and bolts

• NOTE: There are more types of self-locking fasteners available than shown in following illustration.

E126782

Item	Part Number	Description
1	-	Completely coated self-locking bolt
2	-	Partially coated self-locking bolt
3	-	Self-locking bolt with a locking washer
4	-	Self-locking nut with a plastic locking insert
5	-	Self-locking nut with thread deformation (3 dents)
6	-	Self-locking nut with thread deformation (squeeze of thread to oval shape)
7	-	Self-locking nut with integrated locking ring

- All types of seals and gaskets must be discarded and new seals and gaskets installed unless otherwise stated within the procedure.
- Nuts and bolts with a chemical coating for locking and/or sealing and/or antiseize must be discarded unless the procedure advises to reapply the coating with a specified material.
- Nuts and bolts with a mechanical locking such as thread inserts, thread deformation or locking washers must be discarded and new nuts and bolts installed unless otherwise stated within the procedure.
- Torque to yield bolts must be discarded and new torque to yield bolts installed unless otherwise stated within the procedure, recognizable by a tightening torque with more than one stage together with a torque angle.

Specification data

Specification procedures will only contain technical data that is not already part of a repair procedure.

Sequence of tasks

If components must be removed or installed in a specific sequence, the sequence will be identified numerically in a graphic and the corresponding text will be numbered accordingly.

Special Tools, Equipment, Materials and Torque Figures

Special tools will be shown with the tool numbers in the illustration. The special tool numbers, general equipment, materials and torque figures used for the procedure step will be shown in the text column.

TAS Graphics

Colors used in the graphic are as follows:

- Blue - Component to be removed/installed or disassembled/assembled.
- Green and Brown - Additional components that need to be removed/installed or disassembled/assembled prior to

- the target component.
- Yellow - Component that is touched or affected in a way but remains in the vehicle. It may be detached, attached, moved, modified, checked, adjusted etc.
- Magenta - Electrical connectors and fasteners such as nuts, bolts, clamps and clips.
- Pale Blue - Special tool(s) and general equipment.

One illustration may have multiple steps assigned to it.

Numbered pointers are used to indicate the number of electrical connectors and fasteners such as nuts, bolts, clamps and clips.

Items in the illustration can be transparent or use cutouts to show hidden details.

E92595

TAS Symbols

Symbols are used inside the graphics and in the text area to enhance the information display. The following paragraphs describe the various types and categories of symbols.

For additional information, refer to: [Symbols Glossary](#) (100-00 General Information, Description and Operation).

Prohibition symbols advise on prohibited actions to either avoid damage or health and safety related risks. These symbols are

E85026

Health and Safety symbols recommend the use of particular protection equipment to avoid or at least reduce the risk or severity of possible injuries.

2.  

E85027

Warning symbols are used to indicate potential risks resulting from a certain component or area.

3. 

E85028

Instruction symbols are used to apply sealer, lubricant, weight, tape or cleaning detergent to a component.

E84834

Location symbols are used to show the location of a component or system within the vehicle.

E84835

Gearshift lever or selector lever position symbols are used to show which gearshift lever or selector lever position is to be set.

E84836

Pointer symbols are used to draw attention to components and give special instructions such as a required sequence or number of components. The number of components is reflected by the value inside the luty arrow. A sequence number is located inside the circle. Numbers inside circles are also used to allocate special information such as tightening torques or chemicals to a particular component.

E84837

Movement arrows are used to show three dimensional or rotational movements. These movements can include specific values inside the symbol if required.

E84838

Standard tool symbols recommend the use of certain standard tools. These tools can include dimension values if required.

E84839

The following graphic illustrates a set of symbols that are used to provide detailed information on where to apply a material.

E84840

Measurement symbols provide detailed information on where to carry out a specific measurement. These symbols can include specific values if required.

E84841

How to use Diagnosis and Testing procedures

Inspection and Verification

Visual Inspection Charts, Symptom Charts and other information charts (such as diagnostic routines) or supplement test procedures with technical specifications will navigate the user to a specific test procedure.

Symptom Chart

The symptom chart indicates symptoms, sources and actions to address a condition.

Pinpoint Tests

For electrical systems, pinpoint test steps are used to identify the source of a concern in a logical, step-by-step manner. Pinpoint tests have two columns: CONDITIONS and DETAILS/RESULTS/ACTIONS.

The CONDITIONS column is used exclusively for graphics and icons (with or without captions) and the DETAILS/RESULTS /ACTIONS column provides direction to another test step or specific corrective actions.

The boxed numbers indicate the order in which the described action is to be carried out.

Component Tests

A component test is used when a component is tested in multiple pinpoint tests, or if a procedure is too complicated to be formatted within a single page of the pinpoint test.

Graphics

Test graphics show the measurement or test to be carried out in a test step.

A representative tester graphic is used for voltmeters and ohmmeters.

If multiple measurements are made in a single graphic, the test leads are drawn with a solid line until the test lead splits to indicate the multiple measurements, at which point dashed lines are used.

Breakout box type testers are represented by a double circle test pin. Test pins are labeled with the pin number.

General Information - Application and Use of Specifications

Description and Operation

Torque Specifications

Torque specifications are shown in the torque specifications chart located at the front of the relevant section.

General Information - Battery and Battery Charging Health and Safety

Precautions

Description and Operation

- WARNINGS:

Batteries contain sulphuric acid, avoid contact with skin, eyes or clothing. Wear safety goggles when working near the battery to protect against possible splashing of the acid solution.

EYE CONTACT: If acid comes into contact with the eyes, flush immediately with plenty of running water for a minimum of 15 minutes. Seek immediate medical attention.

SKIN CONTACT: If acid comes into contact with the skin, flush immediately with plenty of running water for a minimum of 15 minutes. Seek immediate medical attention.

SWALLOWED: If acid is swallowed, rinse the mouth with plenty of water and then drink plenty of water or milk. Do not induce vomiting. Seek immediate medical attention.

Batteries normally produce explosive gases. Do not allow naked flames, sparks or lighted substances to come near the battery.

When charging the battery shield your face and wear safety goggles. Provide adequate ventilation.

CAUTION: Boost charging with excessive current or voltage above 16 volts will damage the battery.

General Information - Brake System Health and Safety Precautions

Description and Operation

- WARNINGS:

EYE CONTACT: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with the eyes. Wash hands thoroughly after handling. If brake fluid comes into contact with the eyes, flush the eyes with plenty of cold running water for 15 minutes. Seek medical attention for any persistent eye irritation or abnormality.

SWALLOWED: Brake fluid contains polyglycol ethers and polyglycols. If swallowed, drink plenty of water. Seek immediate medical attention.

INHALED: Dust from friction materials can be harmful if inhaled.

Only use new specified brake fluid from airtight containers.

CAUTION: If brake fluid is spilled on the paintwork, the affected area must be immediately washed down with cold water.

General Information - General Service Information

Description and Operation

Repairs and Replacements

When service parts are required, it is essential that only genuine Jaguar/Daimler replacements are used.

Attention is drawn to the following points concerning repairs and the installation of replacement parts and accessories:

- Safety features embodied in the vehicle may be impaired if other than genuine parts are installed. In certain territories, legislation prohibits the installation of parts which are not produced to the vehicle manufacturer's specification.
- Torque wrench setting figures given in this manual must be strictly adhered to. Locking devices, where specified, must be installed. If the efficiency of a locking device is impaired during removal it must be renewed.
- Owners purchasing accessories while travelling abroad should make sure that the accessory and its installed location on the vehicle conform to mandatory requirements existing in their country of origin.
- The vehicle warranty may be invalidated by the installation of other than genuine Jaguar/Daimler parts. All Jaguar/Daimler replacements have the full backing of the factory warranty.
- Jaguar/Daimler dealers are obliged to supply only genuine service parts.

Vehicle Specifications

Purchasers are advised that the specification details set out in this manual apply to a range of vehicles and not to any specific one. For the specification of a particular vehicle, purchasers should consult their dealer.

The Manufacturer reserves the right to vary the specifications, with or without notice, and at such times and in such manner as the Manufacturer thinks fit. Major as well as minor changes may be involved, in accordance with the Manufacturer's policy of continuous improvement.

Whilst every effort is made to make sure the accuracy of the particulars contained in this manual, neither the Manufacturer nor the Dealer, by whom the manual is supplied, shall in any circumstances be held liable for any inaccuracy or the consequences thereof.

Service Repair Operation Numbering

A master index of numbered operations has been compiled for universal application to all vehicles manufactured by Jaguar Cars Ltd.

Each operation is allocated a number from the master index and cross-refers with an identical number in the Repair Operation Times schedule. The number consists of six digits arranged in three pairs.

Each maintenance procedure in this manual is described in the sequence necessary to complete the operation in the minimum time, as specified in the Repair Operation Times schedule.

References to Bank-1 and Bank-2

References to Bank-1 and Bank-2 are made with regard to the engine. When viewed from the flywheel the right-hand bank will be Bank-1 and the left-hand bank will be Bank-2.

Special Tools

Any special tools and equipment required to perform a maintenance procedure, are shown at the beginning of each procedure. When possible, illustrations are given to assist in identifying the tool needed.

Disconnecting/Connecting the Battery

Always stop the engine before disconnecting the battery negative lead and make sure the battery positive lead is isolated i.e. wrapped in a suitable cloth.

WARNING: Radio code saving devices must not be used when conducting work on Air Bag or Fuel systems. It must be noted that, when using these devices, the vehicle electrical system is still live albeit with a reduced current flow.

• **NOTE:** Before disconnecting the battery make sure that the radio receiver/cassette player/mini disc player and compact disc player keycodes are known and, that no data is required from the Engine Control Module (ECM) as battery disconnection will erase any fault codes and idle/drive values held in the Keep Alive Memory (KAM).

Always disconnect the battery before commencing repair operations which require:

- The vehicle to be jacked up
- Work on the engine
- Work underneath the vehicle
- Arc welding

Alternatively a Radio Code Saver may be used, when not working on the Air Bag or Fuel systems. With the battery disconnected, a Radio Code Saver will allow sufficient current to pass to maintain the radio receiver/cassette player/mini disc player and compact disc player memory, operate the clock and supply the door operated interior lights while isolating the battery in the event of a short circuit.

Reconnecting the Battery

WARNING: If the battery has been on bench charge the cells may be giving off explosive hydrogen gas. Avoid creating sparks, and if in doubt cover the vent plugs or covers with a damp cloth.

Always make sure that all electrical systems are switched OFF before reconnecting the battery to avoid causing sparks or damage to sensitive electrical equipment.

Always reconnect the battery positive lead first and the negative last, ensuring that there is a good electrical contact and the battery terminals are secure.

Restart the clock (where installed) and set it to the correct time.

Enter the radio receiver/cassette player/mini disc player and compact disc player keycodes and preset frequencies, if known.

Following reconnection of the battery, the engine should be allowed to idle until it has reached normal operating temperature as the stored idle and drive values contained within the ECM have been lost. Allow the vehicle to idle for a further three minutes. Drive the vehicle at constant speeds of approximately 48 km/h (30 mph), 64 km/h (40 mph), 80 km/h (50 mph), 96 km/h (60 mph) and 112 km/h (70 mph) for three minutes each. This will allow the ECM to relearn idle and drive values, and may cause driveability concerns if the procedure is not carried out.

Connecting a Slave Battery Using Jump Leads

WARNING: If the slave battery has recently been charged and is gassing, cover the vent plugs or covers with a damp cloth to reduce the risk of explosion should arcing occur when connecting the jump leads.

• CAUTIONS:

A discharged battery condition may have been caused by an electrical short circuit. If this condition exists there will be an apparently live circuit on the vehicle even when all circuits are switched off. This can cause arcing when the jump leads are connected.

Whilst it is not recommended that the vehicle is jump started, it is recognized that this may occasionally be the only practical way to mobilize a vehicle. In such an instance the discharged battery must be recharged immediately after jump starting to avoid permanent damage.

- Always make sure that the jump leads are adequate for the task. Heavy duty cables must be used.
- Always make sure that the slave battery is of the same voltage as the vehicle battery. The batteries must be connected in parallel.
- Always make sure that switchable electric circuits are switched off before connecting jump leads. This reduces the risk of sparks occurring when the final connection is made.

WARNING: Make sure that the ends of the jump leads do not touch each other or ground against the vehicle body at any time while the leads are attached to the battery. A fully charged battery, if shorted through jump leads, can discharge at a rate well above 1000 amps causing violent arcing and very rapid heating of the jump leads and terminals, and can even cause the battery to explode.

Always connect the jump leads in the following sequence.

- Slave battery positive first then vehicle battery positive.
- Slave battery negative next and then vehicle ground at least, 300 mm (12 in) from the battery terminal e.g. engine lifting bracket.

Always reduce the engine speed to idle before disconnecting the jump leads.

Before removing the jump leads, switch on the heater blower (high) or the heated rear screen, to reduce the voltage peak when the leads are removed.

Always disconnect the jump leads in the reverse order to the connecting sequence and take great care not to short the ends of the leads.

Do not rely on the generator to restore a discharged battery. For a generator to recharge a battery, it would take in excess of 8 hours continuous driving with no additional loads placed on the battery.

Component Cleaning

To prevent ingress of dirt, accumulations of loose dirt and greasy deposits should be removed before disconnecting or dismantling components or assemblies.

Components should be thoroughly cleaned before inspection prior to reassembly.

Cleaning Methods:

- Dry Cleaning
- Removal of loose dirt with soft or wire brushes
- Scraping dirt off with a piece of metal or wood
- Wiping off with a rag

CAUTION: Compressed air is sometimes wet so use with caution, especially on hydraulic systems.

- Blowing dirt off with compressed air (Eye protection should be worn when using this method)
- Removal of dry dust using vacuum equipment. This method should always be used to remove friction lining material dust (asbestos particles)
- Steam Cleaning

Calibration of Essential Measuring Equipment

WARNING: Failure to comply may result in personal injury or damage to components.

It is of fundamental importance that certain essential equipment e.g. torque wrenches, multimeters, exhaust gas analysers, rolling roads etc., are regularly calibrated in accordance with the manufacturers instructions.

Use of Control Modules

Control modules may only be used on the vehicle to which they were originally installed. Do not attempt to use or test a control module on any other vehicle.

Functional Test

On completion of a maintenance procedure, a thorough test should be carried out, to ensure the relevant vehicle systems are working correctly.

Preparation

Before disassembly, clean the surrounding area as thoroughly as possible. When components have been removed, blank off any exposed openings using grease-proof paper and masking tape. Immediately seal fuel, oil and hydraulic lines when separated, using plastic caps or plugs, to prevent loss of fluid and the entry of dirt. Close the open ends of oil ways, exposed by component removal, with tapered hardwood plugs or readily visible plastic plugs. Immediately a component is removed, place it in a suitable container; use a separate container for each component and its associated parts. Before dismantling a component, clean it thoroughly with a recommended cleaning agent; check that the agent will not damage any of the materials within the component. Clean the bench and obtain marking materials, labels, containers and locking wire before dismantling a component.

Dismantling

Observe scrupulous cleanliness when dismantling components, particularly when parts of the brake, fuel or hydraulic systems are being worked on. A particle of dirt or a fragment of cloth could cause a dangerous malfunction if trapped in these systems. Clean all tapped holes, crevices, oil ways and fluid passages with compressed air.

WARNING: Do not permit compressed air to enter an open wound. Always use eye protection when using compressed air.

Make sure that any O-rings used for sealing are correctly reinstalled or renewed if disturbed. Mark mating parts to make sure that they are replaced as dismantled. Whenever possible use marking materials which avoid the possibilities of causing distortion or the initiation of cracks, which could occur if a center punch or scriber were used. Wire together mating parts where necessary to prevent accidental interchange (e.g. roller bearing components). Tie labels on to all parts to be renewed and to parts requiring further inspection before being passed for reassembly. Place labelled parts and other parts for rebuild in separate containers. Do not discard a part which is due for renewal until it has been compared with the new part, to make sure that the correct part has been obtained.

Inspection

Before inspecting a component for wear or performing a dimensional check, make sure that it is absolutely clean; a slight smear of grease can conceal an incipient failure. When a component is to be checked dimensionally against figures quoted for it, use the correct equipment (surface plates, micrometers, dial gauges etc.) in serviceable condition. The use of makeshift equipment can be dangerous. Reject a component if its dimensions are outside the limits quoted, or if damage is apparent. A component may be reinstalled if its critical dimension is exactly to the limit size and it is otherwise satisfactory. Use Plastigauge 12 Type PG-1 for checking bearing surface clearance, e.g. big end bearing shell to crank journal. Instructions for the use of Plastigauge and a scale giving bearing clearances in steps of 0,0025 mm (0.0001 in) are supplied with the package.

On-Board Diagnostics (OBD)

This vehicle uses programmed electronic control systems to provide engine management and emission regulation, automatic transmission operation and anti-lock braking control. These control systems are integral with the On-Board Diagnostics (OBD) facility that is used in conjunction with either the Jaguar approved diagnostic system or the more restricted scan tools.

The OBD information in this manual provides diagnostic and rectification procedures for emission related electrical and mechanical systems. The information is intended to facilitate fault diagnosis and the subsequent rectification of the vehicle without recourse to the Jaguar approved diagnostic system.

The diagnosis and testing sections within the manual cover:

- System principles of operation with links to the relevant Description and Operation sections
- Self tests (where appropriate)
- Inspection and Verification - manual checks, symptom and Diagnostic Trouble Code (DTC) driven diagnostic charts with actions required to rectify concerns
- Component tests (where appropriate)

Circuit Diagrams

To understand the relationship between the vehicle electrical system and the system circuit diagrams, Refer to the Electrical Guide.

In the interest of clarity, single lines may represent multiple wires. Refer to the color code (1st alpha) followed by the wire reference (numeric/alpha/numeric) to trace origin and destination.

e.g. BW 647B002. BW (black with white trace) 647 (wire reference) B002 (stage from origin).

Glossary of Terms

This glossary of terms is intended to cover mainly emissions-related (to SAE J 1930) terminology, and other abbreviations that may be used in this manual.

The required term may be looked-up in the left-hand column, and subsequent columns give the standard acronym, unit or abbreviation, and definition.

Term(s)	Acronym/Unit /Abbreviation	Definition
Air Conditioning	A/C	
Accelerator Pedal Position	APP	Is a multitrack sensor which inputs the drivers demand into the engine control module (ECM)
After Bottom Dead Center	ABDC	Event occurring after bottom dead center
After Top Dead Center	ATDC	Event occurring after top dead center
Anti-lock Brake System	ABS	System which prevents wheel lock-up under braking by sensing lack of rotation of a wheel(s) and diverting fluid pressure away from it (them)
Alternating Current	ac	
Amplitude Modulation	AM	
Automatic Temperature Control	ATC	
Automatic Transmission Fluid	ATF	
Ampere	A	SI unit of current
Ampere hour	Ah	
Barometric Pressure	BARO	Pressure of surrounding air at any given temperature and altitude
Battery positive voltage	B+	The positive voltage from a battery or any circuit connected directly to it
Before Bottom Dead Center	BBDC	Event occurring before bottom dead center
Before Top Dead Center	BTDC	Event occurring before top dead center
Bottom Dead Center	BDC	Lowest point of piston travel in a reciprocating engine
Battery Junction Box	BJB	
Brake Pedal Position	BPP	
Brake Horsepower	BHP	Effective horsepower developed by an engine or motor, as measured by a brake applied to its output shaft
British Standard	BS	Standard specification issued by the British Standards Institution
Brake Traction Control System	BTCS	
Bus	Topology of a communication network	
Coast Clutch Solenoid	CCS	
Camshaft Position	CMP	Indicates camshaft position
Carbon dioxide	CO ²	Colorless gas with a density of approximately 1.5 times that of air
Carbon monoxide	CO	Poisonous gas produced as the result of incomplete combustion
Chlorofluorocarbon	CFC	
Catalytic converter		In-line exhaust system device used to reduce the level of engine exhaust emissions
Celsius	C	SI term for the Centigrade scale, with freezing point at zero and boiling point at 100 degrees
Compact Disc	CD	
Cylinder Head Temperature Sensor	CHT Sensor	A sensor for measuring the temperature of the cylinder head
Central Junction Box	CJB	
Crankshaft Position	CKP	Indicates crankshaft position
Clutch Pedal Position	CPP	Indicates clutch pedal position

Term(s)	Acronym/Unit /Abbreviation	Definition
Controller Area Network	CAN	A communication system which allows control modules to be linked together
Constant Velocity	CV	
Cubic centimeter	cm ³	
Central Security Module	CSM	Electronic module to support security system functionality
Data Link Connector	DLC	Connector providing access and/or control of the vehicle information, operating conditions, and diagnostic information
Driver Door Module	DDM	Electronic module to support driver door functionality
Driver Seat Module	DSM	Electronic module to support driver seat functionality
Daytime Running Lamps	DRL	
Deutsche Institut fur Normung	DIN	German standards regulation body
Diagnostic Trouble Code	DTC	An alpha/numeric identifier for a fault condition identified by the On-Board Diagnostic (OBD) system
Direct current	dc	Current which flows in one direction only, though it may have appreciable pulsations in its magnitude
Domestic Data Bus	D2B	
Digital Versatile Disc	DVD	
Electronic Automatic Temperature Control	EATC	
Exhaust Gas Recirculation	EGR	
Exhaust Gas Recirculation Temperature Sensor	EGRT	Sensing EGR function based on temperature change
Electronic Brake Force Distribution	EBD	
Engine Control Module	ECM	Electronic module to support engine functionality
Electronic Crash Sensor	ECS	Sensor to measure severity of impact
Engine Coolant Temperature	ECT	
Engine Oil Pressure	EOP	
European On-Board Diagnostic	EOBD	
Electronic Pressure Control	EPC	
Electrically Erasable Programmable Read-Only Memory	EEPROM	
Erasable Programmable Read-Only Memory	EPROM	
Evaporative Emission	EVAP	System designed to prevent fuel vapor from escaping into the atmosphere. Typically includes a charcoal filled canister to absorb fuel vapor
Flash Electrically Erasable Programmable Read-Only Memory	FEEPROM	
Front Electronic Module	FEM	
Flash Erasable Programmable Read-Only Memory	FEPRM	
Frequency Modulation	FM	
Fuel Pump Driver Module	FPDM	
Fuel Rail Pressure	FRP	
Generic Electronic Module	GEM	
Ground	GND	Electrical conductor used as a common return for an electrical circuit or circuits, and with a relative zero potential
Global Positioning System	GPS	
Global System for Mobile Communication	GSM	
Gross Vehicle Weight	GVW	
Heated Oxygen Sensor	HO2S	Electrically heated oxygen sensor which induces fuelling corrections
Hydrofluorocarbon	HFC	
High tension	HT	
Hydrocarbon	HC	
Idle Air Control	IAC	Stepper motor driven device which varies the volume of air by-passing the throttle to maintain the programmed idle speed
Intake Air Temperature	IAT	Temperature of intake air
Inertia Fuel Shut-off	IFS	An inertia system that shuts off the fuel supply when activated by pre-determined force limits brought about by (e.g.) collision
Input Shaft Speed	ISS	Indicates input shaft speed
Key On, Engine Off	KOEO	
Key On, Engine Running	KOER	
Kilogram (mass)	kg	
Kilogram (force)	kgf	
Kilogram force per square centimeter	kgf/cm ²	
Kilometer	km	
Kilometer per hour	km/h	
Kilopascal	kPa	
Kilovolt	kV	
Knock Sensor	KS	Sensor which detects the onset of detonation, and signals the ECM to retard the ignition

Term(s)	Acronym/Unit /Abbreviation	Definition
Liquid Crystal Display	LCD	Optical digital display system, to which applied voltage varies the way the crystals reflect light, thereby modifying the display
Lighting Control Module	LCM	
Light Emitting Diode	LED	
Low Tension	LT	Primary circuit of the ignition system, linking the battery to the primary winding in the ignition coil
Left-Hand	LH	
Left-Hand Drive	LHD	
Mass Air Flow	MAF	System which provides information on the mass flow rate of the intake air to the engine
Manifold Absolute Pressure	MAP	Absolute pressure of the intake manifold air
Manifold Absolute Pressure and Temperature	MAPT	
Malfunction Indicator Lamp	MIL	A required on-board indicator to alert the driver of an emission related malfunction
Meter (measurement)	m	
Metric (screw thread, e.g. M8)	M	
Farad	F	Unit of electrical capacitance
Millimeter	mm	
Millimeter of mercury	mmHg	
Millisecond	ms	
Model year	MY	
Newton	N	SI unit of force. 1 N = 0.2248 pounds force
Newton Meter	Nm	SI unit of torque. Must not be confused with nm (nanometer)
Negative Temperature Coefficient	NTC	
Naturally aspirated	N/A	Fuelling system using intake air at atmospheric pressure; not supercharged or turbocharged
Noise, Vibration and Harshness	NVH	
North American Specification	NAS	Vehicles for sale in the USA and Canadian markets
On-Board Diagnostic	OBD	A system that monitors some or all computer input and output control signals. Signal(s) outside the pre-determined limits imply a fault in the system or a related system
Oxides of Nitrogen	Nox	
Oxygen Sensor	O2S	A sensor which detects oxygen content in the exhaust gases
On-board Refuelling Vapour Recovery	ORVR	
Output State Control	OSC	
Output Shaft Speed	OSS	
Passenger Air Bag Deactivation	PAD	
Pulsed Secondary Air Injection	PAIR	
Passive Anti-Theft System	PATS	
Positive Crankcase Ventilation	PCV	
Parameter Identification	PID	An index number referring to a parameter within a module without knowledge of its storage location
Park/Neutral Position	PNP	
Pulse Width Modulation	PWM	
Programmable Electronic Control Units System	PECUS	Process whereby a common ECM is programmed on the production line to suit the market requirements of a particular vehicle
Programmable Read-only Memory	PROM	ROM with some provision for setting the stored data after manufacture
Portable Support Electronics	PSE	
Power Steering Pressure	PSP	
Polytetrafluoroethylene	PTFE	
Random Access Memory	RAM	Fast access memory store which is accessible for entry or extraction of data
Read Only Memory	ROM	Fast access memory in which data is fixed and may not be changed
Restraints Control Module	RCM	Electronic module to support functionality of the Supplemental Restraints System
Radio Data System	RDS	
Rear Electronic Module	REM	
Remote Keyless Entry	RKE	
Right-hand	RH	
Right-hand drive	RHD	
Research Octane Number	RON	
Rear Seat Module	RSM	Electronic module to support functionality of rear seats
Supercharger	SC	An intake system which utilizes a supercharger (mechanically driven device that pressurizes intake air, thereby increasing density of charge air and the consequent power output from a given displacement)
Serial Communications Link	SCL	
Standard Corporate Protocol	SCP	A high-speed, serial communications system linking all body system control modules. Control messages and data are passed between modules at up to 786 messages per second
Supplemental Restraints System	SRS	
Shift Solenoid	SS	Controls shifting in an automatic transmission

Term(s)	Acronym/Unit /Abbreviation	Definition
Seat Control Module	SCM	Module controlling the seat motor systems (not electric raise/lower-only seats)
Secondary Air Injection	AIR	System used for a period of time each time the engine is started, unless certain temperature criteria are met. Pumps air directly into the exhaust system which generates extra heat and reduces the time taken for the catalytic converters to reach operating temperature
Service Repair Operation (number)	SRO	Number generated by Jaguar Methods & Techniques system which relates to the time allowed to complete a repair operation. Further information on the system can be found in the separate Jaguar Publications (for each model range) entitled 'Repair Operation Times'
Society of Automotive Engineers	SAE	
Timing/Coast Clutch Solenoid	T/CCS	
Torque Converter Clutch	TCC	
Transmission Control Indicator Lamp	TCIL	
Throttle Position	TP	
Top Dead Center	TDC	
Transmission Control Module	TCM	Controls the shifting pattern of the (automatic) transmission
Transmission Control Switch	TCS	Modifies the operation of electronically controlled transmissions
Transmission Fluid Temperature	TFT	Indicates temperature of transmission fluid
Transmission Range	TR	The range in which the transmission is operating
Turbine Shaft Speed	TSS	Indicates rotational speed of transmission output shaft or turbine shaft
Variable Assist Power Steering	VAPS	
Variable Camshaft Timing	VCT	A system by which the relationship of the crankshaft and camshaft may be altered during engine running
Vehicle Identification Number	VIN	Number assigned to the vehicle by the manufacturer, primarily for licensing and identification purposes
Vehicle Speed Sensor	VSS	Sensor which provides vehicle speed information
Worldwide Diagnostic System	WDS	Jaguar approved diagnostic system
Wide Open Throttle	WOT	Full throttle position

General Information - Health and Safety Precautions

Description and Operation

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included in the following list either in their own right or as an ingredient in a sealer or adhesive.

Acids and Alkalis

See also Battery Acids.

e.g. caustic soda, sulphuric acid.

Used in batteries and cleaning materials.

Irritant and corrosive to the skin, eyes, nose and throat. Cause burns. Can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Ensure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

See also Fire, Chemical Materials - General

Highly flammable, explosive – observe No Smoking policy.

Used as a part of the Supplemental Restraint System (SRS), mounted in various positions around the vehicle.

The inflator contains a high-energetic propellant which, when ignited, produces a VERY HOT GAS (2500° C).

The gas generant used in air bags is Sodium Azide. This material is hermetically sealed in the module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with gas generant.

- Wash affected areas thoroughly with water
- Seek medical assistance if necessary

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any SRS components. To deplete the backup power supply energy, disconnect the battery negative cable and wait for one minute. Failure to follow this instruction may result in personal injury.

• **NOTE:** The storage, transportation, disposal and/or recycling of air bag modules must be carried out in accordance with all applicable federal, state and local regulations including, but not limited to, those governing building and fire codes, environmental protection, occupational health and safety and transportation.

Air Bags - Do's

- Do store in an air bag safe when not installed to the vehicle.
- Do store modules in an upright position
- Do keep modules dry
- Do carry modules with the cover side pointing away from the body
- Do place modules with their cover side upwards
- Do carefully inspect modules for damage
- Do stand to one side when connecting modules
- Do make sure all test equipment is properly calibrated and maintained
- Do wash you hands after handling deployed air bags
- Do wear safety glasses when carrying out repairs to the SRS or when handling an air bag module
- Only carry out a system test with the air bag modules fully installed
- Do inspect the condition of the impact sensor mounting bracket and sensor flylead if the vehicle has been involved in an impact. Replace if damaged, even if there has been no deployment.

Air Bags - Do Nots

- Do not store highly flammable material together with modules or gas generators
- Do not store gas generators at temperatures exceeding 80° C
- Do not store modules upside down
- Do not attempt to open a gas generator housing
- Do not expose gas generators to open flame or sources of heat
- Do not place anything on top of a module cover
- Do not use damaged modules
- Do not handle a deployed device or gas generator for at least 20 minutes

- Do not probe air bag module electrical connectors or any other SRS component

Air Conditioning Refrigerant

See also Chlorofluorocarbon, Chemical Materials

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution and should not be rubbed. SEEK MEDICAL ASSISTANCE IF NECESSARY.

Air Conditioning Refrigerant - Do Not

- Do not expose refrigerant bottles to sunlight or heat
- Do not expose refrigerant bottles to frost
- Do not drop refrigerant bottles
- Do not vent refrigerant to atmosphere under any circumstance
- Do not mix refrigerants i.e. R12 (Freon) and R134a

Antifreeze

See also Fire, Solvents.

e.g. isopropanol, ethylene glycol, methanol.

Highly flammable, flammable, combustible.

Used in vehicle coolant systems, brake air pressure systems, screenwash solutions.

Vapors may be given off from coolant antifreeze (glycol) when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed can be fatal and medical attention should be sought immediately.

These products must not be used in any cooling or industrial water system which is connected or linked to general, food preparation or drinking water supplies.

Asbestos

Used in brake and clutch linings, transmission brake bands and gaskets. Jaguar original production and replacement items are asbestos free.

See also Warning Symbols on Vehicles at the end of this subsection.

Breathing asbestos dust may cause lung damage or, in some cases, cancer.

The use of drum cleaning units, vacuum cleaning or damp wiping is preferred.

Asbestos dust waste should be dampened, placed in a sealed container and marked to make sure safe disposal. If any cutting or drilling is attempted on materials containing asbestos the item should be dampened and only hand tools or low speed power tools used.

Battery Acids

See also Acids and Alkalis.

Gases released during charging are explosive. Never use naked flames or allow sparks near charging or recently charged batteries.

Ensure adequate ventilation.

Brake and Clutch Linings and Pads

See Asbestos.

Brake Fluids (Polyalkylene Glycols)

See also Fire.

Splashes to the skin and eyes may cause irritation. Avoid skin and eye contact as far as possible. Vapor inhalation hazards do not arise at ambient temperatures because of the very low vapor pressure.

Brazing

See Welding.

Chemical Materials

See also Legal Aspects.

Chemical materials such as solvents, sealers, adhesives, paints, resin foams, battery acids, antifreeze, brake fluids, fuels, oils and grease should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life-expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers
- Do remove chemical materials from the skin and clothing as soon as practical after soiling. Change heavily soiled clothing and have it cleaned
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes, and the breathing in of vapors, aerosols, dusts or fumes
- Do wash before breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials
- Do keep work areas clean, uncluttered and free from spills
- Do store chemical materials according to national and local regulations
- Do keep chemical materials out of the reach of children

Chemical Materials - Do Not's

- Do not mix chemical materials except under the manufacturer's instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together
- Do not spray chemical materials, particularly those based on solvents, in confined spaces e.g. when people are inside a vehicle
- Do not apply heat or flame to chemical materials except under the manufacturer's instructions. Some are highly flammable and some may release toxic or harmful fumes
- Do not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas, pits etc.
- Do not transfer chemical materials to unlabeled containers
- Do not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities
- Do not use emptied containers for other materials except when they have been cleaned under supervised conditions
- Do not sniff or smell chemical materials. Brief exposure to high concentrations of fumes can be toxic or harmful

Chlorofluorocarbons (CFC)

There is concern in the scientific community that CFCs and Halons are depleting the upper ozone layer which filters out harmful ultraviolet radiation. Decreased filtration of ultraviolet radiation may result in increases in skin cancer, cataracts and immune system suppression in humans, as well as decreased productivity of crops and aquatic systems.

CFCs are used primarily as refrigerants in vehicle air conditioning systems and as aerosol propellants. Halons are used as fire extinguishants.

Jaguar supports worldwide elimination of CFC usage and it is recommended that Company subsidiaries and affiliates should phase out CFC usage as soon as acceptable substitutes are commercially available.

Clutch Fluids

See Brake fluids.

Clutch Linings and Pads

See Asbestos.

Corrosion Protection Materials

See also Solvents, Fire.

Highly flammable, flammable – observe No Smoking policy.

These materials are varied and the manufacturer's instructions should be followed. They may contain solvents, resins, petroleum products etc. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Cutting

See Welding.

Dewaxing

See Solvents and Fuels (Kerosene).

Dusts

Powder, dusts or clouds may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and/or sources of ignition.

Electric Shock

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Ensure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Ensure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged.

Ensure that electrical equipment and flexes do not come into contact with water.

Ensure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Ensure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Ensure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim
- If this is not possible push or drag the victim from the source of electricity using dry non-conductive material
- Commence resuscitation if trained to do so
- SUMMON MEDICAL ASSISTANCE

Engine Oils

See Lubricants and Grease.

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasolene (petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Fibre Insulation

See also Dusts.

Used in noise and sound insulation.

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

See also Welding, Foams, Legal Aspects.

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Ensure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

Individuals affected by inhalation of gases, fumes etc. should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomer

See Viton.

Foams - Polyurethane

See also Fire.

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Follow manufacturer's instructions.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapor/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be conducted with extraction ventilation.

Freon

See Air Conditioning Refrigerant.

Fuels

See also, Fire, Legal Aspects, Chemicals and Solvents.

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - observe No Smoking policy.

Swallowing can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Aspiration of liquid into the lungs e.g. through vomiting, is a very serious hazard.

Gasoline dries the skin and can cause irritation and dermatitis on prolonged or repeated contact. Liquid in the eye causes severe pain.

Motor gasoline may contain appreciable quantities of benzene, which is toxic upon inhalation, and the concentration of gasoline vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Ensure there is adequate ventilation when handling and using gasoline. Great care must be taken to avoid the serious consequences of inhalation in the event of vapor build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline storage tanks.

Gasoline should not be used as a cleaning agent. It must not be siphoned by mouth. See First Aid.

Gas - oil (Diesel Fuel)

See warnings and cautions in relevant manual sections.

Combustible.

Gross or prolonged skin contact with high boiling point gas oils may also cause serious skin disorders including skin cancer.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - observe No Smoking policy.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

Gas Cylinders

See also Fire.

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 13.790 kPa, (2000 lb/in²) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow, or direct sunlight. Fuel gases (e.g. acetylene and propane) should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines, and to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

Gases

See Gas Cylinders.

Gaskets (Fluoroelastomer)

See Viton.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never over – load equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment, working with asbestos-based materials or using spraying equipment.

Ensure adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

See also Lubricants and Greases.

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, e.g. diesel injector, at the skin as the fluid may penetrate to the under - lying tissue etc., and cause serious injury.

Halon

See CFCs.

Legal Aspects

Many laws and regulations make requirements relating to health and safety in the use and disposal of materials and equipment in workshops. Some of these laws which apply in the UK are listed. Similar laws exist for other territories:

- The Factories Act (1961)
- The Asbestos Regulations (1969)
- Highly Flammable Liquids and Liquefied Petroleum Gases Regulations (1972)
- Control of Pollution Act (1974)
- Health and Safety at Work Act (1974)
- The Classification, Packaging and Labelling of Dangerous Substances Regulations (1978, 1981, 1983, 1984)
- Control of Lead at Work Regulations (1980)
- Control of Substances Hazardous to Health (COSHH) Regulations (1989)
- Abrasive Wheels Regulations (1970)
- Reporting of injuries, diseases and dangerous occurrences regulations 1985 (RIDDOR)

Workshops should be familiar, in detail, with these and associated laws and regulations.

Consult the local factory inspectorate if in any doubt.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with mineral oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

There are publications describing the problems and advising on precautionary measures. For the UK a typical Health and Safety Executive publication is: SHW 397: Cautionary Notice: Effects of mineral oil on the skin.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils
- Wear protective clothing, including impervious gloves where practicable

- Do not put oily rags into pockets
- Avoid contaminating clothing with oil
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to enable easier removal of dirty oil and grease from the skin
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay
- Where practical, degrease components prior to handling
- Where there is a risk of eye contact, eye protection should be worn, for example, goggles or face shields; in addition an eye wash facility should be provided

Environmental Precautions

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. In the UK the heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of approved appliances.

Dispose of used oil and used oil filters through authorized waste disposal contractors or licensed waste disposal sites, or to the waste oil reclamation trade, batteries should also be disposed off under similar arrangements. If in doubt, contact the relevant local authority for advice on disposal facilities.

It is illegal to pour used oil, antifreeze and automatic transmission fluid on to the ground, down sewers, drains, or into water courses.

Noise

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Noise Insulation Materials

See Foams, Fibre Insulation.

O-Rings (Fluoroelastomer)

See Viton.

Paints

See also body and paint manual.

See also Solvents, Chemical Materials.

Highly flammable, flammable - observe No Smoking policy

Pressurized Equipment

See High Pressure Air, Lubrication and Oil Test Equipment.

Solder

Solders are a mixture of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease etc. and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

See also Chemical Materials, Fuels (Kerosene), Fire.

e.g. acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and de-waxing materials, paints, plastics, resins, thinners etc.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure to high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs (e.g. through vomiting) is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Ensure good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, e.g. paints, adhesive, coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturer's instructions.

Sound Insulation

See Fibre Insulation, Foams.

Suspended Loads

CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load e.g. suspended engine, etc.

Always make sure that lifting equipment such as jacks, hoists, axle stands, slings, etc., are adequate and suitable for the job, in good condition and regularly maintained.

Transmission Brake Bands

See Asbestos.

Underseal

See Corrosion Protection.

Viton

In common with many other manufacturers' vehicles, some components installed to the Jaguar range have 'O' rings, seals or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. It is commonly used for 'O' rings, gaskets and seals of all types. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecnoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400° C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the body.

'O' rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected 'O' ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious and assume that the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralize the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

See also Fire, Electric Shock, Gas Cylinders.

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding (and cutting).

Resistance Welding (Spot Welding)

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultraviolet radiation which may cause arc-eye and skin burns to the operator and to

other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultraviolet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, E.G. BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

The most commonly found decals are reproduced below together with an explanation of the warnings.

VUJ0000269

1. Components or assemblies displaying the warning triangle and open book symbol advise consultation of the relevant section of the owners handbook before touching or attempting adjustments of any kind.

VUJ0000270

2. Components or assemblies displaying the warning triangle with the electrified arrow and open book symbol give warning of inherent high voltages. Never touch these with the engine running or the ignition switched on. See Electric Shock in this subsection.

VUJ0000271

3. 3. Jaguar vehicles and replacement parts which contain asbestos are identified by this symbol. See Asbestos in this subsection.

VUJ0000272

4. 4. Components or assemblies displaying this symbol give warning that the component contains a corrosive substance. See Acids and Alkalis in this subsection.

VUJ0000273

5. 5. Vehicles displaying the caution circle with a deleted lighted match symbol, caution against the use of naked lights or flames within the immediate vicinity due to the presence of highly flammable or explosive liquids or vapors. See Fire in this subsection.

VUJ0002037

6. 6. All vehicles with the passenger air bag installed from the factory have a warning sticker attached to the instrument panel, prohibiting the use of rear facing child seats in the front seating position. Failure to follow this instruction may result in personal injury.

White Spirit

See Solvents.

Safety Precautions

- WARNINGS:

Working on the fuel system results in fuel and fuel vapor being present in the atmosphere. Fuel vapor is extremely flammable, hence great care must be taken whilst working on the fuel system. Adhere strictly to the following precautions:

- Do not smoke in the work area
- Display 'no smoking' signs around the area
- Disconnect the battery before working on the fuel system
- Do not connect/disconnect electrical circuits, use electrical equipment or other tools or engage in working practices which in any way may result in the production of sparks
- Ensure that a CO² fire extinguisher is close at hand
- Ensure that dry sand is available to soak up any fuel spillage
- Empty fuel using suitable fire proof equipment into an authorized explosion proof container
- Do not empty fuel while working in a workshop or a pit
- Ensure that working area is well ventilated
- Ensure that any work on the fuel system is only carried out by experienced and well qualified maintenance personnel
- Ensure that fume extraction equipment is used where appropriate

Fume extraction equipment must be in operation when solvents are used e.g. Trichloroethane, white spirit, sbp3, methylene chloride, perchlorethylene. Do not smoke in the vicinity of volatile degreasing agents.

Whenever possible, use a ramp or pit whilst working beneath a vehicle, in preference to jacking. Position chocks at the wheels as well as applying the parking brake. Never rely on a jack alone to support a vehicle. Use axle stands, or blocks carefully placed at the jacking points, to provide a rigid location. Check that any lifting equipment used has adequate capacity and is fully serviceable. Ensure that a suitable form of fire extinguisher is conveniently located. When using electrical tools and equipment, inspect the power lead for damage and check that it is properly earthed. Disconnect the earth (grounded) terminal of the vehicle battery. Do not disconnect any pipes of the air conditioning refrigeration system unless you are trained and instructed to do so. A refrigerant is used which can cause blindness if allowed to come into contact with the eyes. Ensure that adequate ventilation is provided when volatile degreasing agents are being used.

Adhere strictly to handling and safety instructions given on containers and labels. Keep oils and solvents away from naked flames and other sources of ignition. Do not apply heat in an attempt to free seized nuts or fittings; as well as causing damage to protective coatings, there is a risk of damage from stray heat to electronic equipment and brake lines. Do not leave tools, equipment, spilt oil etc. around the work area. Wear protective overalls and use barrier cream when necessary.

Environmental Protection

In some countries it is illegal to pour used oil onto the ground, down sewers or drains, or into water courses. The burning of used engine oil in small space heaters or boilers is not recommended unless emission control equipment is installed. Dispose of used oil through authorized waste disposal contractors, to licensed waste disposal sites or to the waste oil reclamation trade. If in doubt, contact the Local Authority for advice on disposal facilities.

General Information - How To Use This Manual

Description and Operation

Copyright Statement

Copyright. © Jaguar Cars Ltd. 2005

All rights reserved. No part of this publication may be reproduced, stored in a retrieval system or transmitted in any form, electronic, mechanical, photocopying, recording or other means, without prior written permission from the Service Division of Jaguar Cars Ltd.

Workshop Manual Organization

This manual covers descriptive, diagnostic (including OBD), and repair aspects to service the vehicle effectively.

The manual is arranged in sections, each section dealing with a specific part of a vehicle system. For example, Section 412-03 [Air Conditioning] covers air conditioning, which is part of the climate control system.

The first digit of the section number indicates the group (in the above example this being Electrical). There are five groups:

- General Information.
- Chassis.
- Powertrain.
- Electrical.
- Body and Paint.

The second and third digits of the section number indicate the vehicle system (12 in the above example being Climate Control).

The last two digits of the section number indicate the part of the system covered by the section (03 in the example denotes Air Conditioning).

General Information - Important Safety Instructions

Description and Operation

Safety Notice

Appropriate service methods and correct repair procedures are essential for the safe, reliable operation of all motor vehicles, as well as the safety of the person doing the work. This manual provides general directions for accomplishing service and repair work with tested effective techniques. Following them will help assure reliability.

There are numerous variations in procedures, techniques, tools, and parts for servicing vehicles, as well as in the skill of the person doing the work. This manual cannot possibly anticipate all such variations and provide advice or cautions as to each. Accordingly, anyone who departs from the instructions provided in the manual must first establish that neither personal safety or vehicle integrity is compromised from choices of methods, tools or parts.

General Information - Petrol and Petrol-Ethanol Fuel Systems Health and Safety Precautions

Description and Operation

• WARNINGS:

Fuel may not give adequate warning before toxic or harmful effects arise.

Exposure to fuel can be harmful and can cause severe health damage or death.

Extreme care must be exercised when handling hot fluids. Always wash off spilled fluids from affected areas of skin immediately.

Highly flammable mixtures are always present and may ignite when working on fuel systems. Do not allow naked flames, sparks or lighted substances to come near fuel related components.

Fuel must not be used as a cleaning agent.

Keep fuel containers tightly closed, out of direct sunlight and in a cool area. Keep away from heat sources, ignition sources and oxidizing agents.

SKIN CONTACT: Excessive or prolonged skin contact with diesel fuel may cause serious skin disorders including skin cancer.

SKIN CONTACT: Fuel is mildly irritating to the skin and may cause dermatitis due to defatting effect. Remove contaminated clothing. Wash affected areas of skin with soap and water. Seek medical attention for any persistent skin irritation or abnormality. Wash contaminated clothing before reuse.

EYE CONTACT: Fuel is mildly irritating to the eyes. Flush with plenty of running water, blinking as often as possible. Do not force the eyelid open. Seek medical attention for any persistent eye irritation or abnormality.

SWALLOWED: Fuel is moderately toxic and tends to foam on vomiting. If drawn into the lungs, inflammation may develop. Do not induce vomiting. If spontaneous vomiting occurs place the victim in a forward position to reduce the risk of fuel being drawn into the lungs. Give nothing by mouth. If breathing but unconscious, place in the recovery position. If breathing has stopped, apply artificial respiration. Seek immediate medical attention.

INHALED: Fuel is toxic to the respiratory and other body systems. Exposure may result in various symptoms including drowsiness, unconsciousness or severe health damage. Move a victim to fresh air. Keep a victim warm and at rest. If unconscious, place in the recovery position. If not breathing, apply artificial respiration. Give cardiac massage if necessary. Seek immediate medical attention.

• CAUTIONS:

Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components.

Make sure that the workshop area in which the vehicle is being worked on is as clean and as dust free as possible.

General Information - Solvents, Sealants and Adhesives

Description and Operation

WARNING: Always handle all solvents, sealers and adhesives with extreme care. Some contain chemicals or give off fumes which can be dangerous to health. Always follow the manufacturers instructions. If in doubt about any substance, particularly a solvent, DO NOT use it.

CAUTION: If in doubt about the suitability of any proprietary solvent or sealer for a particular application, contact the manufacturer of the product for information regarding storage, handling and application.

The Solvents, Sealers and Adhesives subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken.

Adhesives and Sealers

Highly flammable, flammable, combustible – observe No Smoking policy.

Generally should be stored in 'No Smoking' areas. Cleanliness and tidiness in use should be observed e.g. disposable paper covering benches; should be dispensed from applicators where possible; containers, including secondary containers, should be labelled appropriately.

Solvent - based Adhesives/Sealers - See Solvents

Follow manufacturer's instructions.

Water - based Adhesives/Sealers

Those based on polymer emulsions and rubber latexes may contain small amounts of volatile toxic and harmful chemicals. Skin and eye contact should be avoided and adequate ventilation provided during use.

Hot Melt Adhesives

In the solid state, they are safe. In the molten state they may cause burns and health hazards may arise from the inhalation of toxic fumes.

Use appropriate protective clothing and a thermostatically controlled heater with a thermal cut - out and adequate extraction.

Resin - based Adhesives/Sealers e.g. Epoxide and Formaldehyde Resin - based

Mixing should be carried out in well ventilated areas, as harmful or toxic volatile chemicals may be released.

Skin contact with uncured resins and hardeners can result in irritation, dermatitis, and absorption of toxic or harmful chemicals through the skin. Splashes can damage the eyes.

Provide adequate ventilation and avoid skin and eye contact.

Anaerobic, Cyanoacrylate (Super - glues) and other Acrylic Adhesives

Many are irritant, sensitizing or harmful to the skin and/or respiratory tract. Some are eye irritants.

Skin and eye contact should be avoided and the manufacturer's instructions followed.

Cyanoacrylate adhesives (super-glues) MUST NOT contact the skin or eyes. If skin or eye tissue is bonded, cover with a clean moist pad and seek immediate medical attention. Do not attempt to pull tissue apart. Use in well ventilated areas as vapors can cause irritation to the nose and eyes.

For two - pack systems see Resin - based and Isocyanate Adhesives/Sealers.

Isocyanate (Polyurethane) Adhesives/Sealers

See also Resin - based Adhesives

Individuals suffering from asthma or respiratory allergies should not work with or near these materials as sensitivity reactions can occur.

Over exposure is irritating to the eyes and respiratory system. Excessive concentrations may produce effects on the nervous system including drowsiness. In extreme cases, loss of consciousness may result. Long term exposure to vapor concentrations may result in adverse health effects.

Prolonged contact with the skin may lead to skin irritation and, in some cases, dermatitis.

Splashes entering the eye will cause discomfort and possible damage.

Any spraying should preferably be carried out in exhaust ventilated booths removing vapors and spray droplets from the breathing zone.

Wear appropriate gloves, eye and respiratory protection.

General Information - Standard Workshop Practices

Description and Operation

Protecting the Vehicle

Always install covers to protect the fenders before commencing work in the engine compartment. Always install the interior protection kit, wear clean overalls and wash hands or wear gloves before working inside the vehicle. Avoid spilling hydraulic fluid, antifreeze or battery acid on the paintwork. In the event of spillage, wash off with water immediately. Use polythene sheets in the luggage compartment to protect carpets. Always use the recommended service tool, or a satisfactory equivalent, where specified. Protect temporarily exposed screw threads by replacing nuts or installing caps.

Vehicle in Workshop

When working on a vehicle in the workshop always make sure that:

- The parking brake is applied or the wheels are securely chocked to prevent the vehicle moving forwards or backwards
- If the engine is to be run, there is adequate ventilation, or an extraction hose to remove exhaust fumes is installed
- There is adequate room to jack up the vehicle and remove the wheels, if necessary
- Fender covers are always installed if any work is to be carried out in the engine compartment
- The battery is disconnected if working on the engine, underneath the vehicle, or if the vehicle is jacked up

CAUTION: When electric arc welding on a vehicle, always disconnect the generator wiring to prevent the possibility of a surge of current causing damage to the internal components of the generator.

- If using welding equipment on the vehicle, ensure a suitable fire extinguisher is readily available.

General Information - Symbols Glossary

Description and Operation

Symbols are used inside the graphics and in the text area to enhance the information display.

Movement Symbols

Movement symbols provide detailed information to a required component movement. These component movements can be rotational or 1-3 dimensional movements.

E 88969

Item	Part Number	Description
1	-	Minor component movement clockwise/counterclockwise
2	-	Major component movement clockwise/counterclockwise
3	-	Component movement to the left/right/up/down
4	-	Component movement towards/away
5	-	3 dimensional component movement
6	-	2 dimensional component movement
7	-	3 dimensional component rotation
8	-	3 dimensional component cycling

Turn Symbols

Turn symbols are used to provide further information on the direction or angle of component turns.

E 88970

Item	Part Number	Description
1	-	Turn the component clockwise through 45°
2	-	Turn the component counterclockwise through 45°
3	-	Turn the component clockwise through 90°
4	-	Turn the component counterclockwise through 90°
5	-	Turn the component clockwise through 180°
6	-	Turn the component counterclockwise through 180°
7	-	Turn the component clockwise through 2 complete turns
8	-	Turn the component counterclockwise through 2 complete turns

Steering Wheel Symbols

Steering wheel symbols are used to provide further information to a required steering wheel position or steering column lock status.

1

2

3

4

5

6

7

E 123751

Item	Part Number	Description
1	-	Steering wheel in straight ahead position
2	-	Steering column lock locked
3	-	Steering column lock unlocked
4	-	Turn the steering wheel to the 90° left position
5	-	Turn the steering wheel to the 90° right position
6	-	Turn the steering wheel to the left-hand end position
7	-	Turn the steering wheel to the right-hand end position

E 88971

Item	Part Number	Description
1	-	3, 4, 5-door body style
2	-	Wagon body style
3	-	Sports utility vehicle body style
4	-	Coupe body style
5	-	Convertible body style
6	-	Van body style
7	-	3, 4, 5-door body style - Top View
8	-	Wagon body style - Top View
9	-	Underview
10	-	Right-hand drive (RHD) vehicle
11	-	Left-hand drive (LHD) vehicle

Gearshift lever and selector lever position symbols

Gearshift lever and selector lever position symbols are used to show the lever position that is required to be selected to carry out a procedure step.

E88972

Item	Part Number	Description
1	-	Set the selector lever to the park (P) position
2	-	Set the selector lever to the reverse (R) position
3	-	Set the selector lever to the neutral (N) position
4	-	Set the selector lever to the drive (D) position
5	-	Set the selector lever with manual shift pattern to the park (D) position
6	-	Set the selector lever with manual shift pattern to the manual (M) position
7	-	Set the selector lever with manual shift pattern to the shift down (-) position
8	-	Set the selector lever with manual shift pattern to the shift up (+) position
9	-	Set the gearshift lever to the neutral (N) position
10	-	Further gearshift lever positions that may appear in illustrations

Screwdriver symbols

The screwdriver symbols are used to show which screwdriver bit is recommended to carry out a procedure step.

1

2

3

4

5

E88973

Item	Part Number	Description
1	-	Screwdriver
2	-	Cross bladed screwdriver
3	-	Flat bladed screwdriver
4	-	Hexagonal screwdriver
5	-	TORX screwdriver

Pliers symbols

The pliers symbols are used to show which pliers is recommended to carry out a procedure step.

1

2

3

4

5

6

7

E88974

Item	Part Number	Description
1	-	Combination pliers
2	-	Side cutter pliers
3	-	Securing ring pliers - inner
4	-	Securing ring pliers - outer
5	-	Hose clamp pliers
6	-	Locking pliers
7	-	Long nose pliers

Drill symbols

The drill symbols are used to show which type and size of drill bit is recommended to carry out a procedure step.

E88975

Item	Part Number	Description
1	-	Drill bit with a specified diameter
2	-	Hole saw with a specified diameter
3	-	Stepped drill bit with a specified diameter
4	-	Tap with a specified diameter
5	-	Die with a specified diameter
6	-	Scraper for circular holes
7	-	Scraper for straight edges

Cutting tool symbols

The cutting tool symbols are used to show which type of cutting tool is recommended to carry out a procedure step.

1

2

3

4

5

6

7

8

9

10

11

12

E88976

Item	Part Number	Description
1	-	Cutting knife
2	-	Air body saw
3	-	Scissors
4	-	Grinder
5	-	Jig saw
6	-	Plasma cutter
7	-	Sanding Paper
8	-	Drill through the shown number of body panel layers with a specified diameter
9	-	Drill through the shown number of body panel layers with a suitable diameter
10	-	Drill through 1 body panel layer with a specified diameter
11	-	Drill through 1 body panel layer with a suitable diameter
12	-	Wire brush

Apply Chemical or load symbols

The apply chemical or load symbols are used to show where to apply which type of chemical or load to carry out a procedure step.

E88977

Item	Part Number	Description
1	-	Apply a bead from the specified tube
2	-	Apply a bead from the specified cartridge
3	-	Apply the specified chemical with a brush
4	-	Apply the specified load to the specified component
5	-	Apply a bead with a specific diameter from the specified tube
6	-	Apply a bead with a specific diameter from the specified cartridge
7	-	Apply the specified chemical with a roller
8	-	Apply hot glue to the specified component

9	-	Apply the specified amount of fluid from the fluid can
10	-	Apply fluid from the fluid can
11	-	Clean the specified component with the specified material
12	-	Apply a broken bead from the specified tube
13	-	Apply the specified chemical from a spray can
14	-	Apply the specified lubricant to the specified component
15	-	Apply spot welds to the specified component
16	-	Apply a continuous weld to the specified component
17	-	Handle the fluid using a syringe
18	-	Extract the specified amount of fluid using a syringe

Measurement symbols

The measurement symbols are used to show where to measure which type of measurement to carry out a procedure step.

1

2

5

6

7

8

9

10

11

12

13

14

15

Item	Part Number	Description
1	-	Measure the current using a digital multimeter
2	-	Measure the voltage using a digital multimeter
3	-	Measure the resistance using a digital multimeter
4	-	Measure the length/distance
5	-	Check that the specified pressure is available using a suitable pressure gauge
6	-	Measure the pressure at the specified port using a suitable pressure gauge
7	-	Measure the time using a suitable stopwatch
8	-	Wait for the specified period of time
9	-	The specified task requires the specified minimum temperature
10	-	The specified task requires the specified maximum temperature not to be exceeded
11	-	The specified task requires the specified temperature range
12	-	The specified task requires the specified temperature
13	-	Measure and check for the specified value using a dial indicator gauge
14	-	Measure and check for the specified MAX value using a dial indicator gauge
15	-	Measure and check for the specified MIN value using a dial indicator gauge

General equipment symbols

The general equipment symbols are used to show where to use which type of general equipment to carry out a procedure step.

1

2

3

4

E88979

Item	Part Number	Description
1	-	Hot air gun
2	-	Soldering iron
3	-	Scraper
4	-	Scriber
5	-	Securing strap
6	-	File with a specified size
7	-	Center punch
8	-	Marker
9	-	Metal inert gas (MIG) welding equipment
10	-	Hose clamp
11	-	Interior trim remover
12	-	Vacuum cleaner

13	-	Strap wrench
14	-	Wedge
15	-	Pin Punch

Material symbols

The material symbols are used to show where to use which type of material to carry out a procedure step.

E88980

Item	Part Number	Description
1	-	Remove/Install the specified blind rivet
2	-	Apply tape to the specified component/area
3	-	Remove/Install the specified cable tie

Miscellaneous symbols

These symbols provide further information that is required to carry out a procedure step.

E88981

Item	Part Number	Description
1	-	Set the ignition switch to the 0 position
2	-	Set the ignition switch to the II position
3	-	The procedure step requires the aid of the specified number of supporting technicians
4	-	Self contained breathing apparatus
5	-	General prohibition used in combination with another symbol
6	-	Do not use power tools
7	-	Visual check
8	-	Noise check
9	-	Dispose the specified component
10	-	Replaced by item 9 (Dispose the specified component)
11	-	Set the engine speed to the specified value
12	-	Fully apply the parking brake lever

13	-	Fully release the parking brake lever
14	-	Do not dispose of batteries into the waste bin
15	-	Visual check using a mirror
16	-	Area/component must be dry

Mandatory Protective equipment - Health and safety symbols

The protective equipment symbols advise to use a mandatory protective equipment to avoid or at least reduce possible health and safety risks.

E 89019

Item	Part Number	Description
1	-	Wear protective gloves
2	-	Wear face guard
3	-	Wear safety goggles
4	-	Wear ear protectors
5	-	Wear safety goggles and ear protectors
6	-	Wear a respirator

Prohibition - Health and safety symbols and component damage

The prohibition symbols are used to prohibit the specified actions to avoid or at least reduce possible component damage and health and safety risks.

E89020

Item	Part Number	Description
1	-	General prohibition symbol
2	-	No naked flames
3	-	No smoking
4	-	No water
5	-	Do not touch
6	-	Do not switch
7	-	No grinding

Warning symbols - Health and safety and component damage

The warning symbols are used to advise on hazardous conditions to avoid or at least reduce possible component damage and health and safety risks.

E 89021

Item	Part Number	Description
1	-	Hazardous voltage/Electrical shock/Electrocution
2	-	Fire Hazard/Highly flammable
3	-	Burn hazard/Hot surface
4	-	Automatic start-up
5	-	Toxic
6	-	Explosive material
7	-	Battery hazard
8	-	Corrosive material
9	-	Lifting hazard
10	-	Hand crush/Force from above
11	-	Cutting of fingers or hand
12	-	Pressure hazard

Control Diagram symbols - Description and Operation procedures

These symbols provide further information on the type of connectivity, direction of flow or type of data bus of a system.

E99427

Item	Part Number	Description
1	-	Mid-speed Controller Area Network (CAN)
2	-	High-speed Controller Area Network (CAN)
3	-	Local Interconnect Network (LIN)
4	-	Wires crossing not connected

General Information - Supplemental Restraint System (SRS) Health and Safety Precautions

Description and Operation

• WARNINGS:

Only qualified technicians are allowed to work on pyrotechnic components.

INHALED: Exposure to pyrotechnic residue may cause low blood pressure, severe headache, irritation of mucous membranes, fainting, shortness of breath or rapid pulse. Move a victim to fresh air. Seek immediate medical attention.

EYE CONTACT: Exposure to unburned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with plenty of cold running water for at least 15 minutes. Seek immediate medical attention.

EYE CONTACT: Exposure to burned pyrotechnic residue may cause irritation, burning and etching of the eyes. Flush immediately with diluted boric acid solution. Seek immediate medical attention.

SKIN CONTACT: Unburned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash immediately with plenty of soap and water. Seek medical attention.

SKIN CONTACT: Burned pyrotechnic residue may be rapidly absorbed through the skin in toxic quantities. Wash with plenty of water. Do not use soap. Seek medical attention.

SWALLOWED: Unburned pyrotechnic residue is extremely toxic. If conscious drink plenty of water then induce vomiting. Seek immediate medical attention. If unconscious, or in convulsions do not attempt to induce vomiting or give anything by mouth. Seek immediate medical attention.

SWALLOWED: Burned pyrotechnic residue is extremely toxic. Drink plenty of water and seek immediate medical attention.

The deployment key must only be accessible to authorized personnel.

Make sure that the deployment key remains removed from the deployment equipment except during deployment.

If permanently disabling or enabling the passenger air bag a new seat belt for vehicles without or with a passenger air bag must be installed.

Undeployed pyrotechnic components must not be deployed in the vehicle.

Pyrotechnic components must be deployed following local regulations.

Check thoroughly that no loose objects can be spread during the deployment of pyrotechnic components.

Pyrotechnic components must be transported following local regulations.

Never carry out any electrical measurement on disconnected, undeployed pyrotechnic components.

Pyrotechnic components must not be disassembled.

Pyrotechnic components are not interchangeable between vehicles.

Always carry a live air bag module away from the body with the air bag or trim cover pointing upwards.

Live air bag modules must be placed in a suitable cage when removed from the vehicle. The air bag or trim cover must be facing upwards.

Do not install a rearward facing child safety seat to the passenger seat with an activated passenger air bag.

• CAUTIONS:

Pyrotechnic components must not be subjected to temperatures higher than 110°C.

Never install aftermarket accessories to the vehicle on or adjacent to the supplemental restraint system module.

General Information - Road/Roller Testing

Description and Operation

Road or roller testing may be carried out for various reasons and a procedure detailing pre-test checks, through engine starting and stopping, pre-driving checks, on-test checks to final checks on completion of the test is given in this section.

Unless complete vehicle performance is being checked, the full road test procedure need not be carried out. Instead, those items particularly relevant to the system/s being checked can be extracted.

Pre - Test Checks

WARNING: If the brake system hydraulic fluid level is low, pedal travel is excessive or a hydraulic leak is found, do not attempt to road test the vehicle until the reason for the low fluid level, excessive pedal travel or hydraulic leak is found and rectified.

It is suggested that pre-test checks, and functional tests of those systems/circuits which affect the safe and legal operations of the vehicle, such as brakes, lights and steering, should always be carried out before the road or roller test.

- Engine oil level
- Engine coolant level
- Tires, for correct pressure, compatible types and tread patterns, and wear within limits
- There is sufficient fuel in the tank to complete the test
- All around the engine, transmission and under the vehicle for oil, coolant, hydraulic and fuel leaks. Make a note of any apparent leaks and wipe off the surrounding areas to make it easier to identify the extent of the leak on completion of the test

Starting the Engine

CAUTION: On initial drive away from cold and within the first 1.5 km (1 mile), do not depress accelerator pedal beyond half travel until the vehicle has attained a minimum speed of 25 km/h (15 miles/h). Never operate at high engine speed or with the accelerator pedal at full travel whilst the engine is cold.

With the ignition switched off, check:

- The parking brake is applied
- The transmission selector lever is in Park
- All instrument gauges (except fuel gauge) read zero

With the ignition switched on, check:

- Ignition controlled warning lamps come on
- Engine coolant temperature gauge registers a reading compatible with the engine coolant temperature
- Fuel gauge registers a reading appropriate to the fuel level in the tank
- The operation of the parking brake and brake fluid level warning lamps

On Road or Roller Test Check:

CAUTION: If road testing, check the brake operation while still travelling at low speed before continuing with the test. If the brakes pull to one side, or appear to be otherwise faulty, do not continue with the road test until the fault has been found and rectified.

- Initial gear engagement is smooth
- Parking brake control operates smoothly and the parking brake releases quickly and completely
- Transmission takes up the drive smoothly, without judder
- The engine power output is satisfactory, full power is achieved, acceleration is smooth and pedal operation not stiff or heavy, and engine speed returns to idle correctly
- There is no excessive or abnormally colored smoke from the engine under normal driving, heavy load or overrun conditions
- Steering operation, including power steering, is smooth, accurate, not excessively heavy or with excessive free play or vibration. Does not pull to one side and self centres smoothly after cornering
- Speedometer, oil pressure warning lamp, coolant temperature gauge and tachometer register the correct readings or operate correctly
- Switches and controls operate smoothly and positively, warning lamps operate correctly and the direction indicator control self cancels when the steering is returned to the straight ahead position
- Heating and ventilation systems work correctly and effectively
- Brake operation and efficiency

Brake Testing

WARNING: When brake testing, avoid breathing the smoke or fumes from hot brakes, this may contain asbestos dust which is hazardous to health, see Health and Safety Precautions.

Avoid brake testing on busy roads where it can cause inconvenience or danger to other road users.

CAUTION: Brake testing which includes heavy brake applications should not be carried out with new brake pads/discs or linings/drums until the components have bedded-in. New brake friction components will not reach full efficiency until the

bedding-in process is complete.

Test the brakes at several speeds within the normal operating range using both light and heavy pedal pressure. Note any tendency to snatch, pull or drag, and any undue delay in application or release.

Allow the vehicle to coast and note any tendency to pull to one side, or evidence that the brakes are binding.

After stopping the vehicle (not immediately after a period of heavy braking), carefully check the brake temperature. A disc which feels hot, or appreciably hotter than the others, indicates that the brake is binding.

After completion of the test, check for:

- Oil, coolant, hydraulic, air and fuel leaks
- Abnormal temperature of any moving components or assemblies, e.g. wheel hubs, transmission, axle etc., which might indicate over tightness or lack of lubrication

Identification Codes - Identification Codes

Description and Operation

Vehicle Identification Number (VIN)

The official Vehicle Identification Number (VIN) for title and registration purposes is stamped on a metal plate and fastened to the instrument panel. It is positioned close on the left-hand side of the vehicle and is visible from the outside.

The VIN is also located on the vehicle certification label.

Item	Part Number	Description
1	—	VIN (stamped)
2	—	Bar code label (USA)
3	—	VIN label (Europe/Rest of World shown)
4	—	VIN plate

Automatic Transmission Number

The serial number of the transmission unit is displayed on a metal label or bar code (if equipped) attached to the transmission casing.

Engine Number(s)

Engine Number - 2.7L Diesel

The serial number is stamped on an engine web on the right-hand side of the cylinder block behind the engine mounting.

Engine Number - 3.0L Diesel

The serial number is stamped on an engine web on the right-hand side of the cylinder block behind the engine mounting.

Engine Number - 3.0L

The engine number is contained on a bar code label on the front cover and is also stamped in the cylinder block casting on the left-hand side of the engine below the engine mounting.

Engine Number - 4.2L and 4.2L Supercharged

The serial number is stamped on an engine web on the left-hand side of the cylinder block behind the engine mounting. The emission code is also located here, on the transmission flange.

Engine Number - 5.0L and 5.0L Supercharged

The serial number is stamped on an engine web on the left-hand side of the cylinder block behind the engine mounting.

Jacking and Lifting - Jacking

Description and Operation

Safety Precautions

WARNING: The jack provided with the vehicle is intended to be used in an emergency for changing a deflated tire. To avoid damage to the vehicle, never use the jack to raise the vehicle for any other purpose. Refer to the Driver Handbook when using the jack supplied with the vehicle. Failure to follow these instructions may result in personal injury.

The following safety precautions must be observed when raising the vehicle to carry out service operations:

- Never rely on a jack alone to support a vehicle. Always use suitable vehicle stands to provide rigid support.
- When working beneath a vehicle, whenever possible use a vehicle hoist instead of a jack and vehicle stands.
- Make sure that the vehicle is standing on firm, level ground before using a jack.
- Do not rely on the parking brake alone; chock the wheels and put the automatic transmission into Park if possible.
- Check that any lifting equipment used has adequate capacity for the load being lifted and is in correct working order.

Jacking and Lifting - Lifting

Description and Operation

Lifting Points—Twin-Post Hoist and Floor Jack

- CAUTIONS:

Do not allow the hoist adapters to contact the steering linkage, suspension arms, stabilizer bar, rear subframe stabilizer brackets or to compress the lower suspension arm stabilizer bar insulator. Damage to the suspension, exhaust and steering linkage components may occur if care is not exercised when positioning the hoist adapters of two-post hoists prior to lifting the vehicle.

Never use the differential housing as a lift point. Damage to the differential housing and cover may occur.

When using a floor jack, a cushioned pad must be utilized to avoid body damage.

E30331

Vehicle Support Points

E30332

Vehicle Recovery

- NOTE: Prior to vehicle recovery, make sure the vehicle keys are available and the security system is disarmed.

Vehicle recovery methods are:

- By flat-bed transporter.
- By rear suspended tow.
- By rear suspended tow.

Transporter or Trailer Recovery

VJJ0001116

When the vehicle is being recovered by transporter or trailer:

- The parking brake must be applied and the wheels chocked.
- The gear selector lever must be in Neutral. Do not select Park on automatic transmission vehicles, as the parking lock mechanism may be damaged by the forward and backward rocking motion of the vehicle.
- The vehicle must be securely tied down to the transporter or trailer.

Rear Suspended Tow

VJJ0001117

When the vehicle is being recovered by rear suspended tow:

- The ignition key must be removed from the ignition switch to lock the steering.
- The rear wheels must be correctly positioned in the lifting cradle and securely tied down.

Emergency Towing

WARNING: If the engine is not running, the steering will become heavy and the force necessary to effectively apply the brakes will be greatly increased.

CAUTION: A vehicle with a defective transmission must be towed by rear suspended tow.

When the vehicle is being towed on its own wheels:

- Local regulations for the towing of vehicles must be followed. In some countries the registration number of the towing vehicle and an 'On Tow' sign or warning triangle must be displayed at the rear of the towed vehicle.
- The gear selector lever must be in Neutral.
- The ignition switch must be in position II to release the steering lock and make the direction indicators, horn and stop lamps operate.
- A distance of 0,8 km (0.5 mile) must not be exceeded.
- A speed of 48 km/h (30 mph) must not be exceeded.
- The tow rope must be attached to the front towing eye.

Noise, Vibration and Harshness - Noise, Vibration and Harshness (NVH)

Description and Operation

Noise, vibration and harshness (NVH) is becoming more important as vehicles become more sophisticated and passenger comfort levels increase. This section is designed to aid in the diagnosis, testing and repair of NVH concerns.

- Noise is defined as sounds not associated with the operation of passenger compartment equipment that interface with customer satisfaction.
- Vibration is defined as impulses felt by the customer that are not caused by road surface changes.
- Harshness is a ride quality issue where the customer feels that the vehicle response to the road surface is sharply transmitted to the customer.

Diagnostic Theory

Diagnosis is more than just following a series of interrelated steps in order to find the solution to the specific condition. It is a way of looking at systems that are not functioning the way they should and finding out why. Also it is knowing how the system should work and whether it is working correctly.

There are basic rules for diagnosis. If these rules are followed, the cause of the condition is usually found the first time through the system.

Know the System

- Know how the parts go together.
- Know how the system operates as well as its limits and what happens when the system goes wrong.
- Sometimes this means checking the system against one that is known to be working correctly.

Know the History of the System

A clue in any one of these areas may save time:

- How old or new is the system?
- What kind of treatment has it had?
- Has it been repaired in the past in such a manner that might relate to the present condition?
- What is the repair history?

Know the History of the Condition

- Did it start suddenly or appear gradually?
- Was it related to some other occurrence such as a collision or previous part renewal?
- Know how the condition made itself known; it may be an important clue to the cause.

Know the Probability of Certain Conditions Developing

- Look for the simple rather than the complex.
- For example:
 - Electrical conditions usually occur at connections rather than components.
 - An engine no-start is more likely to be caused by a loose wire or small adjustment rather than a sheared-off camshaft.
- Know the difference between impossible and improbable. Certain failures in a system can be improbable but still happen.
- New parts are just that, new. It does not mean they are always good functioning parts.

Do Not Cure the Symptom and Leave the Cause

Lowering the pressure in a front tire may correct the condition of a vehicle leaning to one side, but it does not correct the original condition.

Be Positive the Cause is Found

- Double check the findings.
- What caused a worn component?
- A loose transmission or engine mount could indicate that other mounts are also loose.

Diagnostic Charts

Charts are a simple way of expressing the relationship between basic logic and a physical system of components. They help discover the cause of a condition in the least time. Diagnostic charts combine many areas of diagnosis into one visual display:

- probability of certain things occurring in a system
- speed of checking certain components or functions before others
- simplicity of carrying out certain tests before others
- elimination of checking huge portions of a system by carrying out simple tests
- certainty of narrowing down the search to a small portion before carrying out in-depth testing

The fastest way to find a condition is to work with the tools that are available. This means working with proven diagnostic charts and the correct special equipment for the system.

Noise, Vibration and Harshness - Noise, Vibration and Harshness (NVH)

Diagnosis and Testing

Principle of Operation

For a detailed description of Noise, Vibration and Harshness issues, refer to the Description and Operation section of the workshop manual.

REFER to: [Noise, Vibration and Harshness \(NVH\)](#) (100-04 Noise, Vibration and Harshness, Description and Operation).

Inspection and Verification

1. **1.** Verify the customer's concerns by operating the vehicle to duplicate the condition.
2. **2.** Visually inspect the vehicle to determine any obvious cause(s) of the concern(s).
3. **3.** If the inspection reveals obvious causes that can be readily identified, repair as necessary.
4. **4.** If the concern(s) remains after the inspection, determine the symptom(s) and refer to the Symptom Chart.

How To Use This Diagnostic Procedure Section

- Noise, vibration and harshness (NVH) concerns have become more important as vehicles have become more sensitive to these vibrations. This section is designed as an aid to identifying these situations
- The section provides diagnostic procedures based on symptoms. If the condition occurs at high speed, for instance, the most likely place to start is under High Speed Shake
- The road test procedure will tell how to sort the conditions into categories and how to tell a vibration from a shake
- A series of Road Test Quick Checks is provided to make sure that a cause is either pinpointed or eliminated
- Name the condition, proceed to the appropriate section and locate the correct diagnosis. When the condition is identified, the job is partly done
- Follow the diagnostic procedure as outlined
- Quick Checks are described within the step, while more involved tests and adjustments are outlined in General Procedures
- Always follow each step exactly and make notes to recall important findings later

Customer Interview

The road test and customer interview (if available) provide information that will help identify the concerns and will provide direction to the correct starting point for diagnosis.

Identify the Condition

NVH problems usually occur in a number of areas:

- tires
- engine accessories
- suspension
- driveline
- air leakage (wind noise)
- squeaks and rattles
- heating ventilation and air conditioning (HVAC)
- electrical (e.g. motor noise)
- transmission
- engine

It is important, therefore, that an NVH concern be isolated into its specific area(s) as soon as possible. The easiest and quickest way to do this is to carry out the Road Test as outlined.

Noise Diagnostic Procedure

Non-Axle Noise

The five most important sources of non-axle noise are exhaust, tires, roof racks, trim and mouldings, and transmission.

Therefore, make sure that none of the following conditions are the cause of the noise before proceeding with a driveline tear down and diagnosis.

- Under certain conditions, the pitch of the exhaust may sound very much like gear noise. At other times, it can be mistaken for a wheel bearing rumble
- Tires, especially snow tires, can have a high pitched tread whine or roar, similar to gear noise. Radial tires, to some degree, have this characteristic. Also, any non-standard tire with an unusual tread construction may emit a roar or whine type noise
- Trim and mouldings can also cause whistling or a whining noise
- Clunk may be a metallic noise heard when the automatic transmission is engaged in reverse or drive, or it may occur when the throttle is applied or released. It is caused by backlash somewhere in the driveline
- Bearing rumble sounds like marbles being tumbled. This condition is usually caused by a damaged wheel bearing

Noise Conditions

- Gear noise is typically a howling or whining due to gear damage or incorrect bearing preload. It can occur at various speeds and driving conditions, or it can be continuous
- Chuckle is a particular rattling noise that sounds like a stick against the spokes of a spinning bicycle wheel. It

occurs while decelerating from approximately 64 km/h (40 miles/h) and can usually be heard all the way to a stop. The frequency varies with vehicle speed

- Knock is very similar to chuckle, though it may be louder and occurs on acceleration or deceleration. The tear down will disclose what has to be corrected

Check and rule out tires, exhaust and trim items before disassembling the transmission to diagnose and correct gear noise.

The noises described under Road Test usually have specific causes that can be diagnosed by observation as the unit is disassembled. The initial clues are the type of noise heard on the road test and the driving conditions.

Vibration Conditions

• **NOTE: New Constant Velocity (CV) joints should not be installed unless disassembly and inspection revealed unusual wear.**

Clicking, popping or grinding noises may be caused by the following:

- Cut or damaged CV joint boots resulting in inadequate or contaminated lubricant in the outboard or inboard CV joint bearing housings
- Loose CV joint boot clamps
- Another component contacting the rear drive half shaft
- Worn, damaged or incorrectly installed wheel bearing, suspension or brake component

Vibration at highway speeds may be caused by the following:

- Out-of-balance front or rear wheels
- Out-of-round tires
- Driveline imbalance
- Driveline run-out (alignment)

• **NOTE: Rear drive half shafts are not balanced and are not likely to contribute to rotational vibration disturbance.**

Shudder or vibration during acceleration (including from rest) may be caused by the following:

- Driveline alignment
- Excessively worn or damaged outboard or inboard CV joint bearing housing
- Excessively high CV joint operating angles caused by incorrect ride height. Check ride height, verify correct spring rate and check items under Inoperative Conditions
- Excessively worn driveshaft components

Leakage Conditions

1. **1.** Inspect the CV joint boots for evidence of cracks, tears or splits.
2. **2.** Inspect the underbody for any indication of grease splatter in the vicinity of the rear drive half shaft, outboard and inboard CV joint boot locations, which is an indication of CV joint boot or CV joint boot clamp damage.
3. **3.** Inspect the inboard CV joint bearing housing seal for leakage.

Inoperative Conditions

If a CV joint or rear drive half shaft pull-out occurs, check the following:

- suspension components for correct location, damage or wear
- bushings for wear
- subframe for damage
- bent or worn components
 - Stabilizer bar link
 - Left-hand rear suspension lower arm and bushing
 - Right-hand rear suspension lower arm and bushing
 - Rear wheel hub and rear drive half shaft

Road Test

A gear-driven unit will produce a certain amount of noise. Some noise is acceptable and may be audible at certain speeds or under various driving conditions as on a newly paved blacktop road. The slight noise is in no way detrimental and must be considered normal.

The road test and customer interview (if available) provide information needed to identify the condition and give direction to the correct starting point for diagnosis.

1. **1.** Make notes throughout the diagnosis routine. Make sure to write down even the smallest piece of information, because it may turn out to be the most important.
2. **2.** Do not touch anything until a road test and a thorough visual inspection of the vehicle have been carried out. Leave the tire pressures and vehicle load just where they were when the condition was first observed. Adjusting tire pressures, vehicle load or making other adjustments may reduce the conditions intensity to a point where it cannot be identified clearly. It may also inject something new into the system, preventing correct diagnosis.
3. **3.** Make a visual inspection as part of the preliminary diagnosis routine, writing down anything that does not look right. Note tire pressures, but do not adjust them yet. Note leaking fluids, loose nuts and bolts, or bright spots where components may be rubbing against each other. Check the luggage compartment for unusual loads.
4. **4.** Road test the vehicle and define the condition by reproducing it several times during the road test.

5. Carry out the Road Test Quick Checks as soon as the condition is reproduced. This will identify the correct diagnostic procedure. Carry out the Road Test Quick Checks more than once to verify they are providing a valid result. Remember, the Road Test Quick Checks may not tell where the concern is, but they will tell where it is not.

Road Test Quick Checks

1. 24-80 km/h (15-50 miles/h): With light acceleration, a moaning noise is heard and possibly a vibration is felt in the front floor pan. It is usually worse at a particular engine speed and at a particular throttle setting during acceleration at that speed. It may also produce a moaning sound, depending on what component is causing it. Refer to Tip-In Moan in the Symptom Chart.
2. Acceleration/deceleration: With slow acceleration and deceleration, a shake is sometimes noticed in the steering wheel/column, seats, front floor pan, front door trim panel or front end sheet metal. It is a low frequency vibration (around 9-15 cycles per second). It may or may not be increased by applying brakes lightly. Refer to Idle Boom/Shake/Vibration in the Symptom Chart.
3. High speed: A vibration is felt in the front floor pan or seats with no visible shake, but with an accompanying sound or rumble, buzz, hum, drone or booming noise. Coast with the clutch pedal depressed or shift control selector lever in neutral and engine idling. If vibration is still evident, it may be related to wheels, tires, front brake discs, wheel hubs or front wheel bearings. Refer to High Speed Shake in the Symptom Chart.
4. Engine rpm sensitive: A vibration is felt whenever the engine reaches a particular rpm. It will disappear in neutral coasts. The vibration can be duplicated by operating the engine at the problem rpm while the vehicle is stationary. It can be caused by any component, from the accessory drive belt to the torque converter which turns at engine speed when the vehicle is stopped. Refer to High Speed Shake in the Symptom Chart.
5. Noise/vibration while turning: Clicking, popping, or grinding noises may be due to a worn, damaged, or incorrectly installed front wheel bearing, rear drive half shaft or CV joint.
6. Noise/vibration that is road speed relative: This noise/vibration can be diagnosed independent of engine speed or gear selected (engine speed varies but torque and road speed remain constant). The cause may be a rear drive axle/differential whine.

Road Conditions

An experienced technician will always establish a route that will be used for all NVH diagnosis road tests. The road selected should be reasonably smooth, level and free of undulations (unless a particular condition needs to be identified). A smooth asphalt road that allows driving over a range of speeds is best. Gravel or bumpy roads are unsuitable because of the additional road noise produced. Once the route is established and consistently used, the road noise variable is eliminated from the test results.

- NOTE: Some concerns may be apparent only on smooth asphalt roads.

If a customer complains of a noise or vibration on a particular road and only on a particular road, the source of the concern may be the road surface. If possible, try to test the vehicle on the same type of road.

Vehicle Preparation

Carry out a thorough visual inspection of the vehicle before carrying out the road test. Note anything which is unusual. Do not repair or adjust any condition until the road test is carried out, unless the vehicle is inoperative or the condition could pose a hazard to the technician.

After verifying the condition has been corrected, make sure all components removed have been installed.

Lift Test

After a road test, it is sometimes useful to do a similar test on a lift.

When carrying out the high-speed shake diagnosis or engine accessory vibration diagnosis on a lift, observe the following precautions:

WARNING: If only one drive wheel is allowed to rotate, speed must be limited to 55 km/h (35 miles/h) indicated on the speedometer since actual wheel speed will be twice that indicated on the speedometer. Speed exceeding 55 km/h (35 miles/h) or allowing the drive wheel to hang unsupported could result in tire disintegration, differential failure, constant velocity joint and drive half shaft failure, which could cause serious personal injury and extensive vehicle damage. Failure to follow these instructions may result in personal injury.

CAUTION: The suspension should not be allowed to hang free. When the CV joint is run at a very high angle, extra vibration as well as damage to the seals and joints can occur.

The rear suspension lower arm should be supported as far outboard as possible. To bring the vehicle to its correct ride height, the full weight of the vehicle should be supported in the rear by floor jacks. REFER to: (100-02 Jacking and Lifting)

[Jacking](#) (Description and Operation),
[Lifting](#) (Description and Operation).

1. Raise and support the vehicle. REFER to: (100-02 Jacking and Lifting)

[Jacking](#) (Description and Operation),
[Lifting](#) (Description and Operation).

2. Explore the speed range of interest using the Road Test Quick Checks as previously described.

3. **3.** Carry out a coast down in neutral. If the vehicle is free of vibration when operating at a steady indicated speed and behaves very differently in drive and coast, a transmission concern is likely.

Note, however, that a test on the lift may produce different vibrations and noises than a road test because of the effect of the lift. It is not unusual to find vibrations on the lift that were not found in the road test. If the condition found on the road can be duplicated on the lift, carrying out experiments on the lift may save a great deal of time.

Exhaust Neutralization Procedure

1. **1.** Raise vehicle on lift and slacken all exhaust fixings.
2. **2.** With all fixings loose, neutralize the exhaust system.
3. **3.** Tighten all fixings to correct torque, starting at the rear-most point working towards the front of the vehicle.

Symptom Chart

Symptom	Possible Cause	Action
High-speed shake	<ul style="list-style-type: none"> ● Wheel end vibration ● Engine/transmission ● Driveline 	GO to Pinpoint Test A .
Tip-in moan	<ul style="list-style-type: none"> ● Air cleaner ● Power steering ● Powertrain ● Engine mounts ● Exhaust system 	GO to Pinpoint Test B .
Idle boom/shake/vibration, or shudder	<ul style="list-style-type: none"> ● Cable(s)/hoses(s) ● Intake air distribution and filtering system ● Engine mounts ● Exhaust system ● Belt/pulleys 	GO to Pinpoint Test C .
Wheel end vibration analysis	<ul style="list-style-type: none"> ● Suspension/rear drive halfshaft and CV joints ● Tires/wheels ● Wheel bearings ● CV joint boots 	GO to Pinpoint Test D .
Non-axle noise	<ul style="list-style-type: none"> ● Trim/mouldings ● A/C system ● Accessories 	GO to Pinpoint Test E .

Pinpoint Tests

• **NOTE:** These Pinpoint Tests are designed to take the technician through a step-by-step diagnosis procedure to determine the cause of a condition. It may not always be necessary to follow the chart to its conclusion. Carry out only the Pinpoint Test steps necessary to correct the condition. Then check operation of the system to make sure the condition is corrected.

After verifying that the condition has been corrected, make sure all components removed have been installed.

PINPOINT TEST A : HIGH-SPEED SHAKE	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: NEUTRAL COAST	
	1 Carry out the neutral coast test.
	Does the vibration disappear during the neutral coast test? Yes Check and install/re-balance wheels and tires and driveshaft. Check and install new engine/transmission mounts as necessary. Repeat Road Test as outlined. No GO to D1.

PINPOINT TEST B : TIP-IN MOAN	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: CHECK THE AIR CLEANER	
	1 Check the air cleaner. <ul style="list-style-type: none"> ● Check the air cleaner, inlet tube, outlet tube, resonators and all other components associated with the air induction system for correct installation and tightness of all connections.
	Are the components OK? Yes GO to B2. No Correct the condition. Repeat the Road Test as outlined.
B2: CHECK THE EXHAUST SYSTEM	
	1 Carry out the exhaust system neutralizing procedure in this section.

	Is the exhaust system OK? Yes GO to B3. No Repair as necessary. Restore vehicle. Repeat the Road Test as outlined.
--	--

B3: CHECK THE POWER STEERING

	1 Remove the auxiliary drive belt and test for tip-in moan.
--	--

	Is the tip-in moan OK? Yes Repair the power steering as necessary. For additional information, refer to Section 211-00. No Check and install new engine/transmission mounts as necessary. Repeat Road Test as outlined.
--	---

PINPOINT TEST C : IDLE BOOM/SHAKE/VIBRATION/SHUDDER

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

C1: CHECK CABLE/HOSES

	1 Check the engine compartment for any component that may be grounding between the engine and body or chassis. Example: air conditioning (A/C) hoses.
--	--

	Are the components OK? Yes GO to C2. No Correct the condition. Repeat the Road Test as outlined.
--	--

C2: CHECK THE COOLING RADIATOR

	1 Check the engine cooling radiator mountings and bushings for security and condition. Check the radiator installation for any component that may have a touch condition.
--	--

	Are the installation and bushings OK? Yes GO to C3. No Correct the condition. Repeat the Road Test as outlined.
--	---

C3: CHECK THE EXHAUST SYSTEM

	1 Carry out the exhaust system neutralizing procedure in this section.
--	---

	Is the exhaust system OK? Yes Check and install new engine/transmission mounts as necessary. Repeat Road Test as outlined. No Repair as necessary. Repeat Road Test.
--	--

PINPOINT TEST D : WHEEL END VIBRATION ANALYSIS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

D1: INSPECT THE TIRES

	1 Inspect the tires. <ul style="list-style-type: none"> ● Raise and support the vehicle. REFER to: (100-02 Jacking and Lifting) Jacking (Description and Operation), Lifting (Description and Operation). ● Inspect the tires for: ● Correct tire size ● Tire/wheel compatibility ● Wear or damage ● Tire beads correctly seated
--	---

	Are the tires OK? Yes GO to D2. No Inspect the wheels. For additional information, refer to Section 204-00.
--	---

D2: INSPECT WHEEL BEARINGS

	1 Inspect the wheel bearings. For additional information, refer to Section 204-00.
--	---

	Are the wheel bearings OK? Yes GO to D3. No Repair as necessary. Repeat the Road Test as outlined.
--	--

D3: INSPECT THE CONSTANT VELOCITY (CV) JOINT BOOTS

	1 Inspect the CV joint boots. <ul style="list-style-type: none"> ● Spin the rear tire by hand ● Inspect for evidence of cracks, tears, splits or splattered grease
--	---

	Are the CV joint boots OK? Yes GO to D4. No
--	--

	Repair as necessary. Repeat the Road Test as outlined.
D4: INSPECT WHEEL AND TIRE RUNOUT	
	<p>1 Inspect the wheel and tire runout.</p> <ul style="list-style-type: none"> Carry out the Wheel and Tire Check procedure. REFER to: Wheels and Tires (204-04 Wheels and Tires, Diagnosis and Testing).
	<p>Is the wheel and tire runout OK?</p> <p>Yes Balance the wheels and tires. Refer to the wheel balance equipment manufacturers instructions.</p> <p>No Repair as necessary. REFER to: Wheels and Tires (204-04 Wheels and Tires, Diagnosis and Testing). Repeat the Road Test as outlined.</p>

PINPOINT TEST E : NON-AXLE NOISE	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: INSPECT VEHICLE TRIM	
	<p>1 Check the grille and trim mouldings to see if they are the source of the noise.</p>
	<p>Are the vehicle trim components causing the noise?</p> <p>Yes Install new trim or repair as necessary. For additional information, refer to Section 501-08.</p> <p>No GO to E2.</p>
E2: CHECK THE A/C SYSTEM FOR NOISE	
	<p>1 Check the A/C system components for noise by turning the A/C system on and off.</p>
	<p>Is the A/C system causing the noise?</p> <p>Yes Diagnose the A/C system. REFER to: Climate Control System (412-00 Climate Control System - General Information, Diagnosis and Testing).</p> <p>No GO to E3.</p>
E3: CHECK NON-FACTORY ACCESSORIES	
	<p>1 Inspect any accessories for being the source of the noise. Example: grounding body-to-frame, antennas, visors, bug deflectors and fog lights?</p>
	<p>Are the accessories the cause of the noise?</p> <p>Yes Adjust, repair or install new accessories or fasteners as required.</p> <p>No Verify the customer concern.</p>

Noise, Vibration and Harshness - Exhaust System Neutralizing

General Procedures

1. Loosen the muffler inlet pipe and resonator pipe to exhaust manifold fasteners at the flanges and the muffler inlet connection.
2. Place a stand to support the muffler parallel to the vehicle frame with the muffler pipe bracket free of stress.
3. Tighten the muffler connection.
4. Position the exhaust pipes to the manifolds and tighten. Make sure that the catalytic converter and heat shield do not contact the frame rails.
5. With the complete exhaust system tight (and cooled) the rear hanger insulator should be angled forward, to allow the system to expand rearward when heated during normal running

Suspension System - General Information -

Vehicle Ride Height

Description		Measurement	
Description	Front/Rear	Kerb mm (inch)	Tolerance mm (inch)
Vehicles without supercharger	Front	387 (15.23)	±15 (0.6)
	Rear	392 (15.11)	±15 (0.6)
Vehicles with supercharger	Front	386 (15.19)	±15 (0.6)
	Rear	387 (15.23)	±15 (0.6)

- Ride height is measured from the centre of the wheel to the apex of the wheel arch, through the wheel centre line.
- Kerb - with all fluids at full and a full tank of fuel, no occupants/luggage.

Wheel Alignment - Front Camber

Description		Left-hand		Right-hand		Balance*1	
Markets	Degrees/Minutes	Nominal	Tolerance	Nominal	Tolerance	Nominal	Tolerance
All right-hand drive and Japan	Degrees/Minutes	-0° 36'	±45'	-0° 12'	±45'	-0° 24'	±45'
	Decimal Degrees	-0.6°	±0.75°	-0.2°	±0.75°	-0.4°	±0.75°

Suspension System - General Information - Suspension System

Diagnosis and Testing

Principle of Operation

For a detailed description of the suspension system, refer to the relevant Description and Operation section of the workshop manual. REFER to:

[Front Suspension](#) (204-01 Front Suspension, Description and Operation),
[Front Suspension](#) (204-01 Front Suspension, Description and Operation),
[Front Suspension](#) (204-01 Front Suspension, Description and Operation),
[Rear Suspension](#) (204-02 Rear Suspension, Description and Operation),
[Rear Suspension](#) (204-02 Rear Suspension, Description and Operation),
[Rear Suspension](#) (204-02 Rear Suspension, Description and Operation).

Inspection and Verification

1. Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are apparent, refer to section 100-04 Noise, Vibration and Harshness.
2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection Chart

Mechanical
<ul style="list-style-type: none"> ● Damaged tires ● Wheel bearing(s) ● Loose or damaged front or rear suspension components ● Loose, damaged or missing suspension fastener(s) ● Incorrect spring usage ● Damaged or sagging spring(s) ● Damaged or leaking shock absorber(s) ● Damaged or leaking strut(s) ● Worn or damaged suspension bushing(s) ● Loose, worn or damaged steering system components ● Damaged axle components

3. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the next step.
4. If the fault is not visually evident, verify the symptom and refer to the following Symptom Chart.

Symptom Chart

Symptom	Possible Sources	Action
Crabbing	* Incorrect rear thrust angle.	* Check the rear toe adjustment. REFER to: Rear Toe Adjustment (204-00 Suspension System - General Information, General Procedures).
	* Front or rear suspension components.	* Inspect the front and rear suspension systems. Repair or install new suspension components as necessary.
	* Drive axle damaged.	* Install a new rear drive axle/differential. REFER to: Axle Assembly - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Vehicles Without: Differential Drain Plug (205-02 Rear Drive Axle/Differential, Removal and Installation).
Drift/Pull	* Unequal tire pressure.	* Check and adjust the tire pressures. Inspect the tire for excessive wear. REFER to: Specifications (204-04 Wheels and Tires, Specifications).
	* Incorrect wheel alignment.	* Check and adjust the wheel alignment. REFER to: (204-00 Suspension System - General Information) Front Toe Adjustment (General Procedures), Rear Toe Adjustment (General Procedures), Camber and Caster Adjustment (General Procedures).
	* Tires.	* Check and adjust the tire pressures. Inspect the tire for excessive wear. REFER to: Specifications (204-04 Wheels and Tires, Specifications).
	* Unevenly loaded or overloaded vehicle.	* Notify the customer of incorrect vehicle loading.
	* Damaged steering components.	* Check the steering system.
	* Brake drag.	* Check the brakes. REFER to: Brake System (206-00 Brake System - General Information, Diagnosis and Testing).
Front Bottoming or Riding Low	* Coil springs.	* Check the ride height. Install new springs as necessary. REFER to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation), Shock Absorber and Spring Assembly (204-02 Rear Suspension, Removal and Installation).

Incorrect Tire Wear	* Incorrect tire pressure (rapid center rib or inner and outer edge wear).	* Check and adjust the tire pressure. Inspect the tire for excessive wear. REFER to: Specifications (204-04 Wheels and Tires, Specifications).
	* Excessive front or rear toe (rapid inner or outer edge wear).	* Check and adjust the wheel alignment. REFER to: (204-00 Suspension System - General Information) Front Toe Adjustment (General Procedures), Rear Toe Adjustment (General Procedures), Camber and Caster Adjustment (General Procedures).
	* Excessive negative or positive camber (rapid inner or outer edge wear).	* Check and adjust the wheel alignment. REFER to: (204-00 Suspension System - General Information) Front Toe Adjustment (General Procedures), Rear Toe Adjustment (General Procedures), Camber and Caster Adjustment (General Procedures).
	* Tires out of balance (tires cupped or dished).	* Balance the tires.
Rough ride	* Spring(s)	* Check and install new spring(s) as necessary. REFER to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation), Shock Absorber and Spring Assembly (204-02 Rear Suspension, Removal and Installation).
Shimmy or Wheel Tramp	* Loose wheel nut(s).	* Check and tighten the wheel nuts to specification. REFER to: Specifications (204-04 Wheels and Tires, Specifications).
	* Loose front suspension fasteners.	* Check and tighten the suspension fasteners to specification. REFER to: Specifications (204-00 Suspension System - General Information, Specifications).
	* Front wheel bearing(s).	* Check the wheel bearings.
	* Worn or damaged suspension component bushing.	* Check and install new components as necessary.
	* Wheel/tires.	* Check the wheels/tires. Balance or install new wheel/tires as necessary. REFER to: Wheels and Tires (204-04 Wheels and Tires, Diagnosis and Testing).
	* Loose, worn or damaged ball joint(s).	* Check the Ball Joint(s).
	* Loose, worn or damaged steering components.	* Check and install new components as necessary.
	* Front wheel alignment.	* Check and adjust the wheel alignment. REFER to: (204-00 Suspension System - General Information) Front Toe Adjustment (General Procedures), Rear Toe Adjustment (General Procedures), Camber and Caster Adjustment (General Procedures).
	* Shock absorber(s).	* Check and install new shock absorber(s) as necessary. REFER to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation), Shock Absorber and Spring Assembly (204-02 Rear Suspension, Removal and Installation).
	* Spring(s).	* Check and install new springs as necessary. REFER to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation), Shock Absorber and Spring Assembly (204-02 Rear Suspension, Removal and Installation).
Poor self center action of the steering	* Ball joints.	* Check the Ball Joints.
	* Steering components.	* Check and install new components as necessary.
Steering wheel off-center	* Unequal front or rear toe settings.	* Check and adjust the wheel alignment. REFER to: (204-00 Suspension System - General Information) Front Toe Adjustment (General Procedures), Rear Toe Adjustment (General Procedures), Camber and Caster Adjustment (General Procedures).
	* Steering components.	* Check and install new components as necessary.
Sway or roll	* Overloaded, unevenly or incorrectly loaded vehicle.	* Notify the customer of incorrect vehicle loading.
	* Loose wheel nut(s).	* Check and tighten the wheel nut(s) to specification. REFER to: Specifications (204-04 Wheels and Tires, Specifications).
	* Coil spring(s).	* Check and install new coil springs as necessary. REFER to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation), Shock Absorber and Spring Assembly (204-02 Rear Suspension, Removal and Installation).
	* Loose front stabilizer bar or rear stabilizer bar.	* Check and tighten the stabilizer bar to specification. REFER to: Specifications (204-01 Front Suspension, Specifications), Specifications (204-02 Rear Suspension, Specifications).
	* Worn lower suspension arm stabilizer bar insulators.	* Install new lower suspension arm stabilizer bar as necessary. REFER to: Front Stabilizer Bar - 2.7L Diesel (204-01, Removal and Installation), Front Stabilizer Bar - 3.0L (204-01, Removal and Installation), Front Stabilizer Bar - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 (204-01 Front Suspension, Removal and Installation), Rear Stabilizer Bar (204-02 Rear Suspension, Removal and Installation).

	* Shock absorber(s).	* Check and install new shock absorber(s) as necessary. REFER to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation), Shock Absorber and Spring Assembly (204-02 Rear Suspension, Removal and Installation).
Vehicle Leans to One Side	* Unevenly loaded or overloaded vehicle.	* Notify the customer of incorrect vehicle loading.
	* Front or rear suspension components.	* Inspect the front and rear suspension systems. Repair or install new suspension components as necessary.
	* Shock absorber(s).	* Check and install new shock absorber(s) as necessary. REFER to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation), Shock Absorber and Spring Assembly (204-02 Rear Suspension, Removal and Installation).
	* Coil spring(s).	* Check and install new spring(s) as necessary. REFER to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation), Shock Absorber and Spring Assembly (204-02 Rear Suspension, Removal and Installation).
	* Incorrect ride height. Lateral tilt out of specification.	* Check the ride height. Install new spring(s) as necessary. REFER to: Front Shock Absorber (204-01 Front Suspension, Removal and Installation), Shock Absorber and Spring Assembly (204-02 Rear Suspension, Removal and Installation).
Vibration/Noise	* Tires/wheels. * Wheel bearings. * Wheel hubs. * Brake components. * Suspension components. * Steering components.	* Check and install new components as necessary.
Wander	* Unevenly loaded or overloaded vehicle.	* Notify the customer of incorrect vehicle loading.
	* Ball joint(s).	* Check the Ball Joint(s).
	* Front wheel bearing(s).	* Check the wheel bearings.
	* Loose, worn or damaged suspension components.	* Check and install new suspension components as necessary.
	* Loose suspension fasteners.	* Check and tighten the suspension fasteners to specification. REFER to: Specifications (204-00 Suspension System - General Information, Specifications).

Component Tests

Ball Joint Inspection

• NOTE: The front suspension is shown in the following procedures. The inspection of the rear suspension upper ball joint is similar.

1. Raise and support the vehicle. REFER to: (100-02 Jacking and Lifting)

[Jacking](#) (Description and Operation),
[Lifting](#) (Description and Operation).

2. Prior to carrying out any inspection of the ball joints, inspect the front wheel bearings.

3.  CAUTION: The safety stand beneath the suspension lower arm must only support the weight of the suspension and not the full weight of the vehicle. Failure to follow this instruction may result in damage to the components.

3. Position a safety stand beneath the front suspension lower arm or rear suspension lower arm to be tested.

VJJ0005101

4. **4.** While an assistant pulls and pushes the top and bottom of the tire, observe the relative movement between the ball joint and the front suspension lower arm. Any movement at or exceeding the specification indicates a worn or damaged ball joint. Install a new wheel knuckle as necessary. REFER to: [Wheel Knuckle](#) (204-01 Front Suspension, Removal and Installation).

VJJ0005100

5. **5.** While an assistant pulls and pushes the top and bottom of the tire, observe the relative movement between the ball joint and the front suspension upper arm or rear suspension upper arm. Any movement at or exceeding the specification indicates a worn or damaged ball joint. Install a new upper arm as necessary. REFER to: (204-01 Front Suspension)

[Upper Arm LH](#) (Removal and Installation),
[Upper Arm RH](#) (Removal and Installation).

6. **6.** Remove the safety stand.

7. **7.** Lower the vehicle.

Suspension System - General Information - Camber and Caster Adjustment

General Procedures

- NOTE: The camber and caster adjustment for the left-hand side is shown, the procedure for adjusting the right-hand side is similar.
- NOTE: This procedure must be carried out using a 4-post ramp.
- NOTE: Adjustments to the camber will affect the toe settings. Therefore, the camber and toe may need to be adjusted at the same time to achieve the correct settings.
- NOTE: Adjustments to the camber may affect the caster settings. Therefore, the caster will need to be checked, and adjusted as necessary.

All vehicles

1. Check the rear toe adjustment.
For additional information, refer to: [Rear Toe Adjustment](#) (204-00 Suspension System - General Information, General Procedures).
Adjust as necessary.
2. Check the front toe adjustment.
For additional information, refer to: [Front Toe Adjustment](#) (204-00 Suspension System - General Information, General Procedures).
Adjust as necessary.
3. Check the camber and caster settings. Follow the equipment manufacturer's instructions.
4. NOTE: Left-hand shown, right-hand similar.

Loosen the tie-rod end lock nut.

- Clean and lubricate the lock nut and tie-rod threads.

E31080

5. NOTE: Do not allow the tie-rod end or steering gear boot to twist when the tie-rod is rotated.

- NOTE: Left-hand, shown right-hand similar.

Rotate the tie-rod to adjust the toe.

VUJ0005108

Vehicles requiring camber adjustment

VUJ0005104

6. NOTE: Left-hand shown, right-hand similar.

Loosen the rear lower arm lock nut.

VUJ0005105

7. NOTE: Left-hand shown, right-hand similar.

Rotate the camber adjustment cam bolt to adjust the camber.

8. Check the camber and toe settings. Follow the equipment manufacturer's instructions. Adjust as necessary.

9. NOTE: Make sure the camber adjustment cam bolt does not rotate.

• NOTE: Left-hand shown, right-hand similar.

Tighten the rear lower arm lock nut.

- Tighten to 175 Nm.

VUJ0005104

Vehicles requiring caster adjustment

10. NOTE: Left-hand shown, right-hand similar.

Loosen the front lower arm lock nut.

VUJ0005102

11. NOTE: Adjustments to the caster will affect the toe settings. Therefore, the caster and toe may need to be adjusted at the same time to achieve the correct settings.

- NOTE: Left-hand shown, right-hand similar.

Rotate the caster adjustment cam bolt to adjust the caster.

12. NOTE: Make sure the caster adjustment cam bolt does not rotate.

- NOTE: Left-hand shown, right-hand similar.

Tighten the caster adjustment cam bolt lock nut.

- Tighten to 175 Nm.

13. NOTE: Make sure the tie-rod or tie-rod end does not rotate.

- NOTE: Left-hand shown, right-hand similar.

Tighten the tie-rod end lock nut

- Tighten to 55 Nm.

14. NOTE: Make sure that all fixings are torqued to the correct specification.

Check the caster and toe settings. Follow the equipment manufacturer's instructions. Adjust as necessary.

Suspension System - General Information - Four-Wheel Alignment

General Procedures

• CAUTIONS:

Make sure the vehicle is on a flat level surface.

Make sure the tire pressures are within specification.

Make sure that only the manufacturers' recommended four wheel alignment equipment is used.

Make sure the steering is in the straight ahead position.

1. For wheel alignment information, refer to the suspension specification section.
For additional information, refer to: [Specifications](#) (204-00 Suspension System - General Information, Specifications).
2. Check the tie rod ends, suspension joints, wheel bearings and wheels and tires for damage, wear and free play.
 - Adjust or repair any worn, damaged or incorrectly adjusted components.
3. Check and adjust tire pressures.
4. Position the vehicle on a calibrated, level, vehicle lift.
5. Release the vehicle parking brake.
6. Using only four-wheel alignment equipment approved by Jaguar, check the wheel alignment.
7. **NOTE:** LH illustration shown, RH is similar.

To adjust, loosen the toe link locknuts.

E31614

E31613

8. **CAUTION:** Do not allow the gaiter to twist.
 - **NOTE:** Both tie rods must be rotated by an equal amount.
 - **NOTE:** LH illustration shown, RH is similar.

Adjust the rear toe.

9. Tighten the toe link locknuts to 55 Nm (40 lb.ft).

E31607

10. NOTE: LH illustration shown, RH is similar.

To adjust the caster, loosen the front lower arm lock nuts.

E31608

11. NOTE: LH illustration shown, RH is similar.

Rotate the caster adjustment cam bolt.

12.  CAUTION: Make sure the caster adjustment bolt does not rotate while the lock nut is being tightened.

Tighten the caster adjustment cam bolt nut.

- Tighten the nut and bolt to 175 Nm (129 lb.ft).

E31607

13.  CAUTION: Adjustments made to the camber setting will affect the front toe setting. Therefore, the camber and toe may need to be adjusted at the same time.

• NOTE: LH illustration shown, RH is similar.

To adjust the camber, loosen the rear lower arm lock nuts.

E31609

14. NOTE: LH illustration shown, RH is similar.

Rotate the camber adjustment cam bolt.

15.  CAUTION: Make sure the camber adjustment bolt does

not rotate while the lock nut is being tightened.

Tighten the camber adjustment cam bolt nut.

- Tighten the nut and bolt to 175 Nm (129 lb.ft).

16. NOTE: LH illustration shown, RH is similar.

To adjust, loosen the tie rod end lock nuts.

E31612

17. ⚠ CAUTION: Do not allow the gaiter to twist.

- NOTE: Both tie rods must be rotated by an equal amount.
- NOTE: LH illustration shown, RH is similar.

Adjust the front toe.

E31611

18. Tighten the tie rod end lock nuts to 55 Nm (40 lb.ft).

19. Using only four-wheel alignment equipment approved by Jaguar, check the wheel alignment.

Suspension System - General Information - Front Toe Adjustment

General Procedures

• CAUTIONS:

Make sure the vehicle is on a flat level surface.

Make sure the tire pressures are within specification.

Make sure that only the manufacturers' recommended four wheel alignment equipment is used.

Make sure the steering is in the straight ahead position.

1. For wheel alignment information, refer to the suspension specification section.
For additional information, refer to: [Specifications](#) (204-00 Suspension System - General Information, Specifications).
2. Check the tie rod ends, suspension joints, wheel bearings and wheels and tires for damage, wear and free play.
 - Adjust or repair any worn, damaged or incorrectly adjusted components.
3. Check and adjust tire pressures.
4. Position the vehicle on a 4 post lift.
5. Release the vehicle parking brake.
6. Using only four-wheel alignment equipment approved by Jaguar, check the wheel alignment.
7. **NOTE:** LH illustration shown, RH is similar.

To adjust, loosen the tie rod end lock nuts.

8. **CAUTION:** Do not allow the gaiter to twist.
- **NOTE:** Both tie rods must be rotated by an equal amount.
- **NOTE:** LH illustration shown, RH is similar.

Adjust the front toe.

9. NOTE: LH illustration shown, RH is similar.

Tighten the tie rod end lock nuts to 55 Nm.

10. Using only four-wheel alignment equipment approved by Jaguar, check the wheel alignment.

Suspension System - General Information - Rear Toe Adjustment

General Procedures

1. Check the toe settings. Follow the equipment manufacturer's instructions.

2. **NOTE:** Left-hand, shown right-hand similar.

Loosen the lock nut.

- Clean and lubricate the lock nut and toe link threads.

3. Rotate the toe link to adjust the toe settings.

4. Tighten the lock nut.

5. Check the toe settings. Follow the equipment manufacturer's instructions.

Front Suspension - Front Suspension - Overview

Description and Operation

OVERVIEW

The front suspension is a fully independent design assembled on a non-isolated subframe. The wheel knuckle attaches to the wishbone type upper and lower control arms.

The stabilizer bar attaches to the front of the subframe and varies in shape depending on the engine variant.

The spring and damper assemblies are located between the lower control arm and the front suspension housing in the inner wing. Dependant on vehicle model there are three types of coil spring and damper available:

- a standard oil passive damper (All models except supercharged),
- an adaptive damper, also known as Computer Active Technology Suspension (CATS) on 4.2L supercharged vehicles up to 2010MY,
Refer to: [Vehicle Dynamic Suspension - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (204-05 Vehicle Dynamic Suspension, Description and Operation).
- a continuously variable adaptive damper, also known as Adaptive Dynamics System on 5.0L supercharged vehicles from 2010MY.
Refer to: [Vehicle Dynamic Suspension - 5.0L](#) (204-05 Vehicle Dynamic Suspension, Description and Operation).

Front Suspension - Front Suspension - System Operation and Component Description

Description and Operation

System Operation

The front suspension is a fully independent design assembled on a non-isolated subframe mounted by four bolts to the vehicle body. This rigid mounting arrangement provides the driver with optimum steering feel and facilitates towards the vehicle's sporty dynamic suspension.

The suspension arrangement is a double-wishbone type with the length ratio between the upper and lower wish-bone control arms calculated to minimize track and camber changes.

An adaptive damping system is available on specified models. For additional information refer to Vehicle Dynamic Suspension 4.2L or 5.0L.

Component Description

COMPONENTS

ItemDescription

1	Subframe
2	Spring and damper assembly
3	Upper control arm
4	Wheel knuckle
5	Stabilizer bar link
6	Wheel hub and bearing assembly
7	Lower lateral control arm
8	Lower forward control arm
9	Stabilizer bar

Upper Control Arm

The forged-aluminum upper control arm is a wishbone design and connects to the vehicle body through two plain bushes, and links to the swan neck wheel knuckle by an integral ball joint. The upper control arm is inclined to provide anti-dive characteristics under heavy braking, while also controlling geometry for vehicle straight-line stability.

Lower Control Arm

The forged aluminum lower control arms are of the wishbone design; the arms separate to allow for optimum bush tuning:

- The rear lateral control arm is fitted with a bush at its inner end which locates between brackets on the subframe. The arm is secured with an eccentric bolt which provides the adjustment of the suspension camber geometry. The outer end of the control arm has a tapered hole which locates on a ball joint fitted to the wheel knuckle. An integral clevis bracket on the forward face of the lateral control arm allows for the attachment of the forward control arm. A bush is fitted below the clevis bracket to provide for the attachment of the stabilizer bar link. A cross-axis joint is fitted to a cross-hole in the control arm to provide the location for the clevis attachment of the spring and damper assembly.
- The forward control arm is fitted with a fluid-block rubber bush at its inner end which locates between brackets on the subframe. The arm is secured with an eccentric bolt which provides adjustment of the castor and camber geometry. The outer end of the control arm is fitted with a cross-axis joint and locates in the integral clevis bracket on the lateral control arm.

Wheel Knuckle

The cast aluminum wheel knuckle is a swan neck design and attaches to the upper control arm and lower lateral control arm. The lower lateral control arm locates on a non serviceable ball-joint integral with the wheel knuckle. The lower boss on the rear of the knuckle provides for the attachment of the steering gear tie-rod ball joint.

The wheel knuckle also provides the mounting locations for the:

- wheel hub and bearing assembly
- the wheel speed sensor (integral to the wheel hub and bearing assembly)
- brake caliper and disc shield.

Stabilizer Bar

The stabilizer bar is attached to the front of the subframe with bushes and mounting brackets. The pressed steel mounting brackets locate over the bushes and are attached to the cross member with bolts screwed into threaded locations in the subframe. The stabilizer bar has crimped, 'anti-shuffle' collars pressed in position on the inside edges of the bushes. The collars prevent sideways movement of the stabilizer bar.

The stabilizer bar is manufactured from 32mm diameter tubular steel on supercharged models and 31mm diameter tubular steel on diesel and normally aspirated models and has been designed to provide particular characteristics in maintaining roll rates, specifically in primary ride comfort.

Each end of the stabilizer bar curves rearwards to attach to a ball joint on a stabilizer link. Each stabilizer link is secured to a bush in the lower lateral arm with a bolt and locknut. The links allow the stabilizer bar to move with the wheel travel providing maximum effectiveness.

The only difference between the front stabilizer bars, in addition to the diameter, is in the shape to accommodate engine variant:

- a slightly curved bar, between bush centers, for V6 diesel (31 mm dia) and V8 gasoline supercharged (32 mm dia),
- a straight bar, between bush centers, for V6 and V8 normally aspirated gasoline engines (31 mm dia).

Spring and Damper Assembly

The spring and damper assemblies are located between the lower lateral arm and the front suspension housing in the inner wing. Dependant on vehicle model there are three types of coil spring and damper available:

- a standard oil passive damper (All models except supercharged),
- an adaptive damper, also known as Computer Active Technology Suspension (CATS) on 4.2L supercharged vehicles up to 2010MY, For additional information refer to Vehicle Dynamic Suspension 4.2L.
- a continuously variable adaptive damper, also known as Adaptive Dynamics System on 5.0L supercharged vehicles from 2010MY. For additional information refer to Vehicle Dynamic Suspension 5.0L.

The dampers are a monotube design with a spring seat secured by a circlip onto the damper tube. The damper's lower spherical joint is an integral part of the lateral lower control-arm, and the damper takes the form of a clevis-end, which straddles the spherical joint.

The damper piston is connected to a damper rod which is sealed at its exit point from the damper body. The threaded outer end of the damper rod locates through a hole in the top mount. A self locking nut secures the top mount to the damper rod. The damper rod on the adaptive damper has an electrical connector on the outer end of the damper rod.

Supercharged 4.2L vehicles up to 2010MY: The adaptive damper functions by restricting the flow of hydraulic fluid through internal galleries in the damper's piston. The adaptive damper has a solenoid operated valve, which when switched allows a greater flow of hydraulic fluid through the damper's piston. This provides a softer damping characteristic from the damper. The adaptive damper defaults to a firmer setting when not activated. The solenoid is computer controlled and can switch between soft and hard damping settings depending on road wheel inputs and vehicle speed.

Supercharged 5.0L vehicles from 2010MY: The variable damper functions by adjustment of a solenoid operated variable orifice, which opens up an alternative path for oil flow within the damper. When de-energized the bypass is closed and all the oil flows through the main (firm) piston. When energized the solenoid moves an armature and control blade, which work against a spring. The control blade incorporates an orifice which slides inside a sintered housing to open up the bypass as required. In compression, oil flows from the lower portion of the damper through a hollow piston rod, a separate soft (comfort) valve, the slider housing and orifice and into the upper portion of the damper, thereby bypassing the main (firm) valve. In rebound the oil flows in the opposite direction

The damper rod is fitted with a spring aid which prevents the top mount making contact with the top of the damper body during full suspension compression and also assists with the suspension tune.

The spring rate of the coil springs can differ between models and are color coded for identification. The coil spring locates on a spring packer and a lower spring seat which is located on the damper body. The spring locates in an upper spring seat which is located on the underside of the top mount. The majority of the roll stiffness is provided by the springs rather than the stabilizer bar as this arrangement allows for a natural frequency of roll and consequently a consistent suspension ride.

Front Suspension - Front Suspension

Diagnosis and Testing

For Diagnosis and Testing information.

REFER to: [Suspension System](#) (204-00 Suspension System - General Information, Diagnosis and Testing).

Front Suspension - Front Shock Absorber

Removal and Installation

Removal

- NOTE: Fuse box release only required on removal of the RH front shock absorber.
- NOTE: Expansion tank release only required for supercharged variant removal of the LH front shock absorber.

All vehicles

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the front wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
3. Remove the front stabilizer bar link.
For additional information, refer to: [Front Stabilizer Bar Link](#) (204-01 Front Suspension, Removal and Installation).
4. Release the front shock absorber from the lower arm.

5. CAUTIONS:

 Make sure the wheel knuckle is supported. Failure to follow these instructions may result in damage to the vehicle.

 Use an Allen key to prevent the ball joint rotating whilst removing the nut.

Disconnect the upper arm from the wheel knuckle.

6. Lower the vehicle.

7. Release the fuse box.

- Remove the 2 bolts and 1 nut.
- Position the fuse box aside for access to the inboard retaining nut.

Vehicles with supercharger

8. Release the coolant expansion tank for access.

All vehicles

9. Disconnect the front shock absorber electrical connector.

10. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the front shock absorber and spring assembly.

11. NOTE: Do not disassemble further if the component is removed for access only.

Install the front shock absorber and spring assembly in the spring compressor.

12. ⚠ WARNING: The spring is under extreme tension, care must be taken at all times. Failure to follow these instruction may result in personal injury.

Compress the spring.

E31041

13. Remove the front shock absorber retaining nut

14. Carefully release the spring tension.

E31039

15. Remove the front shock absorber.

E31042

Installation

All vehicles

1. Vehicles without adaptive damping: Tighten the nut to 50 Nm.

E31040

2. Vehicles with adaptive damping: Tighten the nut to 27 Nm.

E31040

3. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Install the front shock absorber and spring assembly.

- Tighten the nuts to 27 Nm.

VUJ0005259

4. Connect the front shock absorber electrical connector.

5. Secure the fuse box.

Vehicles with supercharger

6. Secure the coolant expansion tank.

- Tighten to 10 Nm.

All vehicles

7. Raise the vehicle.

8. CAUTIONS:

 Use an Allen key to prevent the ball joint rotating whilst installing the nut.

 Make sure the wheel knuckle is supported. Failure to follow these instructions may result in damage to the vehicle.

Secure the upper arm to the wheel knuckle.

- Tighten the nut to 90 Nm.

9. Connect the front shock absorber and spring assembly to the lower arm.

- Tighten the bolt to 175 Nm.

10. Install the front stabilizer bar link.

For additional information, refer to: [Front Stabilizer Bar Link](#) (204-01 Front Suspension, Removal and Installation).

11. Install the front wheel and tire.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

12. Lower the vehicle.

Front Suspension - Front Lower Arm

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).
3. Remove the front wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
4. **NOTE:** Note the fitted position.

• **NOTE:** RH illustration shown, LH is similar

Release the front lower arm.

- Remove the 2 bolts and discard the nuts.

E64423

Installation

1. **NOTE:** RH illustration shown, LH is similar

Install the front lower arm.

- Install the bolt and tighten the new nut to 60 Nm + 135 degrees.
- Install the front lower arm inner retaining nut and bolt, but do not fully tighten at this stage.

E64423

2. Install the front wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
3. Lower the vehicle.

4.  **CAUTION:** The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels

Tighten the 14mm bolt to 175 Nm.

E31019

- 5.** Install the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).
- 6.** Lower the vehicle.
- 7.** Using only four-wheel alignment equipment approved by Jaguar, check the wheel alignment, and adjust if required.

Front Suspension - Rear Lower Arm

Removal and Installation

Special Tool(s)	
 <p>204-327</p> <p>E63732</p>	Ball joint splitter 204-327

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise the vehicle on a 4 post lift.

- Remove the engine undertray.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the body.

- Remove the wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
- Remove the stabilizer bar link.
For additional information, refer to: [Front Stabilizer Bar Link](#) (204-01 Front Suspension, Removal and Installation).
- Release the tie rod.

- Release the steering gear.

8. Secure the steering gear.

VUJ0005121

9. Release the shock absorber and spring assembly.

VUJ0005255

10. Remove the rear lower arm inner bolt.

VUJ0005104

11. Release the front lower arm.

- Remove and discard the nut and bolt.

E31020

E31025

12.  CAUTION: Prevent the rear lower arm ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the lower ball joint boot.

Loosen the rear lower arm ball joint retaining nut.

E76001

13.  CAUTION: Prevent the rear lower arm ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the lower ball joint boot.

Adjust the rear lower arm ball joint retaining nut until the ball joint thread cannot be seen.

E76003

14.  WARNING: Make sure the special tool is supported while carrying out the operation. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 Make sure the special tool is supported while carrying out the operation. Failure to follow this instruction may result in damage to the special tool.

 Make sure the special tool is correctly located and the lower ball joint boot is not damaged while carrying out the operation. Failure to follow this instruction may result in damage to the component.

Using the special tool, release the rear lower arm ball joint from the wheel knuckle lower pivot.

- Tighten the special tool adjusting bolt to a maximum of 60 Nm.
- If the rear lower arm ball joint releases from the wheel knuckle lower pivot, using no more than 60 Nm on the special tool adjusting bolt, proceed to step 13.
- If the rear lower arm ball joint does not release from the wheel knuckle lower pivot, using no more than 60 Nm on the special tool adjusting bolt, proceed to step 12.

E76003

15. **WARNING:** Make sure the special tool is supported while carrying out the operation. Failure to follow this instruction may result in personal injury.

• **CAUTIONS:**

Make sure the special tool is supported while carrying out the operation. Failure to follow this instruction may result in damage to the special tool.

Make sure the special tool is correctly located and the lower ball joint boot is not damaged while carrying out the operation. Failure to follow this instruction may result in damage to the component.

• **NOTE:** Do not carry out this step if the rear lower arm ball joint released from the wheel knuckle lower pivot in step 12.

Using the special tool, release the rear lower arm ball joint from the wheel knuckle lower pivot.

- Tighten the special tool adjusting bolt to a maximum of 60 Nm.
- Strike the top surface of the special tool directly above the rear lower arm ball joint at the point indicated using a copper mallet.

E76004

16. **CAUTION:** Prevent the rear lower arm ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the lower ball joint boot.

Remove the rear lower arm.

- Remove and discard the retaining nut.

Installation

E31025

1. **WARNING:** Make sure that a new lower arm ball joint nut is installed.

CAUTION: Prevent the rear lower arm ball joint ball pin hexagon from rotating. Failure to follow this instruction may result in damage to the lower ball joint boot.

Install the rear lower arm.

- Tighten the nut to 92 Nm.

2. NOTE: Install a new retaining nut and bolt.

Secure the front lower arm.

- Stage 1: Tighten to 60 Nm.
- Stage 2: Tighten to a further 135 degrees.

E31020

3. Secure the rear lower arm.

- Install the rear lower arm inner retaining nut, but do not tighten fully at this stage.

VUJ0005104

4. Install the shock absorber and spring assembly.

- Tighten the bolt to 175 Nm.

VUJ0005255

5. Remove and discard the retaining straps.

VUJ0005121

VUJ0005142

6. Install the steering gear.

- Tighten the bolts to 100 Nm.

7. Secure the tie rod end.

- Tighten the nut to 55 Nm.

8. Install the stabilizer bar link.

For additional information, refer to: [Front Stabilizer Bar Link](#) (204-01 Front Suspension, Removal and Installation).

9. Install the wheel and tire.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

10. Lower the body.

11.  **CAUTION:** The final tightening of the upper arm must be carried out with the vehicle on it's wheels.

Tighten to 175 Nm.

VUJ0005104

12. Install the engine undertray.

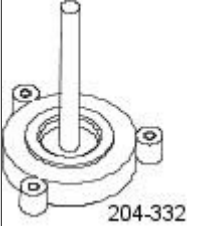

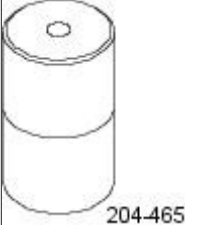

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

13. Using only four-wheel alignment equipment approved by Jaguar, check and adjust the wheel alignment.

For additional information, refer to: [Camber and Caster Adjustment](#) (204-00 Suspension System - General Information, General Procedures).

Front Suspension - Rear Lower Arm Bushing

Removal and Installation

Special Tool(s)	
	Rear lower arm bushing remover and installer 204-464
	Rear lower arm bushing remover 204-333
	Rear lower arm bushing installer 204-332
	Rear lower arm bushing installer 204-465
	Rear lower arm bushing installer 204-334

Removal

CAUTION: Nuts and bolts must be tightened with the weight of the vehicle on the suspension.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the rear lower arm.

For additional information, refer to: [Rear Lower Arm](#) (204-01 Front Suspension, Removal and Installation).

E30798

3. NOTE: Note the fitted position.

Using the special tools, remove and discard the lower arm rear bushings.

Installation

E30799

1. Install the special tools to the rear lower arm.

- Tighten the bolts.

E 30800

2. NOTE: Align to the position noted on removal.

Position the bushing in the special tool.

E30801

3. Using the special tools, partially install the lower arm bushing.

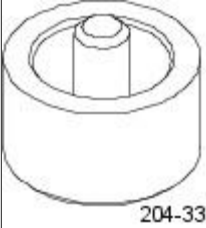

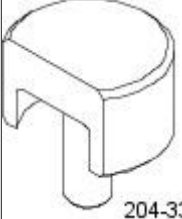

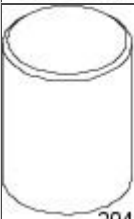

E30802

4. Change the special tools, then complete installation of the bushing.

5. Install the rear lower arm.
For additional information, refer to: [Rear Lower Arm](#) (204-01 Front Suspension, Removal and Installation).

Front Suspension - Shock Absorber Bushing

Removal and Installation

Special Tool(s)	
	Replacer support-bush 204-337
	Replacer-bush 204-338
	Remover-bush 204-336
	Remover support-bush 204-335

Removal

CAUTION: Nuts and bolts must be tightened with the weight of the vehicle on the suspension.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise the vehicle on a 4 post lift.

- Remove the rear lower arm.
For additional information, refer to: [Rear Lower Arm](#) (204-01 Front Suspension, Removal and Installation).

- NOTE:** Take note of the fitted position of the bush.

Using the special tools, remove the shock absorber bushing.

E30779

Installation

1. NOTE: Make sure the shock absorber bushing boot is correctly located into the special tool.

Install the bushing into the special tool.

E30781

2. NOTE: Align to the position noted on removal.

Using the special tools, install the shock absorber bushing.

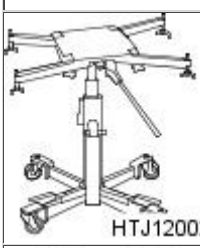

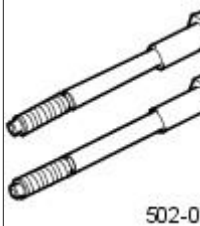

E30782

3. Install the rear lower arm.

For additional information, refer to: [Rear Lower Arm](#) (204-01 Front Suspension, Removal and Installation).

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Battery Disconnect and Connect (414-01, General Procedures).
2. Using suitable [tie straps](#), secure the radiator.

3. Remove the intake air shutoff throttle.
For additional information, refer to: Intake Air Shutoff Throttle (303-04A, Removal and Installation).

4.  **CAUTION:** Protect the paintwork during this operation.

Install the special tool.

5. Install the special tool.

6.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

7. Remove both the front wheel and tires.

For additional information, refer to: Wheel and Tire (204-04, Removal and Installation).

8. Remove the air deflector.

For additional information, refer to: Air Deflector (501-02, Removal and Installation).

9. Remove the radiator splash shield.

For additional information, refer to: Radiator Splash Shield (501-02, Removal and Installation).

10. Detach the transmission fluid cooler.

- Tie aside.

11. Remove the right-hand splash shield.

12. Detach the engine coolant inlet pipe from the front subframe.

13. Detach the power steering hose retaining clip from the front subframe.

E52478

14. NOTE: Left-hand shown, right-hand similar.

Remove the front stabilizer bar link upper retaining nut.

VUJ0005261

15. NOTE: Left-hand shown, right-hand similar.

Remove the front stabilizer bar link lower retaining bolt and nut and remove the front stabilizer bar link.

VUJ0005262

16. Detach the steering gear.

- Secure the steering gear.

VUJ0005142

17. NOTE: Left-hand shown, right-hand similar.

Release the front lower arm and position it to one side.

VUJ0005102

18. NOTE: Left-hand shown, right-hand similar.

Release the rear lower arm and position it to one side.

VUJ0005104

19. NOTE: Left-hand shown, right-hand similar.

Remove the engine mount retaining nut.

VUJ0005532

20. Install the special tool to the front subframe.

E31131

21. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe front retaining bolt.

E31132

22. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe rear retaining bolt.

E31275

23.  CAUTION: When lowering the special tool care must be taken to manoeuvre the special tool so that the front subframe does not touch the air conditioning (A/C) pipes. Failure to follow this instruction may result in damage to the A/C pipes.

Lower the special tool by approximately 200 mm (7.9 in).

24. NOTE: Left-hand shown, right-hand similar.

Remove the front stabilizer bar clamp.

25. Remove the front stabilizer bar.

Installation

1. Install the front stabilizer bar.

2. NOTE: Left-hand shown, right-hand similar.

Install the front stabilizer bar clamp.

- Tighten to 55 Nm.

3.  CAUTION: When raising the special tool care must be taken to manoeuvre the special tool so that the front subframe does not touch the air conditioning (A/C) pipes. Failure to follow this instruction may result in damage to the A/C pipes.

Install the front subframe.

4. NOTE: Left-hand shown, right-hand similar.

Install the special tool.

5. NOTE: Left-hand shown, right-hand similar.

Install the front subframe rear retaining bolt.

- Tighten to 150 Nm + 240°.

6. Remove the special tool.

7. Install the front subframe front retaining bolt.

- Tighten to 150 Nm + 240°.

8. Remove the special tool.

9. Install the front subframe front retaining bolt.

- Tighten to 150 Nm + 240°.

10. Remove the special tool.

11. NOTE: Left-hand shown, right-hand similar.

Install the engine mount retaining nut.

- Tighten to 63 Nm.

12.  CAUTION: The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Install the rear lower arm.

13.  CAUTION: The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Install the front lower arm.

14. NOTE: Left-hand shown, right-hand similar.

Install the steering gear.

- Tighten to 100 Nm.

15. NOTE: Left-hand shown, right-hand similar.

Install the front stabilizer bar link.

16. NOTE: Left-hand shown, right-hand similar.

Attach the front stabilizer bar link and install the front stabilizer bar link retaining nut.

- Tighten to 43 Nm.

17. Attach the power steering hose retaining clip to the front subframe.

18. Attach the engine coolant inlet pipe to the front subframe.

19. Install the right-hand splash shield.

20. Attach the transmission fluid cooler.

21. Install the radiator splash shield.

For additional information, refer to: Radiator Splash Shield (501-02, Removal and Installation).

22. Install the air deflector.

For additional information, refer to: Air Deflector (501-02, Removal and Installation).

23. Install both the front wheel and tires.

For additional information, refer to: Wheel and Tire (204-04, Removal and Installation).

24. Lower the vehicle.

25.  CAUTION: The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Tighten to 175 Nm.

VUJ0005104

26.  CAUTION: The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Tighten to 175 Nm.

27. NOTE: Left-hand shown, right-hand similar.

Tighten to 70 Nm.

28.  CAUTION: Protect the paintwork during this operation.

Remove the special tool.

29. Remove the special tool.

30. Install the intake air shutoff throttle.
For additional information, refer to: Intake Air Shutoff Throttle (303-04A, Removal and Installation).

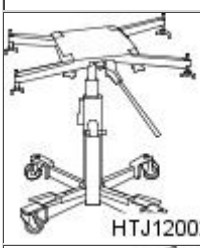

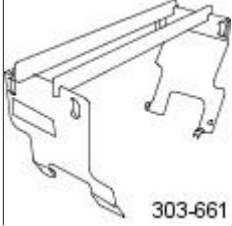

31. Remove the radiator support.

32. Using only four-wheel alignment equipment approved by Jaguar, check and adjust the wheel alignment.
For additional information, refer to: Four-Wheel Alignment (204-00, General Procedures).

- Secure the steering gear.

VUJ0005142

17. NOTE: Left-hand shown, right-hand similar.

Release the front lower arm and position it to one side.

- Mark the position of the bolt.

18. NOTE: Left-hand shown, right-hand similar.

Release the rear lower arm and position it to one side.

19. NOTE: Left-hand shown, right-hand similar.

Remove the engine mount retaining nut.

20. Install the special tool to the front subframe.

21. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe front retaining bolt.

22. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe rear retaining bolt.

23.  CAUTION: When lowering the special tool care must be taken to manoeuvre the special tool so that the front subframe does not touch the air conditioning (A/C) pipes. Failure to follow this instruction may result in damage to the A/C pipes.

Lower the special tool by approximately 200 mm (7.9 in).

24. NOTE: Left-hand shown, right-hand similar.

Remove the front stabilizer bar clamp.

25. Remove the front stabilizer bar.

Installation

1. Install the front stabilizer bar.

2. NOTE: Left-hand shown, right-hand similar.

Install the front stabilizer bar clamp.

- Tighten to 55 Nm.

3.  CAUTION: When raising the special tool care must be taken to manoeuvre the special tool so that the front subframe does not touch the air conditioning (A/C) pipes. Failure to follow this instruction may result in damage to the A/C pipes.

Install the front subframe.

4. NOTE: Left-hand shown, right-hand similar.

Install the special tool.

5. NOTE: Left-hand shown, right-hand similar.

Install the front subframe rear retaining bolt.

- Tighten to 150 Nm + 240°.

6. Remove the special tool.

7. Install the front subframe front retaining bolt.

- Tighten to 150 Nm + 240°.

8. Remove the special tool.

9. Install the front subframe front retaining bolt.

- Tighten to 150 Nm + 240°.

10. Remove the special tool.

11. NOTE: Left-hand shown, right-hand similar.

Install the engine mount retaining nut.

- Tighten to 63 Nm.

VUJ0005104

12.  CAUTION: The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Install the rear lower arm.

VUJ0005102

13.  CAUTION: The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Install the front lower arm.

VUJ0005142

14. NOTE: Left-hand shown, right-hand similar.

Install the steering gear.

- Tighten to 100 Nm.

VUJ0005262

15. NOTE: Left-hand shown, right-hand similar.

Install the front stabilizer bar link.

VUJ0005261

16. NOTE: Left-hand shown, right-hand similar.

Attach the front stabilizer bar link and install the front stabilizer bar link retaining nut.

- Tighten to 43 Nm.

17. Attach the power steering hose retaining clip to the front subframe.

18. Install the right-hand splash shield.

19. Install the radiator splash shield.

For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

20. Install the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

21. Install both the front wheel and tires.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

22. Lower the vehicle.

23.  CAUTION: The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Tighten to 175 Nm.

24.  CAUTION: The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Tighten to 175 Nm.

25. NOTE: Left-hand shown, right-hand similar.

Tighten to 70 Nm.

26. Remove the special tool.

27. Remove the special tool support bars from the special tool.

28. NOTE: Left-hand shown, right-hand similar.

Remove the retaining bolt.

29. Remove the special tool from the exhaust manifold.

- Install the retaining bolt.

30. NOTE: Left-hand shown, right-hand similar.

Tighten the exhaust manifold retaining nut.

31. Remove the radiator support.

32. Connect the battery ground cable.

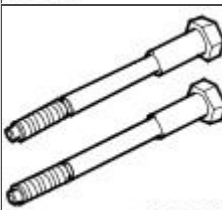

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

33. Using only four-wheel alignment equipment approved by Jaguar, check and adjust the wheel alignment.

For additional information, refer to: [Four-Wheel Alignment](#) (204-00 Suspension System - General Information, General Procedures).

Front Suspension - Front Stabilizer Bar 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8

Removal and Installation

Special Tool(s)	
 <p>HTJ12002</p>	Powertrain Assembly Jack, HTJ 1200-2
 <p>303-749</p>	Engine lifting brackets 303-749
 <p>303-021</p>	Engine support bracket 303-021
 <p>502-005</p>	Subframe Alignment Bolt 502-005

Removal

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Using suitable [tie straps](#), secure the radiator.

Vehicles without supercharger

3. Remove the throttle body.
For additional information, refer to: [Throttle Body](#) (303-04A Fuel Charging and Controls - 4.2L NA V8 - AJV8, Removal and Installation).

Vehicles with supercharger

4. Remove the air cleaner outlet pipe.
For additional information, refer to: [Air Cleaner Outlet Pipe](#) (303-12B Intake Air Distribution and Filtering - 4.2L SC V8 - AJV8, Removal and Installation).

All vehicles

5.  CAUTION: Protect the paintwork during this operation.
- NOTE: Vehicles without supercharger shown, vehicles with supercharger similar.

Install the special tools.

6. NOTE: Vehicles with supercharger shown, vehicles without supercharger similar.

- NOTE: Right-hand shown, left-hand similar.

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Install the special tool.

7.  WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

8. Remove both the front wheel and tires.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
9. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).
10. Remove the radiator splash shield.
For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

11. Remove the right-hand splash shield.

E52476

12. Detach the power steering hose retaining clip from the front subframe.

E52478

13. NOTE: Left-hand shown, right-hand similar.

Remove the front stabilizer bar link upper retaining nut.

VUJ0005261

14. NOTE: Left-hand shown, right-hand similar.

Remove the front stabilizer bar link lower retaining bolt and nut and remove the front stabilizer bar link.

VUJ0005262

VUJ0005142

15. Detach the steering gear.

- Secure the steering gear.

VUJ0005102

16. NOTE: Left-hand shown, right-hand similar.

Release the front lower arm and position it to one side.

VUJ0005104

17. NOTE: Left-hand shown, right-hand similar.

Release the rear lower arm and position it to one side.

VUJ0005532

18. NOTE: Left-hand shown, right-hand similar.

Remove the engine mount retaining nut.

19. Install the special tool to the front subframe.

20. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe front retaining bolt.

21. NOTE: Left-hand shown, right-hand similar.

Remove the front subframe rear retaining bolt.

22.  CAUTION: When lowering the special tool care must be taken to manoeuvre the special tool so that the front subframe does not touch the air conditioning (A/C) pipes. Failure to follow this instruction may result in damage to the A/C pipes.

Lower the special tool by approximately 200 mm (7.9 in).

23. NOTE: Left-hand shown, right-hand similar.

Remove the front stabilizer bar clamp.

24. Remove the front stabilizer bar.

Installation

All vehicles

1. Install the front stabilizer bar.

2. NOTE: Left-hand shown, right-hand similar.

Install the front stabilizer bar clamp.

- Tighten to 55 Nm.

3.  CAUTION: When raising the special tool care must be taken to manoeuvre the special tool so that the front subframe does not touch the air conditioning (A/C) pipes. Failure to follow this instruction may result in damage to the A/C pipes.

Install the front subframe.

4. NOTE: Left-hand shown, right-hand similar.

Install the special tool.

5. NOTE: Left-hand shown, right-hand similar.

Install the front subframe rear retaining bolt.

- Tighten to 150 Nm + 240°.

6. Remove the special tool.

7. Install the front subframe front retaining bolt.

- Tighten to 150 Nm + 240°.

8. Remove the special tool.

9. Install the front subframe front retaining bolt.

- Tighten to 150 Nm + 240°.

10. Remove the special tool.

11. NOTE: Left-hand shown, right-hand similar.

Install the engine mount retaining nut.

- Tighten to 63 Nm.

VUJ0005104

12.  CAUTION: The final tightening of the rear lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Install the rear lower arm.

VUJ0005102

13.  CAUTION: The final tightening of the front lower arm inner retaining nut and bolt must be carried out with the vehicle on its wheels.

• NOTE: Left-hand shown, right-hand similar.

Install the front lower arm.

VUJ0005142

14. NOTE: Left-hand shown, right-hand similar.

Install the steering gear.

- Tighten to 100 Nm.

VUJ0005262

15. NOTE: Left-hand shown, right-hand similar.

Install the front stabilizer bar link.

16. NOTE: Left-hand shown, right-hand similar.

Attach the front stabilizer bar link and install the front stabilizer bar link retaining nut.

- Tighten to 43 Nm.

17. Attach the power steering hose retaining clip to the front subframe.

18. Install the right-hand splash shield.

19. Install the radiator splash shield.

For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

20. Install the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

3. Remove the secondary bulkhead panel RH.
For additional information, refer to: [Secondary Bulkhead Panel RH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).

4. **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Remove the upper arm retaining nut.

5. **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Remove the upper arm retaining nut.

6. Remove the upper arm.

Installation

1. Install the upper arm.

2. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Install the upper arm retaining nut, but do not tighten fully at this stage.

3. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Install the upper arm retaining nut, but do not tighten fully at this stage.

4. Install the front shock absorber.

For additional information, refer to: [Front Shock Absorber](#) (204-01 Front Suspension, Removal and Installation).

5.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Tighten to 47 Nm.

6.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Tighten to 47 Nm.

7. Install the secondary bulkhead panel RH.
For additional information, refer to: [Secondary Bulkhead Panel RH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).

Front Suspension - Front Wheel Bearing and Wheel Hub

Removal and Installation

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the body.

- Remove the brake disc.
For additional information, refer to: [Brake Disc - Vehicles With: Standard Brakes](#) (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
- NOTE:** LH illustration shown, RH is similar.

Release the wheel speed sensor.

- Release the clip.
- Tie aside.

-  **CAUTION:** Do not attempt to release the wheel hub by hitting it with a hammer directly, loosen the wheel hub retaining bolts partially before applying an even amount of force to the head of each bolts to release the wheel hub from the wheel knuckle. Failure to follow this instruction may cause damage to the component.

- **NOTE:** Note the fitted position.
- **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.
- **NOTE:** LH illustration shown, RH is similar.

Remove the hub assembly.

- Remove and discard the 4 bolts.

Installation

- NOTE:** Align to the position noted on removal.

• **NOTE:** Make sure that all the component mating faces are clean.

Install the hub assembly.

- Clean the component mating faces.
- Tighten the bolts to 90 Nm (66 lb.ft).

- Install the wheel speed sensor.

- Secure the clip.

- Install the brake disc.
For additional information, refer to: [Brake Disc - Vehicles With: Standard Brakes](#) (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

Front Suspension - Wheel Knuckle

Removal and Installation

Special Tool(s)	
 <p>204-327</p> <p>E63732</p>	Ball joint splitter 204-327

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the hub assembly.
For additional information, refer to: [Front Wheel Bearing and Wheel Hub](#) (204-01 Front Suspension, Removal and Installation).

- NOTE:** LH illustration shown, RH is similar.

Remove the brake disc shield.

- Remove the 3 rivets.

E63733

- NOTE:** LH illustration shown, RH is similar.

- NOTE:** Use an additional wrench to prevent the ball joint rotating.

Disconnect the steering gear tie rod end ball joint.

- Remove and discard the tie rod end retaining nut.

E63734

5. NOTE: Use an additional wrench to prevent the ball joint rotating.

- NOTE: LH illustration shown, RH is similar.

Disconnect the upper arm from the wheel knuckle.

- Remove and discard the nut.

6.  CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

• NOTE: Use an additional wrench to prevent the ball joint rotating.

- NOTE: LH illustration shown, RH is similar.

Remove the wheel knuckle.

- Remove and discard the nut.
- Using the special tool, release the ball joint from the lower suspension arm.

Installation

1. NOTE: Use an additional wrench to prevent the ball joint rotating.

Install the wheel knuckle.

- Clean the component mating faces.
- Tighten the nut to 92 Nm.

2. NOTE: Use an additional wrench to prevent the ball joint rotating.

Connect the upper arm and wheel knuckle.

- Tighten the nut to 90 Nm.

3. NOTE: Use an additional wrench to prevent the component from rotating.

Connect the tie-rod end ball joint.

- Tighten the nut to 133 Nm.

E63734

4. Install the brake disc shield.

- Install the rivets.

E63733

5. Install the hub assembly.

For additional information, refer to: [Front Wheel Bearing and Wheel Hub](#) (204-01 Front Suspension, Removal and Installation).

Rear Suspension - Rear Suspension - Overview

Description and Operation

OVERVIEW

The double wishbone type rear-suspension is a fully independent design assembled on a steel subframe; large diameter bushes isolate the subframe from the vehicle's body.

A toe-link located between the wheel knuckle and the subframe is used to adjust the toe angle of the rear wheels.

The wheel knuckle attaches to the upper and lower control arms, and the coil spring and damper assembly is located between the lower control arm and the vehicle body.

Dependant on vehicle model there are three types of coil spring and damper available:

- a standard oil passive damper (All models except supercharged),
- an adaptive damper, also known as Computer Active Technology Suspension (CATS) on 4.2L supercharged vehicles up to 2010MY, For additional information refer to Vehicle Dynamic Suspension 4.2L.
- a continuously variable adaptive damper, also known as Adaptive Dynamics System on 5.0L supercharged vehicles from 2010MY. For additional information refer to Vehicle Dynamic Suspension 5.0L.

Rear Suspension - Rear Suspension - System Operation and Component Description

Description and Operation

System Operation

The double wishbone type rear-suspension is assembled on a fabricated high-grade steel subframe. Large diameter mounting bushes are used to isolate the subframe from the vehicle's body; the front bushes are hydrabushes, the rear are voided rubber.

To achieve optimum suspension refinement a cross-brace is used to increase the torsional stiffness of the subframe. The single brace attached to the shear brackets helps to reduce the transmission of road noise.

An adaptive damping system is available on specified models. For additional information refer to Vehicle Dynamic Suspension 4.2L or 5.0L.

Component Description

COMPONENTS

E94999

ItemDescription

1	Subframe
2	Stabilizer bar
3	Upper control arm
4	Spring and damper assembly
5	Toe link
6	Wheel knuckle
7	Wheel hub and bearing assembly
8	Stabilizer bar link
9	Lower control arm

Upper Control Arm

The cast aluminum upper control arm locates to the subframe via one cross-axis joint and one plain rubber bush, and links to the aluminum wheel knuckle via an integral ball-joint.

Lower Control Arm

The aluminum lower arm locates to the subframe via one cross-axis joint and one plain rubber bush, and to the wheel

knuckle via a second plain rubber bush.

The rear of the control arm has mounting points for the damper and the stabilizer link.

Toe-Link

The toe-link is located between the wheel knuckle and brackets on the subframe.

The toe-link comprises an inner rod with integral axial ball joint. The inner ball joint has a threaded spigot which locates in a bracket on the subframe and is secured with a locknut. The rod has an internal thread which accepts the outer rod.

The outer rod has a cross-axis joint at its outer end which is located in a clevis on the wheel knuckle, and is secured with a bolt and locknut.

The length of the toe-link can be adjusted by rotating the inner rod. This allows for adjustment of the toe angle for the rear wheel. Once set the inner rod can be locked in position by tightening a locknut on the outer rod against the inner rod.

Wheel Knuckle

The cast aluminum wheel knuckle attaches to:

- the upper control arm via a ball-joint located in the arm,
- the lower control arm via a plain rubber bush located in the arm,
- the toe-link via a cross-axis joint located in the toe link.

The wheel knuckle also provides the mounting locations for the:

- wheel hub assembly,
- wheel bearing,
- wheel speed sensor,
- brake caliper,
- and disc shield.

Stabilizer Bar

The solid construction stabilizer bar and bushes have been designed to provide particular characteristics in maintaining roll rates, specifically in primary ride comfort. There are four derivatives of rear stabilizer bar, with different diameters, to support the various powertrains:

- V6 gasoline - 12.7 mm solid bar
- V8 4.2L and 5.0L gasoline - 13.6 mm solid bar
- V6 2.7L diesel - 14.5 mm solid bar
- V6 3.0L diesel - 14.5 mm solid bar
- V8 4.2L gasoline supercharged – 16mm tubular
- V8 5.0L gasoline supercharged - 18 mm tubular

The stabilizer bar is attached to the top of the subframe with two bushes and mounting brackets. The stabilizer bar has crimped, 'anti-shuffle' collars pressed in position on the inside edges of the bushes. The collars prevent sideways movement of the stabilizer bar.

Each end of the stabilizer bar curves rearward to attach to a ball joint on each stabilizer link. Each link is attached via a second ball joint to a cast bracket on the lower control arm. The links allow the stabilizer bar to move with the wheel travel providing maximum effectiveness.

Spring and Damper Assembly

The spring and damper assembly are attached to cast brackets on the lower control arms and to the vehicle body by four studs secured by locking nuts. Depending on vehicle model there are three types of coil spring and damper available:

- a standard oil passive damper (All models except supercharged),
- an adaptive damper, also known as Computer Active Technology Suspension (CATS) on 4.2L supercharged vehicles up to 2010MY. For additional information refer to Vehicle Dynamic Suspension 4.2L.
- a continuously variable adaptive damper, also known as Adaptive Dynamics System on 5.0L supercharged vehicles from 2010MY. For additional information refer to Vehicle Dynamic Suspension 5.0L.

The dampers are a monotube design with a spring located by a circlip onto the damper tube. The lower end of the damper has a spherical joint which locates in the lower control arm and is secured with a bolt.

The damper piston is connected to a damper rod which is sealed at its exit point from the damper body. The threaded outer end of the damper rod locates through a hole in the top mount. A self locking nut secures the top mount to the damper rod. The damper rod on the adaptive damper has an electrical connector on the outer end of the damper rod.

Supercharged 4.2L vehicles up to 2010MY: The damper functions by restricting the flow of hydraulic fluid through internal galleries in the damper's piston. The adaptive damper has a solenoid operated valve, which when switched allows a greater flow of hydraulic fluid through the damper's piston. This provides a softer damping characteristic from the damper. The adaptive damper defaults to a firmer setting when not activated. The solenoid is computer controlled and can switch between soft and hard damping settings depending on road wheel inputs and vehicle speed.

Supercharged 5.0L vehicles from 2010MY: The variable damper functions by adjustment of a solenoid operated variable orifice, which opens up an alternative path for oil flow within the damper. When de-energized the bypass is closed and all the oil flows through the main (firm) piston. When energized the solenoid moves an armature and control blade, which work against a spring. The control blade incorporates an orifice which slides inside a sintered housing to open up the bypass as required. In compression, oil flows from the lower portion of the damper through a hollow piston rod, a separate soft (comfort) valve, the slider housing and orifice and into the upper portion of the damper, thereby bypassing the main (firm) valve. In rebound the oil flows in the opposite direction

The damper rod is fitted with a spring aid which prevents the top mount making contact with the top of the damper body during full suspension compression and also assists with the suspension tune.

The spring rate of the coil springs can differ between models and are color coded for identification. The coil spring locates on a spring packer and a lower spring seat which is located on the damper body. The spring locates in an upper spring seat which is located on the underside of the top mount. The majority of the roll stiffness is provided by the springs rather than the stabilizer bar as this arrangement allows for a natural frequency of roll, providing a consistent suspension ride.

Rear Suspension - Rear Suspension

Diagnosis and Testing

For Diagnosis and Testing information.

REFER to: [Suspension System](#) (204-00 Suspension System - General Information, Diagnosis and Testing).

Rear Suspension - Upper Arm

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise the vehicle.

2. Remove the wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
3. Release the high intensity discharge (HID) sensor link rod.

4. Release the anti-lock brake system (ABS) sensor wiring harness.

5. Release the upper arm from the wheel knuckle.

6. Remove the upper arm.

VUJ0004944

Installation

1. To install, reverse the removal procedure.
2. Tighten to 98 Nm.

VUJ0004944

3. Tighten to 96 Nm.

E31031

Rear Suspension - Lower Arm

Removal and Installation

Removal

- NOTE: Before commencing work on the vehicle ensure the park brake is in the off position.
- NOTE: LH shown RH similar.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise the vehicle.

2. Remove the wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
3. Release the shock absorber and spring assembly from the lower arm.

4. Release the rear stabilizer bar link.

5.  **CAUTION:** Do not allow the brake caliper to hang on the brake hose.

- NOTE: Make sure that new bolts are installed.

Release the rear brake caliper and tie aside.

6. Release the lower arm from the wheel hub assembly.

7. Remove the lower arm.

Installation

1.  CAUTION: Nuts and bolts must be tightened with the weight of the vehicle on the suspension.

Install the lower arm.

2.  CAUTION: Nuts and bolts must be tightened with the weight of the vehicle on the suspension.

Secure the lower arm to the wheel hub assembly.

E30550

3.  CAUTION: Do not allow the brake caliper to hang on the brake hose.

• NOTE: Make sure that new bolts are installed.

Secure the rear brake caliper.

- Tighten the bolts to 103 Nm.

VUJ0005162

4. Secure the rear stabilizer bar link.

- Tighten the nut to 48 Nm.

VUJ0005161

5.  CAUTION: Nuts and bolts must be tightened with the weight of the vehicle on the suspension.

Secure the shock absorber and spring assembly to the lower arm.

6. Install the wheel and tire.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

7. Lower the vehicle.

8. Tighten to 175 Nm.

E30548

9. Tighten to 190 Nm.

10. Tighten to 133 Nm.

Rear Suspension - Shock Absorber and Spring Assembly

Removal and Installation

Removal

All vehicles

1. Remove the luggage compartment side trim panel.
For additional information, refer to: [Loadspace Trim Panel LH](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Vehicles with active damping

2. Disconnect the active suspension damper electrical connector.

E30546

All vehicles

3. Remove the shock absorber and spring assembly top mount nuts. TORQUE: 28 Nm

E30547

4.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise the vehicle.

5. Remove the wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

6. **NOTE:** Do not disassemble further if the component is removed for access only.

Remove the shock absorber and spring assembly. TORQUE: 133 Nm

VUJ0000382

Vehicles with active damping

7. WARNINGS:

 Make sure the shock absorber is secured by fully inserting the locking pin in to the special tool. Failure to follow these instructions may result in personal injury.

 As the spring is under extreme tension care must be taken at all times. Failure to follow these instructions may result in personal injury.

 Make sure that a new nut is installed.

Using the special tool, compress the suspension spring to remove the shock absorber.

- Compress the spring.
- Remove the nut. TORQUE: 27 Nm

Vehicles without active damping

8. WARNINGS:

 Make sure the shock absorber is secured by fully inserting the locking pin in to the special tool. Failure to follow these instructions may result in personal injury.

 As the spring is under extreme tension care must be taken at all times. Failure to follow these instructions may result in personal injury.

 Make sure that a new nut is installed.

Using the special tool, compress the suspension spring to remove the shock absorber.

- Compress the spring.
- Remove the nut. TORQUE: 50 Nm

All vehicles

9. Remove the shock absorber rod components.

E94930

Installation

All vehicles

1. Install the shock absorber rod components.

E94930

Vehicles with active damping

2. WARNINGS:

 Make sure the shock absorber is secured by fully inserting the locking pin in to the special tool. Failure to follow these instructions may result in personal injury.

 As the spring is under extreme tension care must be taken at all times. Failure to follow these instructions may result in personal injury.

 Make sure that a new nut is installed.

Using the special tool, compress the suspension spring to install the shock absorber.

- Compress the spring.
- Tighten the nut to 27 Nm.

Vehicles without active damping

3. WARNINGS:

 Make sure the shock absorber is secured by fully inserting the locking pin in to the special tool. Failure to follow these instructions may result in personal injury.

 As the spring is under extreme tension care must be taken at all times. Failure to follow these instructions may result in personal injury.

 Make sure that a new nut is installed.

Using the special tool, compress the suspension spring to install the shock absorber.

- Compress the spring.
- Tighten the nut to 50 Nm.

4. Install the shock absorber and spring assembly.

- Tighten to 133 Nm.

5. Install the wheel and tire.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

All vehicles

E30547

6. Install the shock absorber and spring assembly top mount nuts.

- Tighten to 28 Nm.

Vehicles with active damping

E30546

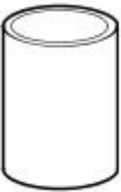

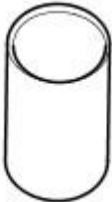

7. Connect the active suspension damper electrical connector.

All vehicles

Rear Suspension - Shock Absorber Lower Bushing

Removal and Installation

Special Tool(s)	
 E52622	Bushing Remover / Installer 204-335
 E52621	Bushing remover 204-533
 E52620	Bushing installer 204-534

Removal

-  **WARNING:** Failure to follow this instruction may cause damage to the vehicle.

Mark the orientation of the shock absorber in relation to the lower suspension arm.

- Remove the shock absorber and spring assembly.
For additional information, refer to: [Shock Absorber and Spring Assembly](#) (204-02 Rear Suspension, Removal and Installation).
- NOTE:** Place the shock absorber with the recessed side facing upwards.

- NOTE:** With assistance make sure the special tool is aligned.

Using the special tool, support the shock absorber.

- NOTE:** Position the special tool onto the recessed side of the shock absorber.
- Using the special tools, carefully remove the bushing from the shock absorber.

- NOTE:** With assistance make sure the special tool is aligned.

Position and align the special tool to the shock absorber bushing.

1. NOTE: Make sure the bush is clean and free from oil or grease.

• NOTE: Use a suitable lubricant to allow the bush to locate into the special tool.

Locate the new bushing in the special tool.

E52159

E52160

2.  WARNING: Failure to follow this instruction may cause damage to the vehicle.

• NOTE: Make sure the shock absorber is clean and free from oil or grease and is not damaged prior to pushing in the new bush.

• NOTE: Make sure the bush is installed following the same direction as removal.

• NOTE: Make sure correct alignment is maintained.

Using the special tools, align the bushing to the shock absorber.

E52161

3. NOTE: Make sure correct alignment is maintained.

Slowly push the bush into the shock absorber until the tool reaches the stop.

4. Install the shock absorber and spring assembly.

For additional information, refer to: [Shock Absorber and Spring Assembly](#) (204-02 Rear Suspension, Removal and Installation).

Rear Suspension - Rear Stabilizer Bar

Removal and Installation

Special Tool(s)	
 <p>HTJ12002</p>	Powertrain Assembly Jack, HTJ
	1200-2

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.
3. Remove both rear wheels and tires.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
4. Drain the fuel tank.
For additional information, refer to: Fuel Tank Draining (310-00 Fuel System - General Information, General Procedures).
5. Remove the exhaust system.
For additional information, refer to: Front Muffler (309-00 Exhaust System - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

6.  **CAUTION:** Always plug any open connections to prevent contamination.

- **NOTE:** To prevent the loss of brake fluid, using the special tool apply the brake pedal and set to 40mm (1.6 in) below the rest position.

- **NOTE:** RH illustration shown, LH is similar.

Disconnect the brake hose from the brake caliper.

- Using the special tool, press and hold the brake pedal.
- Remove and discard the two sealing washers.

7. **NOTE:** Left-hand shown, right-hand similar.

Release the brake caliper.

- Remove and discard the 2 bolts.
- Tie the brake caliper aside.

8. NOTE: Left-hand shown, right-hand similar.

Disconnect the rear wheel speed sensor.

9. Disconnect the electronic parking brake actuator electrical connector.

10. NOTE: Left-hand shown, right-hand similar.

Disconnect both parking brake cables from the rear brake calipers.

11. NOTE: Left-hand shown, right-hand similar.

Detach the shock absorber.

12. Detach the fuel filler hose.

13.  CAUTION: Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft.

Detach the driveshaft from the rear drive axle flange.

- Mark the position of the driveshaft in relation to the rear drive axle flange.
- Mark the position of the balance nut in relation to the rear drive axle flange. (if fitted).
- Mark the position of each nut and bolt in relation to the driveshaft flexible joint.

14. NOTE: Left-hand shown, right-hand similar.

Remove the rear subframe reinforcement plate retaining bolts.

15. Install the special tool to support the rear subframe.

16. NOTE: Left-hand shown, right-hand similar.

Remove the rear subframe rear retaining bolt.

E31123

17. NOTE: Left-hand shown, right-hand similar.

Remove the rear subframe front retaining bolt.

3	Tire pressure receiver
4	Tire pressure monitoring system initiator

Wheels and Tires - Wheels and Tires - Overview

Description and Operation

OVERVIEW

A number of alloy wheel designs are available ranging from 17 to 20 inch in diameter. A Tire Pressure Monitoring System (TPMS) is used to monitor the air pressure in each tire and inform the driver if the pressure falls below predetermined thresholds.

Refer to: [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation).

All wheels are of cast construction in aluminum alloy with the choice of wheel design dependant on the vehicle trim level:

- The 17 inch wheel, not available in North America, is available on Luxury vehicles.
- The two variants of the 18 inch wheel are offered on the High Luxury vehicle.
- The 19 inch wheel is an optional fit for both Luxury and High Luxury models; it will also be available with run-flat tires.
- The 20 inch wheel is available on Super Charged vehicles only.

A 4J X 18 inch temporary spare wheel is supplied as standard, although in some major European markets an Instant Mobility System is offered as an alternative to the spare wheel. The Instant Mobility System is capable of providing a temporary repair and tire inflation to a puncture of up to 6mm in diameter in the tread area of the tire. A puncture in the tire wall cannot be repaired using the system.

The vehicle jack and accessories are stored in the spare wheel-well in the luggage compartment.

Tire Changing

• WARNINGS:

Tires must be inflated to the recommended pressures when the tires are cold (ambient temperature) only. Refer to label on the 'B' pillar for recommended tire pressures. If the tires have been subjected to use or exposed to direct sunlight, move the vehicle into a shaded position and allow the tires to cool before checking or adjusting the pressures.

Valve stem seal, washer nut, valve core and cap should be replaced at every tire change. Valve stem seal, washer and nut must be replaced if the valve retention nut is loosened. Sensor units and nuts must be fitted using correct torque figures and associated profile. Damage to the vehicle and consequently injury to the vehicle's occupants may result if these instructions are not adhered to.

Vehicles fitted with TPMS can be visually identified by an external metal locknut and valve of the tire pressure sensor on the road wheels. Vehicles without TPMS will have rubber tire valve.

E45549

ItemDescription

1	Tire valve and pressure sensor
2	Tire fitting/removal tool initial start position
3	High tire and bead tension area
4	Low tire and bead tension area

When removing the tire, the bead breaker must not be used within 90 degrees of the tire valve in each direction on each side of the tire.

When using the tire removal machine, the fitting arm start position must be positioned as shown in the tire changing illustration for each side of the tire. The wheel can then be rotated through 180 degrees in a counter-clockwise direction. This will relieve tension from the tire bead allowing the remaining 180 degrees of the tire to be manually pulled from the rim.

When refitting the tire, position the fitting arm as shown. Rotate the tire and take care that the bead on the low tension side of the tire does not damage the sensor.

Run-Flat Tires

Run-flat tires can be handled, fitted and removed using the same principles as used for normal low profile and high-performance tires, with two exceptions:

- They are always fitted with tire pressure sensors.
- They have thicker bead cores and more rigid sidewalls which require special care when being mounted on the rims.

It is recommended that the tire fitting machine is fitted with plastic rollers for the upper and lower bead. This will ensure that the bead is removed gently, protecting the rims and the tire pressure sensors.

Adequate amounts of special fitting lubricant must be used to ensure that the sidewalls move with the minimum exertion and locate on the rim flange correctly.

Run-flat tires can be identified by the marking 'RSC' on the tire sidewall.

- **NOTE:** Vehicles fitted with run-flat tires are not supplied with a spare wheel, vehicle jack or wheel brace.

TREAD Act - NAS Only

Vehicles supplied to the North American markets must comply with the legislation of the Transport Recall Enhancement, Accountability and Documentation (TREAD) act. Part of the requirement of the TREAD act is for the vehicle to display a label which defines the recommended tire inflation pressure, load limits and maximum load of passengers and luggage weight the vehicle can safely carry. This label will be specific to each individual vehicle and will be installed on the production line. The label is positioned on the driver's side 'B' pillar on NAS vehicles and the inside rear face of the LH door on Canadian specification vehicles.

This label must not be removed from the vehicle. The label information will only define the specification of the vehicle as it came off the production line. It will not include dealer or owner fitted accessory wheels and tires of differing size from the original fitment.

If the label is damaged or removed for body repair, it must be replaced with a new label specific to that vehicle. A new label is requested from Jaguar parts and will be printed specifically for the supplied VIN of the vehicle.

Tire Pressure Monitoring System

The Tire Pressure Monitoring System (TPMS) is a driver assistance system which assists the driver to maintain the tire pressures at the optimum level. TPMS is standard fitment on NAS vehicles and an optional fitment in other markets. TPMS provides the following benefits:

- Maintain optimal fuel consumption.
- Maintain ride and handling characteristics.
- Reduce the risk of rapid tire deflation - which may be caused by under inflated tires.
- Comply with legislation requirements in relevant markets.

CAUTION: TPMS is not intended as a replacement for regular tire pressure and tire condition checks and should be considered as additional to good tire maintenance practices.

The TPMS measures the pressure in each of the vehicle's tires and issues warnings to the driver if any of the pressures deviate from defined tolerances. The space saver spare wheel is not monitored.

- **NOTE:** TPMS is not designed to warn the driver of a tire 'blow-out', as due to the short duration of a 'blow-out', it is not possible to give the driver sufficient warning that such an event is occurring. The design of the TPMS is to assist the driver in keeping the tires at the correct pressure, which will assist to reduce the likelihood of a tire 'blow-out' occurring.

Wheels and Tires - Wheels and Tires - System Operation and Component Description

Description and Operation

Control Diagram

3	CJB (central junction box)
4	RJB (rear junction box)
5	TPMS receiver
6	Tire pressure sensors
7	Initiators
8	TPMS module
9	Instrument cluster

System Operation

Tire Pressure Monitoring System

The controlling software for the Tire Pressure Monitoring System (TPMS) is located within a Tire Pressure Monitoring System Module. The software detects the following:

- When the tire pressure is below the recommended low pressure value - under inflated tire.
- The location of the tire on the vehicle that is below the recommended pressure.
- Malfunction warning.

The TPMS system comprises:

- Tire pressure monitoring system module located below the right-hand front seat.
- Tire pressure receiver located near the gear shifter within the floor console.
- Two front initiators positioned forward of the wheels and behind the fender splash shields.
- Two rear initiators positioned rearward of the wheels and assembled on dedicated brackets located behind the fender splash shields.
- Four sensors, each sensor is integral with a tire valve and located within the tire; the space saver spare wheel is not fitted with a sensor.

The four initiators are hard wired to the TPMS module. The initiators transmit 125 KHz Low Frequency (LF) signals to the tire pressure sensors which respond by modifying the mode status within the Radio Frequency (RF) transmission. The 315 or 433 MHz RF signals are detected by the tire pressure receiver which is connected directly to the TPMS module. The received RF signals from the tire pressure sensors are passed to the TPMS module and contain identification, pressure, temperature and acceleration information for each wheel and tire.

The TPMS module communicates with the instrument cluster via the medium speed CAN bus to provide the driver with appropriate warnings. The TPMS module also indicates status or failure of the TPMS or components.

Tire Location and Identification

The TPMS can identify the position of the wheels on the vehicle and assign a received tire pressure sensor identification to a specific position on the vehicle, for example front left, front right, rear left and rear right. This feature is required because of the different pressure targets and threshold that could exist between the front and rear tires.

The wheel location is performed automatically by the TPMS module using an 'auto-location' function. This function is fully automatic and requires no input from the driver. The TPMS module automatically re-learns the position of the wheels on the vehicle if the tire pressure sensors are replaced or the wheel positions on the vehicle are changed.

The TPMS software can automatically detect, under all operating conditions, the following:

- one or more new tire pressure sensors have been fitted
- one or more tire pressure sensors have stopped transmitting
- TPMS module can reject identifications from tire pressure sensors which do not belong to the vehicle
- two 'running' wheels on the vehicle have changed positions.

If a new tire pressure sensor is fitted on any 'running' wheel, the module can learn the new sensor identification automatically through the tire learn and location process.

The tire-learn and location process is ready to commence when the vehicle has been stationary or traveling at less than 12 mph (20 km/h) for 15 minutes. This is known as 'parking mode'. The learn/locate process requires the vehicle to be driven at speeds of more than 12 mph (20 km/h) for 15 minutes. If the vehicle speed reduces to below 12 mph (20 km/h), the learn process timer is suspended until the vehicle speed increases to more than 12 mph (20 km/h), after which time the timer is resumed. If the vehicle speed remains below 12 mph (20 km/h) for more than 15 minutes, the timer is set to zero and process starts again.

Low Pressure Monitoring

The tire low pressure sensor transmits by RF (315 MHz or 433 MHz depending on market) signal. These signals contain data which corresponds to tire low pressure sensor identification, tire pressure, tire temperature, acceleration and tire low pressure sensor mode.

Each time the vehicle is driven, the tire pressure monitoring system module activates each LF antenna in turn. The corresponding tire low pressure sensor detects the LF signal and responds by modifying the mode status within the RF transmission.

The system enters 'parking mode' after the vehicle speed has been less than 20 km/h (12.5 miles/h) for 12 minutes. In parking mode the tire low pressure sensors transmit a coded signal to the tire pressure monitoring system module once every 13 hours. If the tire pressure decreases by more than 0.06 bar (1 lbf/in²) the tire low pressure sensor will transmit more often as pressure is lost.

As each wheel responds to the LF signal from the tire pressure monitoring system module, it is assigned a position on the vehicle and is monitored for the remainder of that drive cycle in that position.

When the vehicle has been parked for more than 15 minutes and then driven at a speed of more than 20 km/h (12.5 miles/h), the antennas fire in turn for 6 seconds on all except North American specification vehicles or for 18 seconds on North American specification only vehicles in the following order:

- Front left
- Six second pause (for the tire pressure monitoring system module to detect a response from the tire low pressure sensor)
- Front right
- Six second pause
- Rear right
- Six second pause
- Rear left

- Six second pause

Each tire low pressure sensor responds in turn so the tire pressure monitoring system module can establish the tire low pressure sensor positions at the start of the drive cycle. This process is repeated up to three times but less if the tire low pressure sensor positions are already known in the tire pressure monitoring system module.

This process is known as 'Auto Location' and takes:

- three to five minutes on all except North American specification vehicles to complete, and
- seven to eight minutes on North American specification vehicles to complete.

During this period the tire low pressure sensors transmit at regular intervals:

- once every 5 seconds on all except North American specification vehicles, and
- once every 15 seconds on North American specification vehicles.

For the remainder of the drive cycle the tire low pressure sensors transmit once every 60 seconds or if a change in tire pressure is sensed until the vehicle stops and the tire pressure monitoring system returns to parking mode.

Once the wheel position is established, the antennas stop firing and do not fire again until the vehicle has been parked for more than 15 minutes. The signal transmissions from each tire low pressure sensor continue at one minute intervals whilst the vehicle is being driven. This transmission is to monitor the tire pressure. The warning occurs at 25% deflation and comprises the low tire pressure warning indicator and an appropriate message displayed in the instrument cluster message center. The message center will also display additional information about the position of the affected wheel(s).

Spare Tire Monitoring

Tire pressure sensors are not fitted to the space saver spare wheel and therefore the spare wheel is not monitored.

Component Description

Initiator

E45552

Each initiator has a connector which connects to the vehicle body harness. The initiator is a passive, LF transmitter. The initiators transmit their signals which are received by the tire pressure sensors, prompting them to modify their mode status.

The TPMS module energizes each initiator in turn using LF drivers. The corresponding tire pressure sensor detects the LF signal and responds by modifying the mode status within the RF transmission.

Tire Pressure Sensor

E45553

The TPMS uses active tire pressure sensors which are located on each wheel, inside the tire cavity. The sensor incorporates the tire valve and is secured in the wheel by a nut on the outside of the wheel. The sensor contains a Printed Circuit Board which houses a **PTC (positive temperature coefficient)** sensor, a Piezo pressure sensor, a radio receiver and transmitter and a lithium battery.

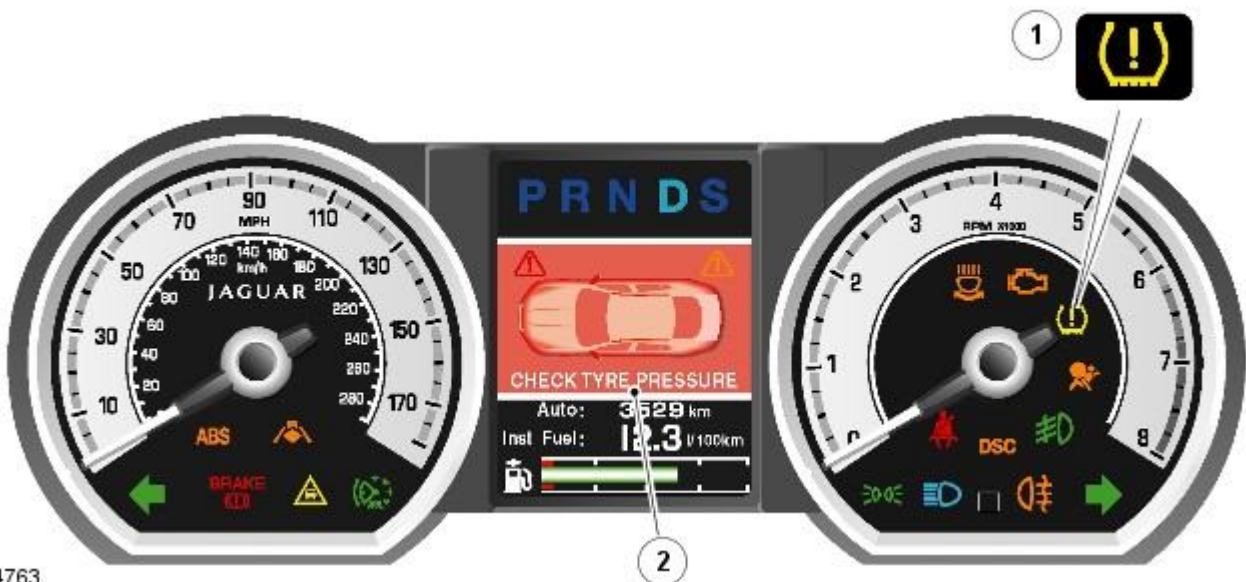

The tire pressure sensors use the PTC sensor and the Piezo sensor to periodically measure the pressure and temperature of the air inside the tire. The data is transmitted by RF data signals at either 315 MHz or 433 MHz dependant on market requirements.

The RF transmission from the sensor contains a unique identification code in its transmission data. This allows the TPMS to identify the wheel on the vehicle. If the sensor is replaced on a wheel, the new sensor identification will be learnt through the learn and location process.

The tire pressure sensor can also detect when the wheel is rotating. In order to preserve battery power, the sensor uses different transmission rates when the wheel is stationary or moving.

• **NOTE:** For important information regarding the removal and fitting of tire pressure sensors and associated valves, see the **Tire Changing** section.
Refer to: [Wheels and Tires](#) (204-04 Wheels and Tires, Description and Operation).

Instrument Cluster Indications

E94763

ItemDescription

- | | |
|---|-------------------------------------|
| 1 | Low tire pressure warning indicator |
| 2 | Message center |

The warning indications to the driver are common on all vehicles fitted with TPMS. The driver is alerted to system warnings by a low tire pressure warning indicator in the instrument cluster and an applicable text message in the message centre.

The TPMS module passes system status information to the instrument cluster on the medium speed CAN bus. The instrument cluster converts this data into illumination of the warning indicator and the display of an appropriate message.

When the ignition is switched on, the warning indicator is illuminated for 3 seconds for a bulb check.

- NOTE: If the vehicle is not fitted with the TPMS, the warning indicator will not illuminate.

The instrument cluster checks, within the 3 second bulb check period, for a CAN bus message from the TPMS. During this time the TPMS performs internal tests and CAN bus initialization. The warning indicator will be extinguished if the TPMS module does not issue a fault message or tire pressure warning message.

If a TPMS fault warning message is detected by the instrument cluster at ignition on, the warning indicator will flash for 72 seconds after the 3 second bulb check period and then remain permanently illuminated.

If a tire pressure warning message is detected by the instrument cluster at ignition on, the warning indicator will extinguish briefly after the 3 second bulb check period, before re-illuminating to indicate a tire pressure warning.

The following table shows the warning indicator functionality for given events:

Event	Instrument Cluster Indications
Low pressure warning limit reached in one wheel	Warning indicator illuminated. 'CHECK TYRE PRESSURE' message displayed and applicable tire highlighted on display.
Low pressure warning limit reached in one or more wheels in low speed mode (only if programmed or learning)	Warning indicator illuminated. 'CHECK ALL TYRE PRESSURES' message displayed.
TPMS fault	Warning indicator flashes for 72 seconds and is then permanently illuminated. The flash sequence repeats after ignition on cycle. 'TYRE PRESSURE SYSTEM FAULT' message displayed.
No transmission from a specific tire pressure sensor or Specific tire pressure sensor fault	Warning indicator flashes for 72 seconds and is then permanently illuminated. The flash sequence repeats after ignition on cycle. 'TYRE NOT MONITORED' message displayed.
No transmission from more than one tire pressure sensor or more than one tire pressure sensor fault	Warning indicator flashes for 72 seconds and is then permanently illuminated. The flash sequence repeats after ignition on cycle. 'TYRE PRESSURE SYSTEM FAULT' message displayed.
CAN signals missing	Warning indicator flashes for 72 seconds and is then permanently illuminated. The flash sequence repeats after ignition on cycle. 'TYRE PRESSURE SYSTEM FAULT' message displayed.
Vehicle enters high speed mode (only available in certain markets)	Warning indicator illuminated. 'TYRE PRESSURE LOW FOR SPEED' message displayed.

Wheels and Tires - Wheels and Tires

Diagnosis and Testing

Principle of Operation

For a detailed description of the wheels and tires, refer to the relevant Description and Operation section in the workshop manual. REFER to: (204-04 Wheels and Tires)

[Wheels and Tires](#) (Description and Operation),
[Wheels and Tires](#) (Description and Operation),
[Wheels and Tires](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer complaint. As much information as possible should be gathered from the driver to assist in diagnosing the cause(s). Confirm which of the following two warning types exist for the TPMS
 - **Check tyre pressure warnings.** A low tire pressure warning will continuously illuminate the low tire pressure warning lamp. This warning will generate a text message CHECK TYRE PRESSURE. No Diagnostic Trouble Codes (DTCs) are generated with this type of warning.
 - **NOTE:** Tire pressure adjustments are part of routine owner maintenance. Tire pressure adjustments that are required due to a lack of owner maintenance are not to be claimed under vehicle warranty. To extinguish this warning it is essential that, with the ignition 'ON', all vehicle tires are to be set to the correct pressure as stated in the vehicle handbook or as indicated on the placard label in the passenger/driver door aperture
 - **System fault warnings.** When a system fault is detected, the low tire pressure warning lamp will flash for approximately 75 seconds prior to being continuously illuminated. This indicates the presence of a system fault.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Tire pressures ● Tire/Wheel damage. Refer to component tests in this section ● Tire low pressure sensor installation/damage (metal valve stems as opposed to rubber) 	<ul style="list-style-type: none"> ● Fuses

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.
5. 5. If the tester fails to communicate with the TPMS module, it is recommended that the TPMS power supply fuse is removed from the Rear Junction Box (RJB) for approximately 10 seconds and re-installed.

Drive Cycle

The vehicle must remain stationary for 15 minutes. Carry out a road test, for a minimum of 15 minutes at a speed greater than 12.5 mph (20 kph) for at least 75% of the road test.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only five digit codes. If this is the case, match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

• **NOTE:** When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action
C1A5631	Left Front Tire Pressure Sensor and	<ul style="list-style-type: none"> ● No signal ● Missing, incompatible or 	GO to Pinpoint Test E .

REFER to: Tire Low Pressure Sensor (204-04 Wheels and Tires, Removal and Installation).
<p>Component Tests</p> <p>Wheels and Tires</p> <p>For wheel and tire specification information (pressures, torques, etc), refer to the specification section in 204-04.</p>			

When replacing wheels or tires, local legislation regarding health and safety must be complied with.

If the vehicle has TPMS installed, only Jaguar approved wheels and tires should be used. If the wheel and tire size is changed (for example from R18 to R20) the TPMS module should be updated with the correct pressure information appropriate to the new wheel and tire set. Update the Car Configuration File using the manufacturer approved diagnostic system.

As a general guideline, only replace tires in pairs or as a set, and only with tires of equivalent size and specification.

Confirm the symptoms of the customer complaint.

As much information as possible should be gathered from the driver to assist in diagnosing the cause(s).

1. Before a road test, carry out a basic inspection to make sure the vehicle is safe and legal to drive.

Basic inspection

- Correct tire inflation
- Legal tire tread depth
- Cuts/Bulges in tire sidewall(s)
- Tire ply separation
- Embedded objects
- Wheel rim damage
- Correct tire installation (specification, direction of rotation, etc)
- Any obvious distortion of the tire (flat/high spots)
- Worn/Damaged steering or suspension components.

REFER to: [Suspension System](#) (204-00 Suspension System - General Information, Diagnosis and Testing).

Road test

If the results of the basic inspection are acceptable, carry out a road test to confirm the symptoms.

To reproduce the symptoms, test the vehicle on similar roads to those on which the fault occurs and at similar speeds (provided it is legal to do so).

If the vibration or noise can be reproduced, note the speed at which it occurs and see if it is possible to drive through the symptom, meaning, is it possible to alter the fault by driving faster or slower than the speed at which it occurs?

If it is possible, it is likely that the fault is caused by an imbalance in the wheel or tire.

If the vibration or noise gets worse as the vehicle speed increases, it is likely that the fault is caused by distortion in the wheel or tire, or worn or damaged components.

Distortion checks

Check for distortion by raising the vehicle so that the wheels are free and placing an axle stand or similar fixed object next to each wheel in turn.

If the stand is placed at the tread of the tire, the tire can be checked for ovality by turning the wheel by hand and checking for high or low spots where the gap between the tread and the stand increases or reduces.

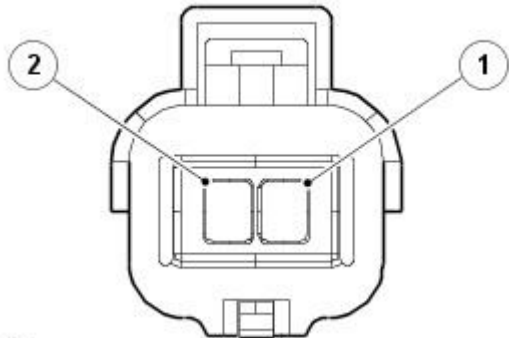

If the stand is placed next to the wheel rim or tire sidewall, the wheel and tire can be checked for run-out in a similar way.

Pinpoint Tests

PINPOINT TEST A : TPMS EXTERNAL RECEIVER DATA LINE CIRCUIT	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: CHECK THE EXTERNAL RECEIVER DATA LINE CIRCUIT FOR SHORT CIRCUIT TO GROUND	
	1 Key off.
	2 Disconnect the TPMS external receiver electrical connector, C3MC45.
	3 Measure the resistance between:
	C3MC45, harness side
	Battery
	Pin 1 Negative terminal
	Is the resistance less than 10,000 ohms? Yes GO to A3. No GO to A2.
A2: CHECK THE EXTERNAL RECEIVER DATA LINE CIRCUIT FOR SHORT CIRCUIT TO POWER	
	1 Measure the resistance between:
	C3MC45, harness side
	Battery
	Pin 1 Positive terminal
	Is the resistance less than 10,000 ohms? Yes GO to A4. No GO to A5.
A3: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE	
	1 Disconnect the TPMS module connector, C3MC39B.
	2 Measure the resistance between:
	C3MC45, harness side
	Battery
	Pin 1 Negative terminal

	<p>Is the resistance less than 10,000 ohms?</p> <p>Yes REPAIR the short circuit. For additional information, refer to the wiring diagram. C5: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

	<p>1 Disconnect the TPMS module connector, C3MC39A.</p>
--	--

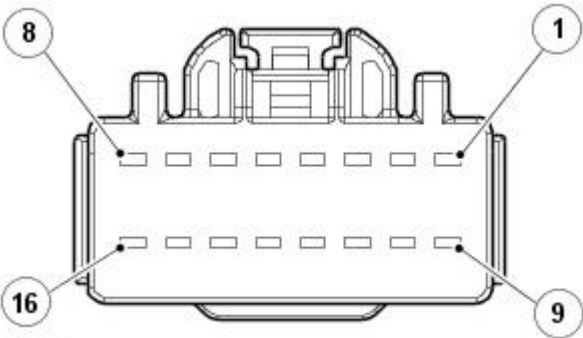

E63655

2 Measure the resistance between:	
C1MC41, harness side	Battery
Pin 2	Negative terminal

Is the resistance less than 10,000 ohms?
Yes
 REPAIR the short circuit. This circuit contains intermediate connector, C13-B. For additional information, refer to the wiring diagram. Clear the DTC and test the system for normal operation.
No
 INSTALL a new TPMS module.
 REFER to: [Tire Pressure Monitoring System \(TPMS\) Module \(204-04 Wheels and Tires, Removal and Installation\)](#).

C6: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

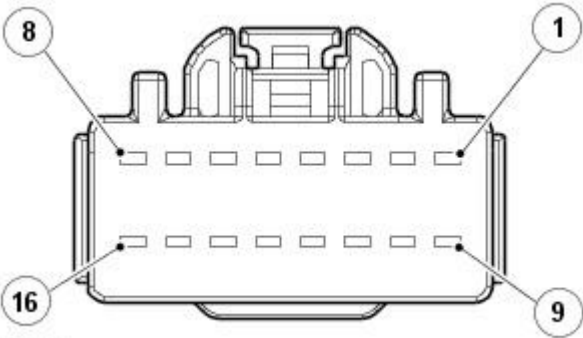

E63655

1 Disconnect the TPMS module connector, C3MC39A.	
2 Measure the resistance between:	
C1MC41, harness side	Battery
Pin 2	Positive terminal

Is the resistance less than 10,000 ohms?
Yes
 REPAIR the short circuit. This circuit contains intermediate connector, C13-B. For additional information, refer to the wiring diagram. Clear the DTC and test the system for normal operation.
No
 INSTALL a new TPMS module.
 REFER to: [Tire Pressure Monitoring System \(TPMS\) Module \(204-04 Wheels and Tires, Removal and Installation\)](#).

C7: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

E63655

1 Disconnect the TPMS module connector, C3MC39A.	
2 Measure the resistance between:	
C1MC41, harness side	Battery
Pin 1	Negative terminal

Is the resistance less than 10,000 ohms?
Yes
 REPAIR the short circuit. This circuit contains intermediate connector, C13-B. For additional information, refer to the wiring diagram. Clear the DTC and test the system for normal operation.

No
 INSTALL a new TPMS module.
 REFER to: [Tire Pressure Monitoring System \(TPMS\) Module \(204-04 Wheels and Tires, Removal and Installation\)](#).

C8: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

E63655

- 1 Disconnect the TPMS module connector, C3MC39A.
- 2 Measure the resistance between:

C1MC41, harness side	Battery
Pin 1	Positive terminal

Is the resistance less than 10,000 ohms?
Yes
 REPAIR the short circuit. This circuit contains intermediate connector, C13-B. For additional information, refer to the wiring diagram. Clear the DTC and test the system for normal operation.
No
 INSTALL a new TPMS module.
 REFER to: [Tire Pressure Monitoring System \(TPMS\) Module \(204-04 Wheels and Tires, Removal and Installation\)](#).

C9: CHECK THE INITIATOR RETURN CIRCUIT FOR HIGH RESISTANCE

- 1 Measure the resistance between:
- | C3MC39A, harness side | C1MC41, harness side |
|-----------------------|----------------------|
| Pin 16 | Pin 2 |

Is the resistance greater than 5 ohms?
Yes
 REPAIR the high resistance circuit. This circuit contains intermediate connector, C13-B. For additional information, refer to the wiring diagram. Clear the DTC and test the system for normal operation.
No
[GO to C10.](#)

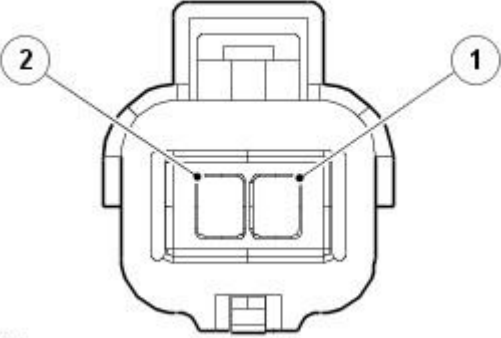

C10: CHECK THE INITIATOR POWER CIRCUIT FOR HIGH RESISTANCE

- 1 Measure the resistance between:
- | C3MC39A, harness side | C1MC41, harness side |
|-----------------------|----------------------|
| Pin 15 | Pin 1 |

Is the resistance greater than 5 ohms?
Yes
 REPAIR the high resistance circuit. This circuit contains intermediate connector, C13-B. For additional information, refer to the wiring diagram. Clear the DTC and test the system for normal operation.
No
 INSTALL a new right hand front low-frequency initiator.
 REFER to: [Tire Pressure Monitoring System Front Antenna \(204-04 Wheels and Tires, Removal and Installation\)](#).

PINPOINT TEST D : REAR LEFT LOW-FREQUENCY INITIATOR CIRCUIT

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: CHECK THE INITIATOR RETURN CIRCUIT FOR SHORT CIRCUIT TO GROUND	
	1 Key off.
	2 Disconnect the left hand rear low-frequency initiator electrical connector, C4MC42.

PINPOINT TEST F : MISSING, INCOMPATIBLE OR DEFECTIVE RUNNING TIRE LOW PRESSURE SENSOR OR RECEIVER

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: CHECK FOR CORRECT WHEEL AND TIRE ASSEMBLY AND TIRE LOW PRESSURE SENSOR	
	<ul style="list-style-type: none"> NOTE: One way of identifying if a tire low pressure sensor is installed to a wheel and tire assembly is by a metal valve stem rather than rubber. A tire low pressure sensor cannot be installed to a space saver spare wheel.
	<p>1 Check that the wheel and tire assembly installed to the applicable position on the vehicle is a full size wheel and tire with a tire low pressure sensor installed.</p>
	<p>Is a full size wheel and tire assembly with tire low pressure sensor installed?</p> <p>Yes GO to F2.</p> <p>No Install the correct wheel and tire assembly or tire low pressure sensor, of correct frequency, in accordance with that defined in the manufacturer approved diagnostic system new tire low pressure sensor application.</p>
F2: CHECK FOR ADDITIONAL DTCS	
	<p>1 Check for additional DTCS C1A5631, C1A5831, C1A6031, C1A6231.</p>
	<p>Have all four DTCS logged in the tire pressure monitoring system module?</p> <p>Yes Suspect the tire pressure monitoring system receiver. Check and install a new receiver as required. REFER to: Tire Pressure Monitoring System (TPMS) Receiver (204-04 Wheels and Tires, Removal and Installation).</p> <p>No GO to F3.</p>
F3: VERIFY THE POSITION OF THE DEFECTIVE TIRE LOW PRESSURE SENSOR	
	<p>1 Clear DTCS and carry out Drive Cycle as outlined in Inspection and Verification section above.</p>
	<p>2 Check tire pressure monitoring system DTCS.</p>
	<p>Are any C1AXX31 DTCS logged?</p> <p>Yes Install the correct tire low pressure sensor, of correct frequency, in accordance with that defined in the manufacturer approved diagnostic system new tire low pressure sensor application, to the position identified by the logged DTC. REFER to: Tire Low Pressure Sensor (204-04 Wheels and Tires, Removal and Installation).</p> <p>No No further action is required.</p>

PINPOINT TEST G : LOCALIZATION FAILURE

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
G1: CHECK FOR ADDITIONAL DTCS	
	<p>1 Check for additional DTCS: Left Front - C1A5711, C1A5712, C1A5713. Right Front - C1A5911, C1A5912, C1A5913. Left Rear - C1A6111, C1A6112, C1A6113. Right Rear - C1A6311, C1A6312, C1A6313.</p>
	<p>Are any of the DTCS listed above also logged?</p> <p>Yes Refer to the DTC Index and remedial actions. If a fault has been rectified, run On Demand Self Test routine to confirm.</p> <p>No GO to G2.</p>
G2: CHECK FOR ADDITIONAL DTCS	
	<p>1 Check for additional DTCS: C1AXX31.</p>
	<p>Is a C1AXX31 DTC also logged?</p> <p>Yes Refer to the DTC Index and remedial actions.</p> <p>No GO to G3.</p>
G3: CHECK INITIATOR INSTALLATION	
	<p>1 Check for correct installation of Initiator. REFER to: (204-04 Wheels and Tires) Tire Pressure Monitoring System Front Antenna (Removal and Installation), Tire Pressure Monitoring System Rear Antenna (Removal and Installation).</p>
	<p>Is the Initiator correctly installed?</p> <p>Yes GO to G4.</p> <p>No Rectify as required. REFER to: (204-04 Wheels and Tires) Tire Pressure Monitoring System Front Antenna (Removal and Installation), Tire Pressure Monitoring System Rear Antenna (Removal and Installation).</p>
G4: CHECK FOR SHORT CIRCUIT IN INITIATOR HARNESS	
	<p>1 Check for short circuit between Initiator power and return circuits.</p>
	<p>Has a short circuit been identified?</p> <p>Yes Rectify the short circuit as required.</p> <p>No Install the correct tire low pressure sensor, of correct frequency, in accordance with that defined in the manufacturer approved diagnostic system new tire low pressure sensor application, to the position identified by the logged DTC.</p>

PINPOINT TEST H : MISSING MESSAGE FROM RECEIVER	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
H1: CHECK TIRE PRESSURE MONITORING SYSTEM RECEIVER OR DATALINE CIRCUITS FOR OPEN CIRCUIT	
	<p>1 Check tire pressure monitoring system receiver or dataline circuits for open circuit.</p> <p>Has an open circuit fault been identified?</p> <p>Yes Rectify the open circuit as required, run On Demand Self Test routine to confirm.</p> <p>No GO to H2.</p>
H2: CHECK FOR CORRECT WHEEL AND TIRE ASSEMBLY AND TIRE LOW PRESSURE SENSOR	
	<p>• NOTE: One way of identifying if a tire low pressure sensor is installed to a wheel and tire assembly is by a metal valve stem rather than rubber. A tire low pressure sensor cannot be installed to a space saver spare wheel.</p> <p>1 Check that the wheel and tire assemblies installed to all four running wheel positions are full size wheel and tires with tire low pressure sensors installed.</p> <p>Are full size wheel and tire assemblies with tire low pressure sensors installed?</p> <p>Yes Drive the vehicle for an accumulative period of at least 19 minutes at a speed greater than 28 mph (45kph), then check for DTCs. If DTC remains install a new tire pressure monitoring system receiver. REFER to: Tire Pressure Monitoring System (TPMS) Receiver (204-04 Wheels and Tires, Removal and Installation). If no DTC, suspect RF blocking event, no further action is required.</p> <p>No Install the correct wheel and tire assembly or tire low pressure sensor, of correct frequency, in accordance with that defined in the manufacturer approved diagnostic system new tire low pressure sensor application.</p>

Wheels and Tires - Tire Low Pressure Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.
2. Refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
3. Remove the tire from the wheel, release the tire bead from the rim 180 degrees from the valve.

4.

5.

- Discard the tire valve and retaining nut.

Installation

1. **CAUTIONS:**

Make sure that the seal is correctly located.

Make sure that new components are installed.

Install the washer and seal, making sure the valve remains pressed fully onto its seat.

2. **2. WARNINGS:**

 Make sure that any corrosion or dirt is removed from the mating surfaces.

 Make sure that a new tire valve, valve core, seal, washer, cap and retaining nut is installed.

• **CAUTIONS:**

 Use lint free cloth.

 Only use moderate force when installing the sensor.

• **NOTE:** Only tighten the nut finger tight at this stage.

- Install the tire low pressure sensor and support the sensor body in position.
- Support the back of the valve stem in order to prevent rotation to the tire low pressure sensor body.
- Gently push the nut towards the center of the wheel. Tighten the nut.

Torque: 8 Nm

3. Install the tire and balance the wheel.

4. Refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

5.  **WARNING:** Make sure to support the vehicle with axle stands.

Lower the vehicle.

Wheels and Tires - Tire Pressure Monitoring System (TPMS) Front Antenna

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.

E100912

2. **NOTE:** This step requires the aid of another technician.

- NOTE: Lower the radiator splash shield enough to access the tire pressure monitoring system front antenna.

- NOTE: Note the position of the component before removal.

Installation

1.  **CAUTION:** Make sure that the component is secured in the retainer.
• NOTE: Make sure that the component is installed to the noted removal position.
To install, reverse the removal procedure.

Wheels and Tires - Tire Pressure Monitoring System (TPMS) Rear Antenna

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

3.

4. **NOTE:** Note the position of the component before removal.

Installation

1.  **CAUTION:** Make sure that the component is secured in the retainer.

- NOTE: Make sure that the component is installed to the noted removal position.

To install, reverse the removal procedure.

Wheels and Tires - Tire Pressure Monitoring System (TPMS) Module

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Switch the ignition off.

2. Remove the right-hand front seat.

Refer to: [Front Seat](#) (501-10 Seating, Removal and Installation).

3. Refer to: [B-Pillar Lower Trim Panel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

4. Detach and reposition the floor covering.

5.

6.

Installation

1. To install, reverse the removal procedure.

Wheels and Tires - Tire Pressure Monitoring System (TPMS) Receiver

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: The tire pressure monitoring system receiver is installed in the same location on both LHD and RHD vehicles.

1. Switch the ignition off.
2. Remove the left-hand floor console side trim panel.

Refer to: [Floor Console Side Trim Panel](#) (501-12 Instrument Panel and Console, Removal and Installation).

3.

4.

Installation

1. To install, reverse the removal procedure.
2. Configure the tire pressure monitoring system using the diagnostic tool.

Wheels and Tires - Wheel and Tire

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Torque: 125 Nm

Installation

1.  CAUTION: Apply a small amount of grease to the hub and wheel mating surfaces before installation. Make sure the grease does not come into contact with the vehicles braking components and the wheel stud threads. Failure to follow these instructions may result in personal injury.

To install, reverse the removal procedure.

7	Front vertical accelerometer

Vehicle Dynamic Suspension - Vehicle Dynamic Suspension4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Overview

Description and Operation

Adaptive Damping System

The adaptive damping system, also known as Computer Active Technology Suspension (CATS), is an electronically controlled suspension system which constantly adjusts the damping characteristics of the suspension dampers in reaction to the existing driving conditions. The adaptive damping system is available on specified models.

The system is controlled by an adaptive damping module, located beneath the right-hand front seat; the module receives signals from two dedicated vertical accelerometers; one at the front of the vehicle and one at the rear.

In addition to these inputs, further signals from other vehicle electronic system components are monitored by the adaptive damping module to determine vehicle body motion and driver inputs. These combined signals are used by the adaptive damping module to control the damping characteristics of each damper and switch them to either 'soft' or 'firm' to give the optimum vehicle ride for the prevailing driving conditions.

System Operation

Adaptive Damping System

The adaptive damping module uses a combination of information from other system modules and data from the accelerometer to measure the vehicle motion and driver inputs. Using this information, the module applies algorithms to control the dampers for the existing driving conditions.

The adaptive damping module receives signals on the high speed [CAN](#) bus from the following system components:

- Vehicle speed - [ABS \(anti-lock brake system\)](#) module
- Brake switch status - [ECM \(engine control module\)](#)
- Brake pressure - ABS module
- Gear position - [TCM \(transmission control module\)](#)
- Lateral acceleration - ABS module
- Throttle pedal position - ECM
- Power mode - [CJB](#) via the instrument cluster gateway
- Steering wheel angle - Steering angle sensor via ABS module
- Steering wheel speed - Steering angle sensor via ABS module
- Engine speed - ECM
- Engine running status - ECM
- Car Configuration File Data - auxiliary junction box via instrument cluster gateway
- Master configuration identification - auxiliary junction box via instrument cluster gateway
- Vehicle information parameters - auxiliary junction box via instrument cluster gateway.

The adaptive damping module also outputs information for use by other systems as follows:

- Computer Active Technology Suspension (CATS) fault - instrument cluster
- Front left damper status - ECM
- Front right damper status - ECM
- Rear left damper status - ECM
- Rear right damper status - ECM.

When the vehicle is stationary with the engine running, the dampers are set to the soft setting. With the vehicle in motion the adaptive damping module monitors the input signals and operates the damper solenoids appropriately. The input signals are compared against algorithms within the adaptive damping module and preset speed thresholds. The gear position signal is also used to determine longitudinal detection and, along with the speed signal, is compared against algorithms to select the appropriate 'soft' or 'firm' damper setting.

The adaptive damping module receives its power supply via a relay in the [CJB](#). The relay remains energized for a period of time after the ignition is off. This allows the adaptive damping module to record and store any fault codes relating to the adaptive damping system faults.

Adaptive Damping System Fault Message

The adaptive damping has a CAN connection to the instrument cluster. If a fault is detected by the adaptive damping module, a message is sent to the instrument cluster and a message 'CATS SYSTEM FAULT' is displayed.

When this message is displayed a fault has been detected and an appropriate [DTC \(diagnostic trouble code\)](#) will be logged in the module. The faults can be interrogated using the recommended Jaguar Diagnostic System.

When a fault is detected, the module stops outputs to the active dampers and the dampers operate continually on their default 'hard' setting until the fault is corrected.

Component Description

Adaptive Damping System

Dampers

The adaptive dampers are nitrogen-gas and oil-filled monotube units. The dampers have a two-stage adjustment which allows the damping force to be electrically adjusted when the vehicle is being driven. The two-stage dampers provide the optimum compromise between performance handling and ride comfort.

The adaptive dampers can be easily identified by an electrical connector on the end of the piston rod, in the center of the top mount.

The two-stage adjustment is achieved by a solenoid controlled valve. When the solenoid valve is de-energized, the damper is on its firm setting and oil flow is restricted to a controlled rate through orifices in the damper piston. The restricted oil flow stiffens the damper action improving the handling when braking, accelerating and cornering.

A

B

E72756

ItemDescription

A Firm setting

B Soft setting

The solenoid is connected to a by-pass valve which allows additional oil flow through the damper. When the solenoid is energized, the valve is lifted from its seat, allowing oil to flow through a hollow piston rod in the center of the damper piston and out through additional orifices. The increased oil flow softens the damper action providing a more comfortable ride quality.

The solenoid is operated by a 400 Hz [PWM \(pulse width modulation\)](#) signal from the adaptive damping module. When energized, the module applies a 1.3 ampere push current for 75 milliseconds to move the valve and then applies a 0.5 ampere hold current to operate the damper in the 'soft' setting.

Vertical Accelerometer

Two accelerometers are used by the adaptive damping system:

- a front accelerometer attached to the bracket of the right-hand engine oil cooler,
- a rear accelerometer mounted in the luggage compartment, in the rear left-hand corner next to the rear lamp assembly.

The accelerometers measure acceleration in the vertical plane and output a corresponding analogue signal to the adaptive damping module. Each accelerometer is connected to the adaptive damping module via three wires which supply: ground, 5 volt supply and signal return.

The accelerometers are of the capacitive type. The sensing element comprises two parallel plate capacitors. The capacitors alter the peak voltage which is generated by an internal oscillator when the accelerometer is subjected to acceleration. Detection circuits within the accelerometer measure the peak voltage and pass an analogue output signal to the adaptive damping module. The accelerometers output a signal voltage of approximately $1 \text{ V/g} \pm 0.05 \text{ V/g}$.

Vehicle Dynamic Suspension - Vehicle Dynamic Suspension

Diagnosis and Testing

Principle of Operation

For a detailed description of the adaptive damping system operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: (204-05 Vehicle Dynamic Suspension)

[Vehicle Dynamic Suspension - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (Description and Operation),
[Vehicle Dynamic Suspension - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (Description and Operation),

Inspection and Verification

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Coil spring(s) ● Shock absorber(s) ● Accelerometer(s) installation ● Height sensor(s) installation 	<ul style="list-style-type: none"> ● Fuse(s) ● Wiring harness/electrical connectors ● Accelerometer(s) ● Adaptive Damping Control Module ● Height sensor(s)

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check the system for any logged Diagnostic Trouble Codes (DTCs) and refer to the DTC index.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

- NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.
- NOTE: Generic scan tools may not read the codes listed, or may read only five-digit codes. Match the five-digits from the scan tool to the first five-digits of the seven-digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).
- NOTE: When performing electrical voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.
- NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
- NOTE: Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.
- NOTE: If DTCs are logged and, after carrying out the pinpoint tests, a fault is not identified, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Ride and Handling Optimization - Ride and Handling Optimization -

Overview

Description and Operation

OVERVIEW

JaguarDrive Control is a selectable vehicle optimisation system, designed to fine-tune the driving characteristics of the vehicle by accommodating different driving conditions or driving styles. The system allows the performance envelope of the vehicle to be stretched and prevents the necessity for a single, compromised configuration for all conditions. JaguarDrive Control increases the vehicle's abilities by changing the characteristics of engine mapping, transmission shifts and stability and traction interventions. The software for the JaguarDrive control is incorporated in the JaguarDrive selector module.

- **NOTE:** The JaguarDrive Control system is a co-ordinating system only. It **CANNOT** generate a fault in one of the participating sub-systems. All participating subsystems should be **FULLY** diagnosed before assuming a fault with JaguarDrive Control. Replacing the JaguarDrive selector module should not be done until all other options have been exhausted.

Ride and Handling Optimization - Ride and Handling Optimization - System Operation and Component Description

Description and Operation

System Operation

JAGUARDRIVE CONTROL OPERATION

Engine Management System

The Engine Management System (EMS) varies the accelerator pedal maps to change the amount of torque per percentage of pedal travel. The EMS can also change the accelerator pedal response to control the allowed torque change relative to the speed of pedal travel.

Each driving mode uses a combination of operating parameters for each sub-system. Changing between driving modes initiates a different set of operating characteristics, which will be noticeable to the driver. The driver will notice differences in engine response when, for example, the accelerator pedal is held in a constant position and the driving mode is changed from Winter to Dynamic, the driver will notice the torque and engine speed increase. Similarly, if the mode is changed from Normal or Dynamic to Winter the driver will notice a reduction in torque and engine speed.

• **NOTE:** The change in torque and engine speed can take approximately 30 seconds and care must be taken not to confuse the JaguarDrive Control system operation with an EMS fault.

Transmission Control

The TCM (transmission control module) changes the shift maps for the JaguarDrive Control mode selected. This changes the shift points providing early or late upshifts and downshifts. For example, on slippery surfaces in Winter mode the transmission will select 2nd gear for starting from a standstill on a flat surface to minimize wheel slip.

Anti-lock Braking System Control

The ABS (anti-lock brake system) module controls several vehicle functions and adjusts the operating parameters of these functions to optimize the selected JaguarDrive Control mode. Traction control uses different slip/acceleration thresholds to improve traction and vehicle composure. For example, the system sensitivity is increased on slippery surfaces to reduce wheel spin.

If TracDSC is selected or DSC is switched off, then subsequently the JaguarDrive Control mode is changed, DSC is automatically switched back on (or to TracDSC for Dynamic mode).

The stability control uses different threshold values for the selected mode, reducing the requirement for the driver to change the DSC system mode for optimum performance in various driving scenarios.

Incorrect Mode Usage

Selection of an inappropriate mode is discouraged in the following ways:

- The active mode icon is continually displayed in the instrument cluster message center
- In any special mode, when the ignition has been in the off position continuously for more than 6 hours, the JaguarDrive Control system defaults to the special modes off (DSC on).

Selection of an inappropriate mode for the conditions will not endanger the driver or immediately cause damage to the vehicle. Continued use of an inappropriate mode may reduce the life of some components. The driver may notice a different vehicle response, with the engine and transmission responses being different than in the special modes off.

Driver Information

The instrument cluster contains a message center, which displays vehicle information to the driver. The message center contains the JaguarDrive Control mode icons, which display the currently selected mode. If no symbol is displayed, no special mode is selected and the system is in special modes off.

Any required changes to the subsystems are also passed to the driver in the form of warning illumination in the instrument cluster or appropriate messages in the message center, DSC off for example.

In Dynamic mode when the transmission is in manual mode, the gear information is displayed in amber when the appropriate engine speed is reached for optimum sporty change point.

DIAGNOSTICS

JaguarDrive Control relies on the correct functionality of the sub-systems. If one of the sub-systems develops a fault, the JaguarDrive Control system will not function, even though the fault is not in the JaguarDrive Control system.

The JaguarDrive Selector module and rotary control should only be investigated if there are no apparent faults in any of the sub-systems. If a fault in a sub-system is subsequently corrected, the JaguarDrive Control system will function normally after an ignition on and off cycle.

JaguarDrive Control Sub-System Faults

If a fault occurs in a sub-system, the driver is alerted by the illumination of a warning indicator and/or an appropriate message for that sub-system in the instrument cluster message center. No JaguarDrive Control message will be shown when a failed sub-system displays its own message.

When a sub-system fault is present and the driver attempts to select a different JaguarDrive Control mode or at the next ignition on cycle, a message 'WINTER MODE FAULT' or 'DYNAMIC MODE FAULT' will appear in the message center. This

generally implies that the JaguarDrive Control system has a fault, but only because a sub-system fault is preventing its operation. This message will be displayed once per ignition cycle, but is repeated if a further selection is made by the driver using the JaguarDrive Control buttons or at the next ignition on cycle.

• NOTE: The message 'WINTER MODE FAULT' or 'DYNAMIC MODE FAULT' can also in very rare circumstances be generated by a fault in the JaguarDrive Control module.

It is not possible for the JaguarDrive Control module to cause any fault behavior (warning indicator illumination or message generation) in any of the sub-systems. Illumination of a sub-system warning indicator and/or a sub-system related message will never be associated with a JaguarDrive Control module or JaguarDrive Control system fault.

The sub-system control modules can detect a fault with the CAN (controller area network) bus signal from the transmission selector module. If a fault in the JaguarDrive Control system is detected, the sub-system control modules will operate in the 'special modes off' setting. The sub-system control modules will record a fault code for a failure of the JaguarDrive Control CAN signal. These faults can be retrieved using the Jaguar approved diagnostic tool and will provide useful information to indicate investigation of the JaguarDrive Selector module or the CAN bus network.

JaguarDrive Control System or Control Module Fault

If a fault occurs in the JaguarDrive Control system, all button icon LED (light emitting diode)'s will be turned off (background illumination will remain on) and pressing of the JaguarDrive Control buttons is ignored. The instrument cluster message center will display a message 'WINTER MODE FAULT' or 'DYNAMIC MODE FAULT' when the fault occurs, if the fault is present and the driver attempts to select a special mode (if the control module is able to do this) or at the next ignition on cycle.

The JaguarDrive Control buttons and control module (JaguarDrive Selector module) are an integral unit. If a fault occurs in either component, the whole unit will require replacement, however, this is extremely unlikely.

CAN Bus Faults

If a CAN bus fault exists and prevents JaguarDrive Control system operation, all of the JaguarDrive Control button icon LED's will be illuminated and rotation pressing of the JaguarDrive Control buttons is ignored.

If the instrument cluster does not receive a JaguarDrive Control system CAN bus message from the JaguarDrive Control module, the message 'SPECIAL MODE UNAVAILABLE' will be displayed when the fault occurs and will be repeated at every ignition on cycle.

User Error

A special mode change while DSC or ABS is active (this includes ABS cycling) may be misinterpreted as a system fault.

Component Description

JAGUARDRIVE CONTROL DESCRIPTION

JAGUARDRIVE CONTROLS

E98438

ItemDescription

1	Winter mode button
2	DSC/TracDSC mode button
3	ASL (automatic speed limiter) - Reference only, not part of JaguarDrive system
4	Dynamic mode (Supercharged models only)

The system is controlled by buttons adjacent to the JaguarDrive Selector located on the floor console. The buttons allow the selection of one of the following 3 modes:

- Special modes off
- Winter mode
- Dynamic mode (Supercharged models only).

The instrument cluster will display the selected JaguarDrive Control mode in the message center.

The JaguarDrive Control system uses a combination of a number of vehicle sub-systems to achieve the required vehicle characteristics for the mode selected. The following sub-systems make up the JaguarDrive Control system:

- The Engine Management System (EMS)
- Automatic transmission
- Brake system.

The JaguarDrive Control software is stored in the JaguarDrive Selector module located below the JaguarDrive selector. The module detects the selection made using the buttons and transmits a signal on the high speed [CAN](#) bus, which is received by each of the sub-system control modules.

Each of the affected sub-system control modules contain software, which applies the correct operating parameters to their controlled system for the JaguarDrive Control mode selection made.

Each sub-system control module also provides a feedback for the selected mode so that the JaguarDrive Control software can check that all systems have changed to the correct operating parameters.

• **NOTE:** The JaguarDrive Control system is a co-ordinating system only. It CANNOT generate a fault in one of the participating sub-systems. All participating sub-systems should be FULLY diagnosed before assuming a fault with JaguarDrive Control. Replacing the JaguarDrive Selector module should not be done until all other options have been exhausted.

Winter Mode

To activate winter mode, press the winter mode button briefly (not less than 300 ms) to activate or de-activate the mode.

• **NOTE:** Winter mode cannot be active at the same time as dynamic mode (Supercharged models only).

When active the winter mode icon and message appear in the instrument cluster message center to confirm the activation.

Dynamic Stability Control (DSC)

Press the DSC mode button briefly (not less than 300 ms) to switch between DSC and TracDSC. The instrument cluster message center will display either 'DSC ON' or 'TRAC DSC' depending on which selection is made. When TracDSC is selected, the DSC warning lamp in the instrument cluster is illuminated and the DSC button is illuminated.

DSC can be manually switched off by pressing the DSC mode button for more than 10 seconds. Confirmation is given by a chime from the instrument cluster, 'DSC OFF' is displayed in the instrument cluster message center and the DSC warning lamp in the instrument cluster is illuminated.

• **NOTE:** DSC is operational at all times when the engine is running unless manually switched off.

Dynamic Mode (Supercharged models only)

To activate Dynamic mode, press the button briefly. The dynamic mode and DSC buttons are illuminated. 'Dynamic Mode Confirmed' message is displayed in the instrument cluster message center and the DSC off warning lamp in the instrument cluster is illuminated (due to automatic selection of TracDSC in Dynamic mode).

• **NOTE:** Dynamic mode cannot be active at the same time as winter mode.

Once activated, TracDSC is automatically selected. In gearbox Sport mode, the driver has full control over the transmission shift points and the [TCM](#) will not intervene to prevent engine overspeed (for example; upshifts are inhibited in gearbox sport mode when Dynamic mode is selected). In this setting, the gear indicator in the instrument cluster will turn amber at high rev's to indicate an appropriate manual upshift point.

Driveline System - General Information - Driveline System

Diagnosis and Testing

Principle of Operation

For a detailed description of driveline operation, refer to the relevant Description and Operation section in the workshop manual. REFER to:

[Driveshaft](#) (205-01 Driveshaft, Description and Operation),

[Rear Drive Halfshafts](#) (205-05 Rear Drive Halfshafts, Description and Operation),
[Rear Drive Halfshafts](#) (205-05 Rear Drive Halfshafts, Description and Operation).

Inspection and Verification

CAUTION: Only serviceable items can be renewed or adjusted. Failure to follow this instruction may result in the warranty of the component being rejected.

Certain driveline trouble symptoms are also common to the engine, transmission, wheel bearings, tires, and other parts of the vehicle. For this reason, make sure that the cause of the trouble is in the driveline before adjusting, repairing, or installing any new components. For additional information, refer to Workshop Manual section 100-04 Noise, Vibration and Harshness.

1. **1.** Verify the customer concern by carrying out a road test of the vehicle.
2. **2.** Visually inspect for obvious signs of mechanical damage and system integrity.
3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.

Identify the Condition

Gear Howl and Whine

Howling or whining of the ring gear and pinion is due to an incorrect gear pattern, gear damage or incorrect bearing preload.

Bearing Whine

Bearing whine is a high-pitched sound similar to a whistle. It is usually caused by worn/damaged pinion bearings, which are operating at driveshaft speed. Bearing noise occurs at all driving speeds. This distinguishes it from gear whine which is speed dependent.

ELE0012864

As noted, pinion bearings make a high-pitched, whistling noise, usually at all speeds. If however there is only one pinion bearing that is worn/damaged, the noise may vary in different driving phases.

A wheel bearing noise can be mistaken for a pinion bearing noise.

Chuckle

Chuckle that occurs on the coast driving phase is usually caused by excessive clearance between the differential gear hub and the differential case bore.

Damage to a gear tooth on the coast side can cause a noise identical to a chuckle. A very small tooth nick or ridge on the edge of a tooth can cause the noise.

ELE0012866

Knock

Knock, which can occur on all driving phases, has several causes including damaged teeth or gearset.

ELE0012867

A gear tooth damaged on the drive side is a common cause of the knock.

ELE0012868

Clunk

Clunk is a metallic noise heard when the automatic transmission is engaged in REVERSE or DRIVE. The noise may also

occur when the throttle is applied or released. Clunk is caused by transmission calibration, backlash in the driveline or loose suspension components and is felt or heard in the vicinity of the rear drive axle.

Bearing Rumble

Bearing rumble sounds like marbles being tumbled. This condition is usually caused by a worn/damaged wheel bearing. The lower pitch is because the wheel bearing turns at only about one-third of the driveshaft speed. Wheel bearing noise also may be high-pitched, similar to gear noise, but will be evident in all four driving modes.

Symptom Chart

Symptom	Possible Cause	Action
Noise is at constant tone over a narrow vehicle speed range. Usually heard on light drive and coast conditions	<ul style="list-style-type: none"> Rear drive axle 	<ul style="list-style-type: none"> For additional information, GO to Pinpoint Test A.

Description and Operation

Driveshaft Overview

The two-piece driveshaft, manufactured from lightweight tubular steel, transmits drive from the engine, via the transmission, to the differential. The driveshaft aligns with the centerline of the vehicle's body and is supported by a center bearing.

Driveshaft - Driveshaft - System Operation and Component Description

Description and Operation

System Operation

Driveshaft

The two-piece driveshaft, manufactured from lightweight tubular steel, transmits drive from the engine, via the transmission, to the differential. The driveshaft aligns with the centerline of the vehicle's body and is supported by a center bearing.

The driveshaft's front tube is of swaged construction, which is a crash energy management feature, designed to collapse progressively and predictably in the event of a severe frontal impact. A low-friction splined slip-joint at the center of the driveshaft provide the driveshaft's plunge capability.

Flexible couplings connecting the driveshaft to both the transmission and the differential counteract the angular movement of the driveshaft caused by the driveline's acceleration and braking forces.

The center universal joint is positioned at a specified angle using shims between the center bearing and the vehicle's body. The driveline angles have been carefully configured to balance minimum power losses with excellent vibration and wear characteristics. The universal joint is lubricated during manufacture and sealed for life.

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Refer to: Exhaust System (309-00A, Removal and Installation).

3.
 - Torque: 9 Nm

4. **4. CAUTIONS:**

 Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft.

 Make sure that the driveshaft is supported with suitable retaining straps.

- Mark the position of the driveshaft flange in relation to the output flange.
- Torque: 127 Nm

E98780

E98781

5. 5. CAUTIONS:

 Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft.

 Make sure that the driveshaft is supported with suitable retaining straps.

- Mark the position of the driveshaft in relation to the rear drive axle flange.
- Mark the position of the balance nut (if fitted) in relation to the flexible coupling.
- *Torque:* 108 Nm

6.  **WARNING:** This step requires the aid of another technician.

• **NOTE:** Note the fitted position of the spacers.

- *Torque:* 88 Nm

Installation

1. **1. NOTE:** Make sure that these components are installed to the noted removal position.

To install, reverse the removal procedure.

Description and Operation

Component Location

ItemDescription

1	Differential
---	--------------

Rear Drive Axle/Differential - Rear Drive Axle and Differential 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Overview

Description and Operation

Differential

The differential's purpose is to compensate for discrepancies in the rotation rates of the vehicle's drive wheels during cornering.

Rear Drive Axle/Differential - Rear Drive Axle and Differential 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - System Operation and Component Description

Description and Operation

System Operation

Differential

The differential's pinion shaft aligns with the centerline of the vehicle's body and is supported by two taper-roller bearings.

The pinion shaft receives power from the engine through the transmission and driveshaft. The pinion shaft gear rotates the differential ring gear, which is bolted to the differential housing outer flange. Inside the differential housing, two differential pinion gears are mounted on a differential shaft, which is pinned to the differential housing. These pinion gears are engaged with the differential side gears to which the halfshafts are splined. As the differential side gears turn, they rotate the halfshafts and rear wheels.

When it is necessary for one wheel and halfshaft to rotate faster than the other, the faster turning differential side gear causes the differential pinion gears to roll on the slower turning differential side gear. This allows differential action between the two halfshafts.

Component Description

Differential

The differential is supported at three mounting points, one at the front of the unit, and two at the rear, through rubber bushes to the vehicle's rear subframe. This mounting arrangement plus the subframe to vehicle-body mounting arrangement provides the rear driveline with double isolation from the vehicle's body.

The main casing of the differential is constructed of lightweight cast-iron with an aluminum rear cover. The rear cover incorporates fins to aid air cooling of the differential unit.

Rear Drive Halfshafts - Rear Drive Halfshafts - Overview

Description and Operation

Overview

The CV (constant velocity) joint at each end of the halfshafts meets the angle change requirements due to suspension deflection. The plunge capability of the CV joint accommodates the length change.

Rear Drive Halfshafts - Rear Drive Halfshafts - System Operation and Component Description

Description and Operation

System Operation

Component Description

Rear Drive Halfshafts

The solid-steel halfshafts are of unequal length, with each halfshaft comprising inner and outer CV (constant velocity) joints. The CV joints are the 'ball and socket' type packed with grease and protected by gaiters.

The outer CV joint is an interference fit into the wheel hub and secured by a locking nut. The inner CV joint is a slide fit and is retained in the differential with a spring clip.

Removal

- 
WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Loosen the wheel hub nut.

VUJ0004084

3. Remove the brake disc.

For additional information, refer to: [Brake Disc](#) (206-04 Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

4.  CAUTION: Note the fitted position of the component prior to removal.

Detach the anti-lock brake system (ABS) sensor.

E94129

5. Detach the outer tie rod.

E31065

6. Detach the lower arm from the wheel knuckle.

7. Remove the wheel hub nut.

8. Using the special tools, detach the rear halfshaft.

9. **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Remove the wheel knuckle assembly.

10. **⚠ CAUTION:** To avoid damage to the halfshaft constant velocity (CV) joints and boots, do not allow the CV joints to exceed 18 degrees of travel.

• **NOTE:** The halfshaft is retained in the axle assembly by a retaining clip.

Using the special tools, remove the rear halfshaft.

- Remove and discard the retaining clip.

11. Remove the halfshaft seal.

Installation

1.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

Using the special tool, install the halfshaft seal.

2. Install a new retaining clip.

3.  CAUTION: The next four steps must be carried out within 5 minutes of applying the sealant.

Apply a 3mm diameter bead of Loctite 648 or equivalent meeting Jaguar specification to the halfshaft.

E49923

4. CAUTIONS:

 To avoid damage to the halfshaft constant velocity (CV) joints and boots, do not allow the CV joints to exceed 18 degrees of travel.

 Make sure no damage occurs to the halfshaft seal when installing the halfshaft.

• NOTE: Do not fully engage the halfshaft into the axle assembly.

Install the halfshaft.

- Install the special tool to the rear halfshaft seal.
- Install the halfshaft.

5. Remove the special tool.

VUJ0002035

VUJ0002036

6. CAUTIONS:

 To avoid damage to the halfshaft constant velocity (CV) joints and boots, do not allow the CV joints to exceed 18 degrees of travel.

 Make sure no damage occurs to the halfshaft seal when installing the halfshaft.

• NOTE: Make sure the retaining clip is correctly seated.

Attach the rear halfshaft.

7.  CAUTION: Axle fluid should flow from the filler plug threaded hole when full. Failure to follow this instruction may result in damage to the axle.

• NOTE: Install a new fluid level filler plug.

Check and top up the axle assembly fluid level as required.

- Tighten to 34 Nm.

VUJ0000397

8. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Install the wheel knuckle assembly.

E 31644

9. NOTE: Using the old wheel hub nut, tighten to 150 Nm.

• **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Attach the wheel knuckle to the rear halfshaft.

E31066

10. Install the lower arm to the wheel knuckle.

E31065

11. Install the outer tie rod retaining nut.

12. Install the ABS sensor.

- Tighten to 6 Nm.

E94129

13. Install the brake disc.

For additional information, refer to: [Brake Disc](#) (206-04 Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

14. Remove and discard the old wheel hub nut, install a new wheel hub nut.

- Tighten to 300 Nm.

VUJ0004084

15.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

Tighten to 150 Nm.

E31066

16.  CAUTION: The final tightening of the suspension components must be carried out with the vehicle on its wheels.

Tighten to 55 Nm.

Rear Drive Halfshafts - Inner Constant Velocity (CV) Joint Boot

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the rear halfshaft.
For additional information, refer to: Rear Halfshaft - 5.0L/3.0L Diesel (205-05, Removal and Installation).

3.  **CAUTION:** Use suitable protective covers to protect the halfshaft.

Using a suitable clamp, secure the rear halfshaft.

4.  **CAUTION:** Make sure the inner constant velocity (CV) joint is not separated from the halfshaft.

Remove and discard the inner CV joint boot retaining clip.

5.  **CAUTION:** Make sure the CV joint ball bearings do not drop out of the CV joint.

Using a suitable tool, remove the inner CV joint.

6. Remove the inner CV joint boot.

- Remove and discard the retaining clip.

Installation

1. NOTE: Make sure that the protective sleeve is correctly installed, prior to installing the CV joint boot.

2. NOTE: Install a new retaining clip.

E118563

3. CAUTIONS:

- ⚠ Only use lubricants meeting the Jaguar specification.
- ⚠ Make sure the CV joint ball bearings do not drop out of the CV joint.

• NOTE: Clean the constant velocity (CV) joint, removing as much of the old grease as possible.

Install the inner CV joint.

- Fill the CV joint with 40 grams of grease.
- Fill the CV joint boot with 100 grams of grease.

E100446

4. CAUTIONS:

- ⚠ Make sure the CV joint is not separated from the halfshaft.
- ⚠ Make sure enough air is present in the CV boot.

Install a new retaining clip.

5. Install a new retaining clip.

E100449

6. Remove the rear halfshaft from the clamp.

7. Install the rear halfshaft.

For additional information, refer to: Rear Halfshaft - 5.0L/3.0L Diesel (205-05, Removal and Installation).

Rear Drive Halfshafts - Outer Constant Velocity (CV) Joint Boot

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- 2.
3. For additional information, refer to: [Inner Constant Velocity \(CV\) Joint Boot](#) (205-05 Rear Drive Halfshafts, Removal and Installation).
- 4.

E118528

- 5.

E118524

6.  **CAUTION:** Make sure the CV joint ball bearings do not drop out of the CV joint.

• **NOTE:** Clean the constant velocity (CV) joint, removing as much of the old grease as possible.

Installation

1.  CAUTION: Only use lubricants meeting the Jaguar specification.

• NOTE: Make sure that the protective sleeve is correctly installed, prior to installing the CV joint boot.

- Fill the CV joint with 50 grams of grease.
- Fill the CV joint boot with 85 grams of grease.

E118459

2.  CAUTION: Make sure enough air is present in the CV boot.

• NOTE: Install new retaining clips.

E118528

Brake System - General Information -

Lubricants, Fluids, Sealers and Adhesives

CAUTION: Do not use brake fluid ITT Super Dot 4 on 2006my vehicles onwards. Failure to follow this instruction may result in damage to the vehicle.

• **NOTE:** Brake fluid ITT Super Dot 4 has now been superseded by Shell ESL Super Dot 4 which is the Jaguar recommended brake fluid. Shell ESL Super Dot 4 can be used on all model years.

New rear brake disc nominal thickness - All Vehicles	20 mm (0.8 in)
Worn rear brake disc minimum thickness - All Vehicles	18 mm (0.71 in)
Maximum front brake disc runout (installed) - All Vehicles	0.09 mm (0.003 in)
Maximum rear brake disc runout (installed) - All Vehicles	0.075 mm (0.003 in)
Maximum front hub face runout (installed)	0.015 mm (0.006 in)
Maximum rear hub face runout (installed)	0.05 mm (0.02 in)
Front brake caliper piston diameter - All Vehicles	60 mm (2.36 in)
Rear brake caliper piston diameter - All Vehicles	45 mm (1.77 in)

Brake System - General Information - Brake System

Diagnosis and Testing

Principle of Operation

For a detailed description of the brake system, refer to the relevant Description and Operation sections in the workshop manual. REFER to:

 Brake Booster (206-07, Description and Operation).

Inspection and Verification

Visually examine the front and rear wheel and tire assemblies for damage such as uneven wear patterns, tread worn out or sidewall damage. Verify the tires are the same size, type and, where possible, same manufacturer. Replace the damaged wheel or excessively worn tire.

Wheels and tires must be cleared of any foreign matter and tire pressures adjusted to the correct specification.

If the tires exhibit uneven wear or feathering, the cause must be corrected. Check the steering and suspension components for damage or wear and, if necessary, check and adjust front wheel alignment. REFER to: (204-00 Suspension System - General Information)

[Specifications](#) (Specifications),
[Front Toe Adjustment](#) (General Procedures).

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Brake master cylinder ● Brake caliper piston(s) ● Brake discs ● Wheel bearings ● Brake pads ● Power brake booster ● Brake pedal linkage ● Brake booster vacuum hose ● Tires ● Debris 	<ul style="list-style-type: none"> ● Parking brake actuator ● Parking brake module ● Parking brake switch ● Damaged or corroded wiring harness ● Brake master cylinder fluid level switch

Road Test

Carry out a road test to compare actual vehicle braking performance with the performance standards expected by the driver. The ability of the test driver to make valid comparisons and detect performance deficiencies will depend on experience.

The driver should have a thorough knowledge of brake system operation and accepted general performance guidelines to make good comparisons and detect performance concerns.

An experienced brake technician will always establish a route that will be used for all brake diagnosis road tests. The roads selected will be reasonably smooth and level. Gravel or bumpy roads are not suitable because the surface does not allow the tires to grip the road equally. Crowned roads should be avoided because of the large amount of weight shifted to the low set of wheels on this type of road. Once the route is established and consistently used, the road surface variable can be eliminated from the test results.

Before a road test, obtain a complete description of the customer concerns or suspected condition. From the description, the technician's experience will allow the technician to match possible causes with symptoms. Certain components will be tagged as possible suspects while others will be eliminated by the evidence. More importantly, the customer description can reveal unsafe conditions which should be checked or corrected before the road test. The description will also help form the basic approach to the road test by narrowing the concern to specific components, vehicle speed or conditions.

Begin the road test with a general brake performance check. Keeping the description of the concern in mind, test the brakes at different vehicle speeds using both light and heavy pedal pressure. To determine if the concern is in the front or rear braking system, use the brake pedal and then use the parking brake control. If the condition (pull, vibration, pulsation) occurs only with the parking brake, the concern is in the rear brake system.

If the concern becomes evident during this check, verify it fits the description given before the road test. If the concern is

not evident, attempt to duplicate the condition using the information from the description.

If a concern exists, use the Symptom Chart in order to isolate it to a specific sub-system and condition description. From this description, a list of possible sources can be used to further narrow the cause to a specific component or condition.

Symptom Chart

Symptom	Possible Cause	Action
Brakes noisy	<ul style="list-style-type: none"> ● Brake pads ● Brake discs 	GO to Pinpoint Test A.
Vibration when brakes are applied	<ul style="list-style-type: none"> ● Wheels/tires out of balance ● Wheel hub nuts loose ● Brake caliper mounting bolts loose ● Brake pads ● Foreign material/scratches/corrosion on brake disc contact surfaces ● Excessive brake disc thickness variation ● Excessive brake disc runout ● Wheel bearing wear or failure ● Suspension bushing wear or failure ● Steering bushing wear or failure 	GO to Pinpoint Test B.
The brakes pull or drift	<ul style="list-style-type: none"> ● Tire pressures/wear ● Brake calipers ● Brake pads ● Brake discs ● Wheel alignment adjustment ● Wheel bearing ● Suspension bushings and ball joints 	GO to Pinpoint Test C.
The pedal feels spongy	<ul style="list-style-type: none"> ● Air in brake hydraulic system ● Leak in hydraulic system ● Brake booster/master cylinder ● Brake pads 	GO to Pinpoint Test D.
The pedal goes down fast	<ul style="list-style-type: none"> ● Air in brake hydraulic system ● Leak in hydraulic system ● Brake booster/master cylinder ● Brake pads 	GO to Pinpoint Test E.
The pedal goes down slowly	<ul style="list-style-type: none"> ● Air in brake hydraulic system ● Brake booster/master cylinder 	GO to Pinpoint Test F.
Excessive brake pedal effort required	<ul style="list-style-type: none"> ● Brake pads ● Brake booster 	GO to Pinpoint Test G.
Brake lockup during light brake pedal force	<ul style="list-style-type: none"> ● Brake pads ● Brake calipers 	GO to Pinpoint Test H.
Brakes drag	<ul style="list-style-type: none"> ● Parking brake control applied/malfunction ● Seized parking brake cables ● Seized brake caliper slide pins ● Seized brake caliper ● Brake booster ● Pedal gear 	GO to Pinpoint Test I.
Excessive/Erratic brake pedal travel	<ul style="list-style-type: none"> ● Hydraulic system ● Brake pads ● Brake discs ● Hub and bearing assembly 	GO to Pinpoint Test J.
The red brake warning indicator is always on	<ul style="list-style-type: none"> ● Fluid level ● Brake master cylinder fluid level sensor ● Parking brake control ● Electrical circuit 	Fill the system to specification. Check for leaks. Install a new brake master cylinder fluid reservoir as required. REFER to: Brake Fluid Reservoir (206-06 Hydraulic Brake Actuation, Removal and Installation). For parking brake control and circuit tests. REFER to: Parking Brake (206-05 Parking Brake and Actuation, Diagnosis and Testing).
Slow or incomplete brake pedal return	<ul style="list-style-type: none"> ● Brake pedal binding ● Brake booster/master cylinder 	GO to Pinpoint Test K.

Pinpoint Tests

PINPOINT TEST A : BRAKES NOISY	
TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: INSPECT BRAKE PADS	
1	Inspect the condition of the front and rear brake pads. Check for damage to any anti-squeal shims.

	<p>Are the brake pads OK?</p> <p>Yes GO to A2.</p> <p>No Clean/install new front and rear brake pads as required. REFER to: Brake Pads - Vehicles With: Standard Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Pads - Vehicles With: High Performance Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Pads (206-04 Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Pads - Vehicles With: High Performance Brakes (206-04, Removal and Installation). Re-test vehicle for brake noise.</p>
--	---

A2: INSPECT BRAKE DISCS

	<p>1 Inspect the brake discs for excessive corrosion, wear or disc thickness variation.</p>
	<p>Does excessive corrosion, wear or disc thickness variation exist?</p> <p>Yes Install new front and rear brake discs and brake pads as required. REFER to: Brake Pads - Vehicles With: Standard Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Pads - Vehicles With: High Performance Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Pads (206-04 Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Pads - Vehicles With: High Performance Brakes (206-04, Removal and Installation), Brake Disc - Vehicles With: Standard Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Disc - Vehicles With: High Performance Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Disc - Vehicles With: High Performance Brakes (206-04, Removal and Installation). Re-test vehicle for brake noise.</p> <p>No No action required, vehicle is OK.</p>

PINPOINT TEST B : VIBRATION WHEN BRAKES ARE APPLIED

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: ROAD TEST VEHICLE	
	<p>1 Road test the vehicle between 40-80 km/h (25-50 mph) without applying brakes.</p>
	<p>Is the vibration present?</p> <p>Yes For noise vibration and harshness tests. REFER to: Noise, Vibration and Harshness (NVH) (100-04 Noise, Vibration and Harshness, Diagnosis and Testing).</p> <p>No GO to B2.</p>
B2: CHECK FOR BRAKE VIBRATION	
	<p>1 Road test the vehicle between 40-80 km/h (25-50 mph) with light and medium application on the brake pedal.</p>
	<p>Is a vibration present?</p> <p>Yes Check the brake caliper mounting bolts and wheel hub nuts and tighten to specification as required. Check the balance of all road wheels and tires and repair as required. Check the brake discs for excessive wear, runout, thickness variation or cracks. Install new brake discs and brake pads as required. GO to B3.</p> <p>No No action required, vehicle is OK.</p>
B3: IS VIBRATION STILL PRESENT UNDER BRAKE APPLICATION?	
	<p>1 Road test the vehicle between 40-80 km/h (25-50 mph) with light and medium application on the brake pedal.</p>
	<p>Is a vibration present?</p> <p>Yes Check for wear or failure of steering gear bushings. Check for wear or failure of steering gear ball joints. Check for wear or failure of front wheel bearings, suspension bushings and ball joints. Check for wear or failure of rear wheel bearings, suspension bushings and ball joints. Refer to relevant section in workshop manual and install new components as required.</p> <p>No No action required, vehicle is OK.</p>

PINPOINT TEST C : THE BRAKES PULL OR DRIFT

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: ROAD TEST VEHICLE	
	<p>1 Road test the vehicle and apply the brake pedal.</p>
	<p>Does the vehicle pull or drift?</p> <p>Yes GO to C2.</p> <p>No No action required, vehicle is OK.</p>
C2: INSPECT TIRE CONDITION/PRESSURE	

	1 Check for excessive tire wear or incorrect pressures.
Are the tires at the correct pressure and in good condition?	
Yes	GO to C3.
No	Adjust the tire pressures or install new tires if excessively worn. Re-test the system for normal operation.

C3: CHECK CALIPERS

	1 Check the disc brake caliper pistons and pins for binding, leaking or sticking.
Do the disc brake caliper pistons and pins bind, leak or stick?	
Yes	Rectify sticking pins and install new brake calipers as required. REFER to: Brake Caliper - Vehicles With: Standard Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Caliper - Vehicles With: High Performance Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Caliper (206-04 Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Caliper - Vehicles With: High Performance Brakes (206-04, Removal and Installation). Re-test the system for normal operation.
No	GO to C4.

C4: INSPECT BRAKE DISCS

	1 Check the brake discs for excessive damage, thickness variation or runout. REFER to: Brake Disc Runout Check (206-00 Brake System - General Information, General Procedures).
Does excessive damage or runout exist?	
Yes	Install new brake discs and brake pads as required. Re-test the system for normal operation.
No	GO to C5.

C5: INSPECT THE FRONT HUB AND WHEEL BEARING ASSEMBLY

	1 Check the front hub and wheel bearing assembly.
Are the wheel bearings OK?	
Yes	GO to C6.
No	Install new wheel bearings as required. REFER to: Front Wheel Bearing and Wheel Hub (204-01 Front Suspension, Removal and Installation). Re-test the system for normal operation.

C6: CHECK SUSPENSION BUSHINGS AND BALL JOINTS.

	1 Check all suspension bushings and ball joints.
Are the suspension bushings and ball joints OK?	
Yes	GO to C7.
No	Install new front suspension bushings and ball joints as required. Install new rear suspension bushings and ball joints as required. Refer to the relevant section in the workshop manual.

C7: CHECK VEHICLE ALIGNMENT

	1 Check the vehicle alignment. REFER to: Front Subframe - 2.7L Diesel (502-00, Removal and Installation), Front Subframe - 3.0L (502-00, Removal and Installation), Front Subframe - 4.2L SC V8 - AJV8 (502-00 Uni-Body, Subframe and Mounting System, Removal and Installation).
Is the alignment within specification?	
Yes	No action is required, vehicle is OK.
No	Adjust the alignment as required. REFER to: Front Subframe - 2.7L Diesel (502-00, Removal and Installation), Front Subframe - 3.0L (502-00, Removal and Installation), Front Subframe - 4.2L SC V8 - AJV8 (502-00 Uni-Body, Subframe and Mounting System, Removal and Installation).

PINPOINT TEST D : THE PEDAL FEELS SPONGY

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: CHECK FOR SPONGY PEDAL (ENGINE OFF)	
	1 Check for a firm brake pedal.
Is the brake pedal effort and brake pedal travel normal?	
Yes	No action is required, vehicle is OK.
No	GO to D2.
D2: CHECK BRAKE PEDAL RESERVE (ENGINE OFF)	
	1 Pump the brake pedal 10 times and hold on the final application.
Does the brake pedal feel firm on final application?	
Yes	GO to D3.
No	Bleed the brake system.

	REFER to: Brake System Bleeding (206-00 Brake System - General Information, General Procedures).
D3: CHECK BRAKE PEDAL RESERVE (ENGINE ON)	
	1 With engine running at idle speed.
	2 Apply the brake pedal lightly three or four times.
	3 Wait 15 seconds for the vacuum to recover.
	4 Push down on the brake pedal until it stops moving downward or an increased resistance to the brake pedal travel occurs.
	5 Hold the brake pedal in the applied position while increasing the engine speed to 2000 revs/min.
	6 Release the accelerator pedal.
	Does the brake pedal move downward as the engine speed returns to idle? Yes GO to D4. No Check the vacuum to brake booster.
D4: CHECK BRAKE FLUID LEVEL	
	1 Check the brake master cylinder reservoir fluid level.
	Is the fluid level OK? Yes Bleed the brake system. REFER to: Brake System Bleeding (206-00 Brake System - General Information, General Procedures). Re-test the system for normal operation. No Check for leaking brake system and rectify as required. Add fluid and bleed the brake system. REFER to: Brake System Bleeding (206-00 Brake System - General Information, General Procedures). Re-test the system for normal operation.

PINPOINT TEST E : THE PEDAL GOES DOWN FAST

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
E1: ROAD TEST VEHICLE	
	1 Road test the vehicle and apply the brake pedal.
	Is the brake pedal effort and brake pedal travel normal? Yes No action required, vehicle is OK. No GO to E2.
E2: CHECK BRAKE PEDAL TRAVEL-PRESSURIZE SYSTEM	
	1 Pump the brake pedal rapidly (five times).
	Does the brake pedal travel build up and then hold? Yes Bleed the brake system. REFER to: Brake System Bleeding (206-00 Brake System - General Information, General Procedures). Re-test the system for normal operation. No GO to E3.
E3: CHECK FOR BRAKE SYSTEM LEAKS	
	1 Check for external brake system leaks. For additional information, refer to brake master cylinder component test in this section.
	Is there a leak present? Yes Repair as necessary, add fluid and bleed brake system. REFER to: Brake System Bleeding (206-00 Brake System - General Information, General Procedures). Re-test the system for normal operation. No No action required, system is OK.

PINPOINT TEST F : THE PEDAL GOES DOWN SLOWLY

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
F1: ROAD TEST VEHICLE - CHECK BRAKE PEDAL OPERATION	
	1 Check if the condition occurs during actual stopping application by applying the brake pedal while the vehicle is moving.
	Does the condition occur when the vehicle is moving? Yes GO to F2. No GO to F3.
F2: CHECK FOR BRAKE SYSTEM LEAKS	
	1 Check for external brake system leaks. For additional information, refer to brake master cylinder component test in this section.
	Are there any external brake system leaks? Yes Rectify as necessary. Add fluid and bleed the brake system. REFER to: Brake System Bleeding (206-00 Brake System - General Information, General Procedures).

	<p>Re-test the system for normal operation.</p> <p>No GO to F3.</p>
F3: CARRY OUT A BRAKE MASTER CYLINDER BYPASS TEST	
	<p>1 Test for brake master cylinder bypass condition. Refer to Brake master cylinder component test in this section.</p>
	<p>Has a concern been identified?</p> <p>Yes Install a new brake master cylinder, add fluid and bleed the brake system. REFER to: Brake System Bleeding (206-00 Brake System - General Information, General Procedures). Re-test the system for normal operation.</p> <p>No No action required, system is OK.</p>

PINPOINT TEST G : EXCESSIVE BRAKE PEDAL EFFORT

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

G1: CHECK BRAKE PADS

	<p>1 Check the brake pads for wear, contamination, correct installation, damage and type.</p>
	<p>Has a concern been identified?</p> <p>Yes Correctly install or install new brake pads as required. REFER to: Brake Pads - Vehicles With: Standard Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Pads - Vehicles With: High Performance Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Pads (206-04 Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Pads - Vehicles With: High Performance Brakes (206-04, Removal and Installation). Re-test the system for normal operation.</p> <p>No GO to G2.</p>

G2: CHECK VACUUM

	<p>1 Disconnect the vacuum hose from the brake booster.</p> <p>2 Connect a vacuum/pressure tester to the vacuum hose.</p> <p>3 Run the engine at normal operating temperature.</p> <p>4 Record the vacuum reading.</p>
	<p>Is the reading 40.5 kPa (12 in-Hg) or greater?</p> <p>Yes GO to G3.</p> <p>No Locate and rectify the source of low vacuum. Re-test the system for normal operation.</p>

G3: INSPECT SYSTEM

	<p>1 Switch the engine off.</p> <p>2 Reconnect the vacuum hose.</p> <p>3 Inspect the brake booster, rubber grommet, and all vacuum plumbing for cracks, holes, damaged connections, or missing clamps.</p> <p>4 Pump the brake pedal several times to exhaust the vacuum. Push down on the brake pedal and hold.</p>
	<p>Does the brake pedal move down when the engine is started?</p> <p>Yes Vacuum system is OK.</p> <p>No GO to G4.</p>

G4: CHECK POWER BRAKE BOOSTER VALVE

	<p>1 Check the brake booster valve. For additional information, refer to Brake Booster component test in this section.</p>
	<p>Is the power brake booster valve OK?</p> <p>Yes Check the brake booster. For additional information, refer to Brake Booster component test in this section. Install a new brake booster as required. REFER to: Brake Booster (206-07 Power Brake Actuation, Removal and Installation), Brake Booster - RHD (206-07, Removal and Installation). Re-test the system for normal operation.</p> <p>No Install a new brake booster valve. Re-test the system for normal operation.</p>

PINPOINT TEST H : BRAKE LOCKUP DURING LIGHT BRAKE PEDAL FORCE

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

H1: TEST BRAKE LOCKUP

	<p>1 Road test the vehicle and apply the brake pedal lightly.</p>
	<p>Do the brakes lockup?</p> <p>Yes GO to H2.</p> <p>No No action required, vehicle is OK.</p>

H2: INSPECT BRAKE PADS

	<p>1 Inspect brake pads for contamination, correct installation, damage and type.</p>
--	--

	<p>Has a concern been identified?</p> <p>Yes</p> <p>Correctly install or install new brake pads as required. REFER to: Brake Pads - Vehicles With: Standard Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Pads - Vehicles With: High Performance Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Pads (206-04 Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Pads - Vehicles With: High Performance Brakes (206-04, Removal and Installation).</p> <p>No</p> <p>Re-test the system for normal operation.</p> <p>GO to H3.</p>
--	---

H3: INSPECT BRAKE CALIPERS

	<p>1 Inspect brake calipers for binding, leaking or sticking.</p>
	<p>Has a concern been identified?</p> <p>Yes</p> <p>Correctly install or install new brake calipers as required. REFER to: Brake Caliper - Vehicles With: Standard Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Caliper - Vehicles With: High Performance Brakes (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Caliper (206-04 Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation), Brake Caliper - Vehicles With: High Performance Brakes (206-04, Removal and Installation).</p> <p>No</p> <p>Re-test the system for normal operation.</p> <p>No action required, vehicle is OK.</p>

PINPOINT TEST I : BRAKES DRAG

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
I1: ROAD TEST VEHICLE	
	<p>1 Road test the vehicle and apply the brakes.</p>
	<p>Are the brakes functioning correctly?</p> <p>Yes</p> <p>No action required, vehicle is OK.</p> <p>No</p> <p>GO to I2.</p>
I2: CHECK BRAKE CALIPERS	
	<p>1 Check the front and rear calipers pistons and pins for binding, leaking or sticking.</p>
	<p>Do the disc brake caliper pistons and pins bind, leak or stick?</p> <p>Yes</p> <p>Inspect the brake calipers and parking brake cables. Install new components as required. Re-test the system for normal operation.</p> <p>No</p> <p>GO to I3.</p>
I3: CHECK BRAKE BOOSTER	
	<p>1 Check the brake booster connecting rod alignment and travel.</p>
	<p>Is the connecting rod OK?</p> <p>Yes</p> <p>Vehicle is OK.</p> <p>No</p> <p>Install a new brake booster as required. REFER to: Brake Booster (206-07 Power Brake Actuation, Removal and Installation), Brake Booster - RHD (206-07, Removal and Installation).</p> <p>Re-test the system for normal operation.</p>

PINPOINT TEST J : EXCESSIVE/ERRATIC BRAKE PEDAL TRAVEL

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
J1: TEST ON ROUGH ROAD	
	<p>1 Road test the vehicle on rough road conditions.</p> <p>2 Apply the brakes slowly.</p>
	<p>Is the brake pedal effort and brake pedal travel normal?</p> <p>Yes</p> <p>No action required, vehicle is OK.</p> <p>No</p> <p>GO to J2.</p>
J2: CHECK BRAKE FLUID LEVEL	
	<p>1 Check the brake master cylinder reservoir fluid level.</p>
	<p>Is the fluid level OK?</p> <p>Yes</p> <p>GO to J3.</p> <p>No</p> <p>Check brake master cylinder reservoir sealing points. For additional information, refer to Brake master cylinder component test in this section. Add brake fluid and bleed the brake system. REFER to: Brake System Bleeding (206-00 Brake System - General Information, General Procedures). Re-test the system for normal operation.</p>
J3: CHECK BRAKE PEDAL RESERVE	
	<p>1 Run engine at idle speed.</p>

	2 Apply the brake pedal lightly three or four times.
	3 Wait 15 seconds for the vacuum to replenish.
	4 Push down on the brake pedal until it stops moving downward or an increased resistance to the brake pedal travel occurs.
	5 Hold the brake pedal in the applied position while increasing the engine speed to 2000 revs/min.
	6 Release the accelerator pedal.
	Does the brake pedal move downward as the engine speed returns to idle? Yes GO to J4. No Check the vacuum to the brake booster.
J4: CHECK THE FRONT WHEEL BEARING ASSEMBLY	
	1 Check the front wheel bearing assembly.
	Are the front wheel bearings loose/damaged? Yes Tighten to specification or install a new front wheel bearing as required. REFER to: Front Wheel Bearing and Wheel Hub (204-01 Front Suspension, Removal and Installation). Re-test the system for normal operation. No Check the front brake discs for thickness variances.

PINPOINT TEST K : SLOW OR INCOMPLETE BRAKE PEDAL RETURN

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
K1: CHECK FOR BRAKE PEDAL RETURN	
	1 Run the engine at idle while making several brake applications.
	2 Pull the brake pedal rearward with approximately 44.5 N (10lb) force.
	3 Release the brake pedal and measure the distance to the toe board.
	4 Make a hard brake application.
	5 Release the brake pedal and measure the brake pedal to toe board distance. The brake pedal should return to its original position.
	Does the brake pedal return to its original position? Yes No action required, vehicle is OK. No GO to K2.
K2: CHECK FOR BRAKE PEDAL BINDING	
	1 Disconnect the brake booster from the brake pedal. Check the brake pedal to ensure free operation.
	Is the brake pedal operating freely? Yes Install a new brake booster as required. REFER to: Brake Booster (206-07 Power Brake Actuation, Removal and Installation), Brake Booster - RHD (206-07, Removal and Installation). Re-test the system for normal operation. No Repair or install new brake pedal. Re-test the system for normal operation.

Component Tests

Brake Booster

- 1.** Check all hoses and connections. All unused vacuum connectors should be capped. Hoses and their connections should be correctly secured and in good condition with no holes and no collapsed areas. Inspect the valve on the brake booster for damage.
- 2.** Check the hydraulic brake system for leaks or low fluid.
- 3.** With the automatic transmission in PARK, stop the engine and apply the parking brake. Pump the brake pedal several times to exhaust all vacuum in the system. With the engine switched off and all vacuum in the system exhausted, apply the brake pedal and hold it down. Start the engine. If the vacuum system is operating, the brake pedal will tend to move downward under constant foot pressure. If no motion is felt, the vacuum booster system is not functioning.
- 4.** Remove the vacuum hose from the brake booster. Manifold vacuum should be available at the brake booster end of the hose with the engine at idle speed and the automatic transmission in PARK. Make sure that all unused vacuum outlets are correctly capped, hose connectors are correctly secured and vacuum hoses are in good condition. When it is established that manifold vacuum is available to the brake booster, connect the vacuum hose to the brake booster and repeat Step 3. If no downward movement of the brake pedal is felt, install a new brake booster.
- 5.** Operate the engine for a minimum of 10 seconds at a fast idle. Stop the engine and allow the vehicle to stand for 10 minutes. Then, apply the brake pedal with approximately 89 N (20lb) of force. The pedal feel (brake application) should be the same as that noted with the engine running. If the brake pedal feels hard (no power assist), install a new valve and then repeat the test. If the brake pedal still feels hard, install a new brake booster. If the brake pedal movement feels spongy, bleed the brake system.
REFER to: [Brake System Bleeding](#) (206-00 Brake System - General Information, General Procedures).

Brake Master Cylinder

Usually, the first and strongest indicator of anything wrong in the brake system is a feeling through the brake pedal. In diagnosing the condition of the brake master cylinder, check pedal feel as evidence of a brake concern. Check for brake warning lamp illumination and the brake fluid level in the brake master cylinder reservoir.

Normal Conditions

The following conditions are considered normal and are not indications that the brake master cylinder is in need of repair.

- Modern brake systems are designed to produce a pedal effort that is not as hard as in the past. Complaints of light pedal efforts should be compared to the pedal efforts of another vehicle of the same model and year.
- The fluid level will fall with brake pad wear.

Abnormal Conditions

Changes in the brake pedal feel or brake pedal travel are indicators that something could be wrong in the brake system. The diagnostic procedure and techniques use brake pedal feel, warning indicator illumination and low brake fluid level as indicators to diagnosing brake system concerns. The following conditions are considered abnormal and indicate that the brake master cylinder is in need of repair:

- **NOTE:** Prior to carrying out any diagnosis, make sure the brake system warning indicator is functional.
- Brake pedal goes down fast. This could be caused by an external or internal leak.
- Brake pedal goes down slowly. This could be caused by an internal or external leak.
- Brake pedal is low or feels spongy. This condition may be caused by no fluid in the brake master cylinder, reservoir cap vent holes clogged or air in the hydraulic system.
- Brake pedal effort is excessive. This may be caused by a bind or obstruction in the pedal/linkage, a faulty non-return valve, booster or insufficient booster vacuum.
- Rear brakes lock up during light pedal force. This may be caused by damaged brake pads, a partially applied parking brake, a damaged ABS sensor or bearing failure.
- Brake pedal effort erratic. This condition could be caused by the brake booster or incorrectly installed brake pads.
- Brake warning indicator is on. This may be caused by low fluid level or float assembly damaged.

Non Pressure Leaks

Any reduced fluid volume in the brake master cylinder reservoir may be caused by two types of none pressure external leaks.

Type 1: An external leak may occur at the brake master cylinder reservoir cap because of incorrect positioning of the gasket and cap. Reposition cap and gasket.

Type 2: An external leak may occur at the brake master cylinder reservoir mounting seals. Repair such a leak by installing new seals and make sure that the brake master cylinder reservoir retaining bolt is correctly installed.

Brake System - General Information - Brake Disc Runout Check

General Procedures

Check

1. Remove the wheel and tire.
For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).
2. Install all wheel nuts and tighten equally to 20 Nm (15 lb.ft).
 - Make sure that the brake disc is fully seated against the hub face.
3. Install a dial test indicator gauge and holding fixture to a suitable mounting point.
4. **NOTE:** If the runout is outside specification, check the hub face runout.

Using the dial test indicator, measure the inner and outer faces of the brake disc.

For additional information, refer to: Specifications (206-03, Specifications) / Specifications (206-04, Specifications).

1. Position the gauge so that it contacts the disc 10 mm (0.4 in) from the outer edge.
 2. Slowly rotate the hub/disc assembly. Note the reading.
5. If a front hub runout check is required, remove the front brake disc.
For additional information, refer to: Brake Disc - Vehicles With: Standard Brakes (206-03 Front Disc Brake, Removal and Installation).
 6. If a rear hub runout check is required, remove the rear brake disc.
For additional information, refer to: Brake Disc - Vehicles With: Standard Brakes (206-04 Rear Disc Brake, Removal and Installation).
7. **NOTE:** The hub surface should be free from dirt and corrosion. Do not use abrasive cloths to clean hub faces.

Using the dial test indicator, measure the hub face runout.

1. Position the gauge so that it contacts the mounting tube between the stud and the chamfer.
 2. Slowly rotate the hub and note the runout. For additional information, refer to the specification chart.
- If the front hub runout exceeds the specifications, install a new hub, brake disc and recheck.
For additional information, refer to: Wheel Bearing and Wheel Hub (204-01 Front Suspension, Removal and Installation).
If the rear hub runout exceeds the specifications, install a new hub, brake disc and recheck.
For additional information, refer to: Rear Wheel Bearing (204-02 Rear Suspension, Removal and Installation).
8. If the front hub face is within specification, install a new brake disc.
For additional information, refer to: Brake Disc - Vehicles With: Standard Brakes (206-03 Front Disc Brake, Removal and Installation).
If the rear hub face is within specification, install a new disc.
For additional information, refer to: Brake Disc - Vehicles With: Standard Brakes (206-04 Rear Disc Brake, Removal and Installation).
 9. Install the wheel and tire.
For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

Brake System - General Information - Brake System Bleeding

General Procedures

• CAUTIONS:

The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

• NOTE:

All vehicles

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Check that the brake fluid lines are secure and that there are no signs of a brake fluid leak. If a brake fluid leak is detected, investigate and rectify the cause of the leak before bleeding the brakes.
- Remove the brake master cylinder cover.
 - Carefully release the clip.

- WARNING:** Do not allow dirt or foreign liquids to enter the reservoir. Use only new brake fluid of the correct specification from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

CAUTION: Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

Remove the brake fluid reservoir cap.

5. Fill the brake fluid reservoir to the MAX mark.

All vehicles

6. Install the bleed tube to the right hand rear brake caliper bleed screw and immerse the free end of the bleed tube in a bleed jar, containing a small quantity of approved brake fluid.

- Remove the bleed screw caps.

7. Loosen the bleed screw by one-half to three-quarters of a turn.

8.  CAUTION: The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

• NOTE: If the bleed tube used, does not have a one way valve the bleed screw will need to be closed before the brake pedal is returned to the rest position. Then opened again and the procedure repeated for each pedal application.

With assistance, depress the brake pedal steadily through its full stroke and allow it to return to the rest position. Repeat the procedure until brake fluid, clean and air-free flows into the bleed jar.

9.  CAUTION: Make sure the bleed screw cap is installed after bleeding. This will prevent corrosion to the bleed screw.

With the brake pedal fully depressed, tighten the bleed screw.

- Vehicles with standard brakes: Tighten the front caliper bleed screw to 8 Nm.
- Vehicles with high performance brakes: Tighten the front caliper bleed screw to 14 Nm.
- Tighten the rear bleed screw to 14 Nm.

10. Fill the brake fluid reservoir to the MAX mark.

Left-hand drive vehicles

11.  **WARNING:** Braking efficiency may be seriously impaired if an incorrect bleed sequence is used.

Repeat the brake bleeding procedure for each brake caliper, following the above sequence.

Right-hand drive vehicles

12.  **WARNING:** Braking efficiency may be seriously impaired if an incorrect bleed sequence is used.

Repeat the brake bleeding procedure for each brake caliper, following the above sequence.

All vehicles

- 13.** Fill the brake fluid reservoir to the MAX mark.
- 14.** Apply the brakes and check for leaks.
- 15.** Install the brake fluid reservoir cap.
- 16.** Install the brake master cylinder cover.
 - Carefully secure the clip.

Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 -

Lubricants, Fluids, Sealers and Adhesives

CAUTION: Do not use brake fluid ITT Super Dot 4 on 2006my vehicles onwards. Failure to follow this instruction may result in damage to the vehicle.

• **NOTE:** Brake fluid ITT Super Dot 4 has now been superseded by Shell ESL Super Dot 4 which is the Jaguar recommended brake fluid. Shell ESL Super Dot 4 can be used on all model years.

Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Front Disc Brake - Overview

Description and Operation

Overview

Standard Brakes

The standard front braking system used on naturally aspirated vehicles features 326 mm (12.83 in.) diameter x 30 mm (1.18 in.) thick ventilated brake discs and cast iron, single piston, sliding calipers. The brake disc is also manufactured from cast iron. The brake disc is retained on the wheel hub by two washers and the wheel nuts.

The caliper is mounted within a fixed carrier that is secured to the front wheel knuckle with two bolts. When hydraulic pressure is supplied to the caliper, the piston extends to force the inner pad against the brake disc. The caliper reacts and slides along two guide pins to bring the outer pad into contact with the brake disc.

Each inboard brake pad is installed with a pressed steel anti-rattle spring. There is no wear indicator installed in the brake pads.

Performance Brakes

The performance front braking system used on vehicles with supercharger features 355 mm (13.98 in.) diameter x 32 mm (1.26 in.) thick ventilated brake discs and composite aluminum and cast iron, single piston and sliding calipers. The brake disc is manufactured from cast iron. The brake disc is retained on the wheel hub by two washers and the wheel nuts.

The caliper is mounted within a fixed carrier that is secured to the front wheel knuckle with two bolts. When hydraulic pressure is supplied to the caliper, the piston extends to force the inner pad against the brake disc. The caliper reacts and slides along two guide pins to bring the outer pad into contact with the brake disc.

Each inboard brake pad is installed with a pressed steel anti-rattle spring. There is no wear indicator installed in the brake pads.

Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Front Disc Brake

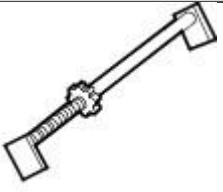

Diagnosis and Testing

For additional information.

Removal and Installation

Special Tool(s)	
 JDS9013	Brake pedal hold down tool
	JDS9013

Removal

CAUTION: Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the LH front wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

E60620

- CAUTION:** Always plug any open connections to prevent contamination.

• **NOTE:** To prevent the loss of brake fluid, using the special tool apply the brake pedal and set to 40mm (1.6 in) below the rest position.

• **NOTE:** Left-hand shown, right-hand similar.

Disconnect the brake hose from the brake caliper.

- Using the special tool, press and hold the brake pedal.
- Remove and discard the two sealing washers.

- NOTE:** Left-hand shown, right-hand similar.

Remove the LH anti-rattle spring.

- Release the 2 clips.

E63745

E63746

5.  CAUTION: Do not allow the brake caliper to hang on the brake hose.

• NOTE: Left-hand shown, right-hand similar.

Remove the LH brake caliper.

- Remove the 2 access plugs.
- Release the 2 brake caliper guide pins.
- Tie the brake caliper aside.

E63747

6. NOTE: Left-hand shown, right-hand similar.

Release the inboard brake pad from the caliper.

- Release the clip.

E63748

7. NOTE: Left-hand shown, right-hand similar.

Remove the outboard brake pad.

Installation

1. NOTE: Left-hand shown, right-hand similar.

Install the outboard brake pad.

- Using a suitable tool, fully retract the brake caliper piston.
- Clean the component mating faces.

E63748

2. NOTE: Left-hand shown, right-hand similar.

Install the inboard brake pad.

- Clean the component mating faces.

E63747

3. NOTE: Left-hand shown, right-hand similar.

Install the brake caliper.

- Tighten the guide pins to 28 Nm.
- Install the access plugs.

E63746

4. NOTE: Left-hand shown, right-hand similar.

Install the anti-rattle spring.

- Carefully secure the clips.

E63745

5. NOTE: Left-hand shown, right-hand similar.

Connect the brake hose to the brake caliper.

- Install new sealing washers.
- Tighten the union to 38 Nm.

E60620

6. Bleed the brake system.

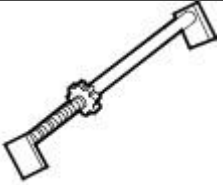

For additional information, refer to: [Brake System Bleeding](#) (206-00 Brake System - General Information, General Procedures).

7. Install the front wheels and tires.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Brake Caliper Vehicles With: High Performance Brakes

Removal and Installation

Special Tool(s)	
 JDS9013	Brake pedal hold down tool
	JDS9013

Removal

CAUTION: Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the front wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

-  **CAUTION:** Always plug any open connections to prevent contamination.

• **NOTE:** To prevent the loss of brake fluid, using the special tool apply the brake pedal and set to 40mm (1.6 in) below the rest position.

• **NOTE:** Left-hand shown, right-hand similar.

Disconnect the brake hose from the brake caliper.

- Using the special tool, press and hold the brake pedal.
- Remove and discard the two sealing washers.

- NOTE:** Left-hand shown, right-hand similar.

Apply protective tape to the caliper.

60661

E92955

5. Apply heatshrink or protective tape to the end of the screwdriver.

6.  CAUTION: Removal of the clips is a delicate procedure, damage will occur if any force is used.

- NOTE: Left-hand shown, right-hand similar.

Remove the anti-rattle spring.

- Lever the anti-rattle spring in the center of the spring until either side is released.

7.  CAUTION: Do not allow the brake caliper to hang on the brake hose.

- NOTE: Left-hand shown, right-hand similar.

Remove the brake caliper.

- Remove the 2 access plugs.
- Remove the 2 caliper guide pins.
- Tie the brake caliper aside.

8. NOTE: Left-hand shown, right-hand similar.

Release the inboard brake pad from the caliper.

- Release the clip.

9. NOTE: Left-hand shown, right-hand similar.

Remove the outboard brake pad.

Installation

1. NOTE: Left-hand shown, right-hand similar.

Install the outboard brake pad.

- Using a suitable tool, fully retract the brake caliper pistons.
- Clean the component mating faces.

2. NOTE: Left-hand shown, right-hand similar.

Install the inboard brake pad.

- Clean the component mating faces.

3. NOTE: Left-hand shown, right-hand similar.

Install the brake caliper.

- Tighten the guide pins to 58 Nm (43 lb.ft).
- Install the access plugs.

4. NOTE: Left-hand shown, right-hand similar.

Install the anti-rattle spring.

- Secure the bottom arm of the anti-rattle spring under the bottom anchor bracket of the caliper.
- Compress the upper spring arm into the correct position, under the upper anchor bracket, whilst retaining the logo plate.
- Using the screw-driver, tap the central locating tag into the locked position.

5. NOTE: Left-hand shown, right-hand similar.

Connect the brake hose to the brake caliper.

- Install new sealing washers.
- Tighten the union to 38 Nm (28 lb.ft).

6. Bleed the brake system.

For additional information, refer to: [Brake System Bleeding](#) (206-00 Brake System - General Information, General Procedures).

7. Install the front wheels and tires.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Brake Disc Vehicles With: Standard Brakes

Removal and Installation

Removal

CAUTION: Brake discs must be renewed in pairs, unless one disc requires changing before 1000 miles (1600 kilometers) from new.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the front brake pads.
For additional information, refer to: [Brake Pads - Vehicles With: Standard Brakes](#) (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

3. NOTE: LH illustration shown, RH is similar.

Remove the brake caliper anchor bracket.

- Remove and discard the 2 bolts.

E62264

4. NOTE: LH illustration shown, RH is similar.

Remove the brake disc.

- Remove the 2 clips.

E62265

Installation

3. Install the brake pads.
For additional information, refer to: [Brake Pads - Vehicles With: Standard Brakes](#) (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Install the brake caliper anchor bracket.

- Clean the component mating faces.
- Tighten the component mating faces.
- Secure the clips.

E62264

Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Brake Disc Vehicles With: High Performance Brakes

Removal and Installation

Removal

CAUTION: Brake discs must be renewed in pairs, unless one disc requires changing before 1000 miles (1600 kilometers) from new.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the front brake pads.
For additional information, refer to: [Brake Pads - Vehicles With: High Performance Brakes](#) (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
3. Remove the brake caliper anchor bracket.
 - Remove and discard the 2 bolts.

4. Remove the brake disc.

- Remove the 2 clips.

Installation

E83394

1.  **WARNING:** Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Install the brake disc.

- Clean the component mating faces.
- Secure the clips.

E62264

2.  **CAUTION:** Make sure that new bolts are installed.

Install the brake caliper anchor bracket.

- Clean the component mating faces.
- Tighten the bolts to 115 Nm.

3. Install the brake pads.

For additional information, refer to: [Brake Pads - Vehicles With: High Performance Brakes](#) (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Brake Disc Shield Vehicles With: Standard Brakes

Removal and Installation

Removal

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the brake disc.
For additional information, refer to: [Brake Disc - Vehicles With: Standard Brakes](#) (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
3. Remove the brake disc shield.
 - Remove the 3 rivets.

Installation

1. To install, reverse the removal procedure.
 - Install the rivets.

Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Brake Disc Shield Vehicles With: High Performance Brakes

Removal and Installation

Removal

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the front brake disc.
For additional information, refer to: [Brake Disc - Vehicles With: High Performance Brakes](#) (206-03 Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
3. Remove the brake disc shield.

- Remove the 2 rivets.

Installation

1. To install, reverse the removal procedure.

- Install the rivets.

Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Brake Pads Vehicles With: Standard Brakes

Removal and Installation

Removal

• WARNINGS:

Brake pads must be renewed in axle sets only. Failure to follow this instruction may result in braking efficiency being impaired.

Do not allow dirt or foreign liquids to enter the reservoir. Use only new brake fluid of the correct specification from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

CAUTION: Replacement of nuts and bolts: Various thread-locking devices are used on nuts and bolts throughout the vehicle. These devices restrict the number of times a nut or bolt can be used.

- WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the front wheels and tires.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

- NOTE:** Left-hand shown, right-hand similar.

Remove the anti-rattle spring.

- Release the 2 clips.

E62266

- CAUTION:** Do not allow the brake caliper to hang on the brake hose.

- **NOTE:** Left-hand shown, right-hand similar.

Remove the brake caliper.

- Remove the 2 access plugs.
- Remove the 2 caliper guide pins.
- Tie the brake caliper aside.

E62267

5. NOTE: Left-hand shown, right-hand similar.

Release the inboard brake pad from the caliper.

- Release the clip.

6. NOTE: Left-hand shown, right-hand similar.

Remove the outboard brake pad.

7. NOTE: Left-hand shown, right-hand similar.

Repeat the above procedure for the RH brake pads.

Installation

1.  **WARNING:** Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the brake caliper housings and anchor plates, using brake cleaning fluid.

2. CAUTIONS:

 As the piston is pushed back into the caliper housing, the brake fluid level in the reservoir will rise. Do not allow the reservoir to overflow.

 Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

Press the pistons into the caliper housing.

3. Install the brake pads.

- Secure the inboard brake pad in the clip.
- Position the outboard brake pad.

E62267

4. NOTE: Left-hand shown, right-hand similar.

Install the brake caliper.

- Tighten the guide pins to 28 Nm.
- Install the access plugs.

E62266

5. NOTE: Left-hand shown, right-hand similar.

Install the anti-rattle spring.

- Carefully secure the clips.

6. Repeat the above procedure for the RH brake pads.

7. Install the front wheels and tires.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

Front Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Brake Pads Vehicles With: High Performance Brakes

Removal and Installation

Removal

• WARNINGS:

Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Brake pads must be renewed in axle sets only. Failure to follow this instruction may result in braking efficiency being impaired.

Do not allow dirt or foreign liquids to enter the reservoir. Use only new brake fluid of the correct specification from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

• CAUTIONS:

Replacement of nuts and bolts: Various thread-locking devices are used on nuts and bolts throughout the vehicle. These devices restrict the number of times a nut or bolt can be used.

The High performance brake caliper is aligned to the brake disc when it is first installed to the vehicle, therefore, care must be taken not to disturb this alignment. When removing the caliper, remove the bolts that secure the anchor bracket to the vertical link and/or the guide pin bolts only. DO NOT loosen any other caliper bolts.

• NOTE: Open engine compartment and fit paint work protection covers to fenders.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the front road wheels and tires.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

3. NOTE: Left-hand shown, right-hand similar.

Apply protective tape to the caliper.

E92955

4.  CAUTION: Removal of the clips is a delicate procedure, damage will occur if any force is used.

Apply heatshrink or protective tape to the end of the screwdriver.

5.  CAUTION: Removal of the clips is a delicate procedure, damage will occur if any force is used.

• NOTE: Left-hand shown, right-hand similar.

Remove the anti-rattle spring.

- Lever the anti-rattle spring in the center of the spring until either side is released.

6.  CAUTION: Do not allow the brake caliper to hang on the brake hose.

• NOTE: Left-hand shown, right-hand similar.

Remove the brake caliper.

- Remove the 2 access plugs.
- Remove the 2 caliper guide pins.
- Tie the brake caliper aside.

7. NOTE: Left-hand shown, right-hand similar.

Release the inboard brake pad from the caliper.

- Release the clip.

8. NOTE: Left-hand shown, right-hand similar.

Remove the outboard brake pad.

9. Repeat the above procedure on the opposite side.

Installation

1.  **WARNING:** Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the brake caliper housings and anchor plates, using brake cleaning fluid.

2. **CAUTIONS:**

 As the piston is pushed back into the caliper housing, the brake fluid level in the reservoir will rise. Do not allow the reservoir to overflow.

 Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

Press the piston into the caliper housing.

3. Install the brake pads.

- Secure the inboard brake pad in the clip.
- Position the outboard brake pad.

4. NOTE: Left-hand shown, right-hand similar.

Install the brake caliper.

- Tighten the guide pins to 58 Nm.
- Install the access plugs.

5. NOTE: Left-hand shown, right-hand similar.

Install the anti-rattle spring.

- Secure the bottom arm of the anti-rattle spring under the bottom anchor bracket of the caliper.
- Compress the upper spring arm into the correct position, under the upper anchor bracket, whilst retaining the logo plate.
- Using the screw-driver, tap the central locating tag into the locked position.

6. Repeat the above procedure on the opposite side.

7. Install both wheels and tires.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Rear Disc Brake - Overview

Description and Operation

Overview

The rear braking system on all vehicles features 326 mm (12.83 in.) diameter x 20 mm (0.79 in.) thick ventilated brake discs with aluminum, single acting piston, sliding calipers. The brake disc is manufactured from cast iron. The disc is retained on the wheel hub by two washers and the wheel nuts.

The caliper is mounted within a fixed carrier that is secured to the rear wheel knuckle with two bolts. When hydraulic pressure is supplied to the caliper, the piston extends to force the inner pad against the brake disc. The caliper reacts and slides along two guide pins to bring the outer pad into contact with the brake disc. The brake calipers on the supercharged vehicle are painted and also include a logo badge, which must be removed in order to renew the brake pads.

Each inboard brake pad is installed with a wire type anti-rattle spring. There is no wear indicator installed in the brake pads.

Also incorporated into each rear brake caliper carrier is the parking brake mechanism.
Refer to: [Parking Brake](#) (206-05 Parking Brake and Actuation, Description and Operation).

After any work on the rear brakes, the parking brake must be re-calibrated.
Refer to: [Parking Brake](#) (206-05 Parking Brake and Actuation, Diagnosis and Testing).

Removal

 **WARNING:** Failure to release the tension and calibrate the electric parking brake during rear parking brake related service procedures, could cause the parking brake to function incorrectly or become inoperative.

 **CAUTION:** Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

All vehicles

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the rear wheel and tire.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

3. Release the parking brake cable tension.

For additional information, refer to: [Parking Brake Cable Tension Release](#) (206-05 Parking Brake and Actuation, General Procedures).

Vehicles with high performance brakes

4. **NOTE:** Left-hand shown, right-hand similar.

Remove the logo badge.

- Remove the two retaining screws.

E61746

All vehicles

5.  **CAUTION:** Always plug any open connections to prevent contamination.

• **NOTE:** To prevent the loss of brake fluid, using the special tool apply the brake pedal and set to 40mm (1.6 in) below the rest position.

• **NOTE:** RH illustration shown, LH is similar.

Disconnect the brake hose from the brake caliper.

- Using the special tool, press and hold the brake pedal.
- Remove and discard the two sealing washers.

E63462

6. NOTE: RH illustration shown, LH is similar.

Remove the anti-rattle spring.

- Release the 2 clips.

E62738

7. Disconnect and release the parking brake cable from the caliper.

- Release the clip.

8. NOTE: RH illustration shown, LH is similar.

Remove the brake caliper.

- Remove the 2 access plugs.
- Release the 2 brake caliper guide pins.

E66773

9. NOTE: RH illustration shown, LH is similar.

Remove the brake pads.

E62740

Installation

All vehicles

1. Install the brake pads.

E66773

2. Install the brake caliper.

- Tighten the guide pins to 28 Nm.
- Install the access plugs.

E62738

3. Install the anti-rattle spring.

- Carefully secure the clips.

E63462

4. Connect the brake hose to the brake caliper.

- Install new sealing washers.
- Tighten the union to 38 Nm.

5. Connect the parking brake cable.

- Carefully secure the clips.

Vehicles with high performance brakes

6. NOTE: Left-hand shown, right-hand similar.

Install the logo badge.

- Install the two retaining screws.

E61746

All vehicles

7. Bleed the brake system.

For additional information, refer to: [Brake System Bleeding](#) (206-00 Brake System - General Information, General Procedures).

8. Install the wheel and tire.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

9. Re-calibrate the electric park brake.

For additional information, refer to: [Parking Brake Cable Tension Release](#) (206-05 Parking Brake and Actuation, General Procedures).

Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Brake Disc

Removal and Installation

Removal

CAUTION: Brake discs must be renewed in pairs, unless one disc requires changing before 1000 miles (1600 kilometers) from new.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the rear brake pads.

For additional information, refer to: [Brake Pads](#) (206-04 Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

3. Remove the brake caliper anchor bracket.

- Remove and discard the 2 bolts.

E62736

4. Remove the brake disc.

- Remove the 2 clips.

E62737

Installation

1. WARNING: Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Install the brake disc.

- Clean the component mating faces.
- Secure the clips.

E62737

E62736

2.  CAUTION: Make sure that new bolts are installed.

Install the brake caliper anchor bracket.

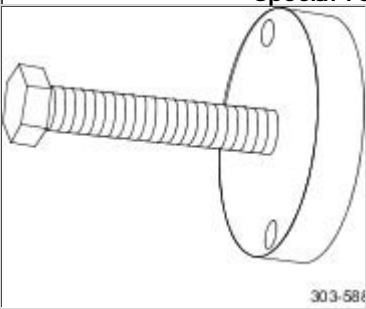

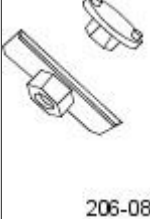

- Clean the component mating faces.
- Tighten the bolts to 103 Nm.

3. Install the brake pads.

For additional information, refer to: [Brake Pads](#) (206-04 Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

 <p>206-081</p>	Brake caliper piston retractor tool 206-081

Removal

- WARNINGS:

Brake pads must be renewed in axle sets only, otherwise braking efficiency may be impaired.

Do not allow dirt or foreign liquids to enter the reservoir. Use only new brake fluid of the correct specification from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

Failure to release the tension and calibrate the electric parking brake during rear parking brake related service procedures, could cause the parking brake to function incorrectly or become inoperative.

- NOTE: Only extraction bolt from special tool 303-588 is used.

All vehicles

1. **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Release the parking brake cable tension.
For additional information, refer to: [Parking Brake Cable Tension Release](#) (206-05 Parking Brake and Actuation, General Procedures).

3. Remove the rear wheels and tires.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

Vehicles with high performance brakes

4. NOTE: Left-hand shown, right-hand similar.

Remove the logo badge.

- Remove the two retaining screws.

E61746

All vehicles

5. NOTE: Right-hand shown, left-hand similar.

Remove the anti-rattle spring.

- Release the 2 clips.

E62738

6.  CAUTION: Do not allow the brake caliper to hang on the brake hose.

• NOTE: Right-hand shown, left-hand similar.

Remove the brake caliper.

- Remove the 2 access plugs.
- Release the 2 brake caliper guide pins.
- Tie the brake caliper aside.

E62739

7. NOTE: Right-hand shown, left-hand similar.

Remove the brake pads.

E62740

8. Repeat the above procedure for the other side.

Installation

All vehicles

1.  **WARNING:** Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the brake caliper housings and anchor plates, using brake cleaning fluid.

- Repeat the above procedure for the other side.

2. CAUTIONS:

 As the piston is pushed back into the caliper housing, the brake fluid level in the reservoir will rise. Do not allow the reservoir to overflow.

 Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

Using the special tools, fully retract the brake caliper piston.

3. NOTE: Right-hand shown, left-hand similar.

Install the brake pads.

- Position the inboard brake pad.
- Position the outboard brake pad.

4. NOTE: Right-hand shown, left-hand similar.

Install the brake caliper.

- Tighten the guide pins to 28 Nm.

5. NOTE: Right-hand shown, left-hand similar.

Install the anti-rattle spring.

- Carefully secure the clips.

E62738

Vehicles with high performance brakes

6. NOTE: Left-hand shown, right-hand similar.

Install the logo badge.

- Install the two retaining screws.

E61746

All vehicles

7. Repeat the above procedure for the other side.

8. Install the wheels and tires.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

9.  **WARNING:** Calibrate the electric park brake using Jaguar approved diagnostic equipment. If Jaguar approved diagnostic equipment is not available disconnect the battery for approximately 30 seconds, the vehicle will then prompt the driver to carry out the calibration procedure as per the vehicle hand book on re-connection.

Re-calibrate the electric park brake.

For additional information, refer to: [Parking Brake Cable Tension Release](#) (206-05 Parking Brake and Actuation, General Procedures).

Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Brake Disc Shield

Removal and Installation

Removal

WARNING: Make sure to support the vehicle with axle stands.

1. Raise and support the body.
2. Remove the brake disc.
For additional information, refer to: [Brake Disc](#) (206-04 Rear Disc Brake - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
3. Remove the brake disc shield.
 - Drill out the 3 rivets

VUJ0000503

Installation

1. To install, reverse the removal procedure.

Parking Brake and Actuation - Parking Brake - Overview

Description and Operation

Overview

The parking brake is an electrically actuated system that operates on the rear brake calipers. Two cables are connected to the rear brake calipers, and act directly on the same pistons used for normal, hydraulic rear brake actuation. Refer to: Rear Disc Brake (206-04, Description and Operation).

The parking brake is controlled by the EPB (electronic parking brake) module. In response to commands from the driver through the parking brake switch, the EPB module controls operation of the parking brake actuator. The actuator adjusts the tension of the brake cables to apply and release the rear brake calipers. Features of the parking brake include:

- Manual apply.
- Manual release.
- Automatic release.

A service mode is also available and must be activated using the Jaguar approved diagnostic system. This allows the decoupling of the components and prevention of damage to the actuator. When in service mode all switch functions will be inhibited.

Parking Brake and Actuation - Parking Brake - System Operation and Component Description

Description and Operation

Control Diagram

• NOTE: **A** = Hardwired; **D** = High speed CAN (controller area network) bus.

E93527

ItemDescription

1	Battery
2	BJB (battery junction box)
3	CJB (central junction box)
4	RJB (rear junction box)
5	EPB module
6	Stoplamp switch
7	Instrument cluster
8	Parking brake switch
9	Parking brake actuator

System Operation

Static Apply

The EPB module receives a vehicle speed signal from the [ABS \(anti-lock brake system\)](#) module on the high speed [CAN](#) bus. If the parking brake switch is pulled to the 'Apply' position and vehicle speed is less than 2 mph (3 km/h), the EPB module will instigate its 'Static Apply' mode and drive the actuator to apply full parking brake force to the rear wheels.

The EPB module monitors the current drawn by the actuator and compares this to information held within its configuration software to determine when full braking force has been applied.

Dynamic Apply

There are two 'Dynamic Apply' modes; low speed dynamic and high speed dynamic. The low speed dynamic mode operates at speeds between 2 mph (3 km/h) and 20 mph (32 km/h). The high speed dynamic mode operates at speeds above 20 mph (32 km/h).

If the parking brake switch is pulled up to the 'Apply' position and vehicle speed is within the low speed dynamic range, the EPB module drives the actuator to apply full parking brake force to the rear wheels.

If the parking brake switch is pulled up to the 'Apply' position and vehicle speed is within the high speed dynamic range, the EPB module will apply braking force to the rear wheels at a slower rate until full braking load is reached or the switch is released. The rate with which braking force is applied is controlled by the EPB module, which monitors both current drawn by the actuator and positional information from the actuator hall sensor and compares this to information held within its configuration software.

Drive Away Release

The EPB module will initiate its 'Drive Away Release' function and automatically release the parking brake if the following conditions are detected:

- The engine is running.
- Drive , or reverse is selected.
- Positive throttle movement is detected.

The EPB module receives messages of gear selector position and throttle angle over the high speed [CAN](#) bus from the [TCM \(transmission control module\)](#) and the [ECM \(engine control module\)](#) respectively.

Release from Park

The EPB module will initiate its 'Release from Park' function and automatically release the parking brake if the gear selector is moved from Park to any position except Neutral.

Repairs

Before carrying out any work on the parking brake system, the Jaguar approved diagnostic system must be connected and the 'parking brake unjam' routine run. The routine can be found in the 'Vehicle Configuration' area, under the 'Set-up and Configuration' menu. After any work has been carried out on the parking brake, the system will require resetting.

CAUTION: Do not use the 'Emergency Release' tool to allow work to be carried out on the parking brake. Work can only be carried out on the parking brake system after the 'parking brake unjam' routine has been run.

Resetting

If the electrical supply is disconnected from the EPB module, the actuator will lose its position memory. On battery re-connection and ignition on, 'APPLY FOOT AND PARK BRAKE' will be displayed in the instrument cluster message center indicating the parking brake requires resetting.

Refer to: [Parking Brake](#) (206-05 Parking Brake and Actuation, Diagnosis and Testing).

Operating Voltages

The EPB module will only operate the actuator if the power supply from the battery is between 9 V and 16 V. At any voltage within this range, the actuator is able to fully tighten and release the brake cables. If the power supply falls outside of the range, a fault code is stored in the EPB module and can be retrieved using the Jaguar approved diagnostic system.

Component Description

Parking Brake Switch

E93523

The parking brake switch is mounted in the floor console, rearward of the rotary gear selector. The switch has 3 states:

- Apply: When the switch is pulled up to apply the parking brake.
- Release: When the switch is pushed down to release the parking brake.
- Neutral: The central default position. The switch returns to this position regardless of parking brake status.

The parking brake switch contains a pair of micro-switches for both the apply and release actions. The EPB module provides an individual hardwired electrical feed to each of the four micro-switches plus a single ground connection, allowing it to constantly monitor switch status.

EPB Module

E93524

The EPB module is mounted in the luggage compartment on the **RH (right-hand)** side quarter panel and is connected to the vehicles electrical wiring by two multiplugs. The EPB module is also connected to the high speed [CAN](#) bus, allowing it to communicate with other vehicle systems.

The EPB module monitors the condition of the parking brake switch through a series of hardwired electrical connections and controls operation of the parking brake actuator accordingly.

Parking Brake Actuator

E93525

The parking brake actuator is mounted on the rear cross beam, underneath the vehicle. Operation of the actuator is controlled by the EPB module in response to parking brake switch requests from the driver.

A Hall sensor is located within the actuator and provides positional information back to the EPB module. The principle function of the Hall sensor is to ensure the actuator fully releases the parking brake when a static release request is made. The signal provided by the Hall sensor is compared to configuration information contained within the EPB module software to determine when a full release has been carried out.

Stoplamp Switch

E93526

The stoplamp switch is mounted on the brake pedal box. One of the prerequisites for releasing the parking brake is that the foot brake is applied. The EPB module is able to determine the position of the footbrake by monitoring the status of the stoplamp switch via a hardwired electrical connection.

The stoplamp switch also forms part of:

- The [ABS](#).
Refer to: [Anti-Lock Control - Stability Assist](#) (206-09 Anti-Lock Control - Stability Assist, Description and Operation).
- The speed control system. For additional information, refer to:
Speed Control (310-03A, Description and Operation),
Speed Control (310-03B, Description and Operation),
[Speed Control](#) (310-03 Speed Control - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

Instrument Cluster

Depending on market specification, the instrument cluster may contain a red and an amber brake warning indicator, or only a red brake warning indicator. The functionality of the warning indicators is shown in the table below.

Indicator	Status	Details
Red	Illuminated	Parking brake applied
Red	Flashing	Parking brake electrical failure
Amber	Illuminated	Parking brake electrical failure

If a parking brake failure warning indicator is active, the message 'CANNOT APPLY PARK BRAKE' or 'PARK BRAKE FAULT' will also appear in the instrument cluster message center. If the vehicle is moving with the parking brake applied, the message 'PARK BRAKE ON' will appear in the message center accompanied by a chime from the instrument cluster.

Refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

Parking Brake and Actuation - Parking Brake

Diagnosis and Testing

Principle of Operation

For a detailed description of the Parking Brake system, refer to the relevant Description and Operation sections of the workshop manual. REFER to: (206-05 Parking Brake and Actuation)

[Parking Brake](#) (Description and Operation),
[Parking Brake](#) (Description and Operation),
[Parking Brake](#) (Description and Operation).

Parking Brake Calibration

The parking brake system must be calibrated whenever the battery has been disconnected or has been in a state of discharge, or repairs have been carried out to the rear service or parking brake system.

• **NOTE:** If new rear brake pads have been installed, pressure must be applied to the brake pedal a minimum of five times prior to calibration of the parking brake system.

To calibrate the parking brake system:

1. **1.** Place gear selector lever in 'P' Park position.
2. **2.** Release parking brake cable tension to service position.
REFER to: [Parking Brake Cable Tension Release](#) (206-05 Parking Brake and Actuation, General Procedures).
3. **3.** Set the ignition status to 'ON'.
4. **4.** Apply and hold the footbrake then pull up the parking brake switch.
5. **5.** To release the parking brake, apply and hold the footbrake then press down the parking brake switch.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Parking brake cable ● Parking brake actuator ● Brake caliper ● Brake pads ● Stabilizer bar drop link rubber cable deflector block 	<ul style="list-style-type: none"> ● Fuse(s) ● Wiring harness/electrical connectors ● Check for bent/corroded pins ● Parking brake switch ● Parking brake module

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident check the system for any logged Diagnostic Trouble Codes (DTCs) and proceed to the DTC Index , alternatively, verify the customer concern and refer to the Symptom Chart.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• **NOTE:** If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer approved diagnostic system).

• **NOTE:** When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance always take the resistance of the DMM leads into account.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

Parking Brake and Actuation - Parking Brake Cable Tension Release

General Procedures

Special Tool(s)	
 <p>206-082</p>	<p>Electric parking brake release tool 206-082. Only to be used for EMERGENCY brake release</p>
 <p>E69907</p>	<p>Electric parking brake release tool link lead 206-082-01. Only to be used for EMERGENCY brake release</p>

 **WARNING:** Failure to release the tension and calibrate the electric parking brake during rear parking brake related service procedures, could cause the parking brake to function incorrectly or become inoperative.

-  **WARNING:** Always use Jaguar approved diagnostic equipment to release the cable tension, when carrying out repair operations on the electric park brake which require cable tension release.

Connect the Jaguar approved diagnostic equipment to release the electric parking brake cable tension.

- Follow the on-screen instructions.

-  **WARNING:** The procedure below should only be used in emergency situations, to release the electric park brake. All calibration of the parking brake system will be lost, and the parking brake will need to be re-calibrated to function correctly.

- **NOTE:** The tools shown must only be used in the event of an emergency.

Remove the RH loadspace trim panel.

For additional information, refer to: [Loadspace Trim Panel RH](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

-  **WARNING:** Failure to follow this instruction may result in a diagnostic trouble code (DTC) being generated.

Disconnect the 2 electrical connectors from the parking brake module, in the sequence illustrated.

4. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Connect the special tool to the parking brake module.

5. Release the parking brake cable tension.

- An audible 'click', signals complete parking brake cable tension release.

6. Remove the special tool and carry out any necessary repairs on the system.

7. Connect the electrical connectors in the sequence shown.

8. Install the RH loadspace trim panel.

For additional information, refer to: [Loadspace Trim Panel RH](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

9.  **WARNING:** Calibrate the electric park brake using Jaguar approved diagnostic equipment. If Jaguar approved diagnostic equipment is not available disconnect the battery for approximately 30 seconds, the vehicle will then prompt the driver to carry out the calibration procedure as per the vehicle hand book on re-connection.

Calibrate the electric park brake.

Parking Brake and Actuation - Parking Brake Cable LH2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8

Removal and Installation

Removal

WARNING: Failure to release the tension and calibrate the electric parking brake during rear parking brake related service procedures, could cause the parking brake to function incorrectly or become inoperative.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the LH rear wheel and tire.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

3. Release the parking brake cable tension.

For additional information, refer to: [Parking Brake Cable Tension Release](#) (206-05 Parking Brake and Actuation, General Procedures).

4. Detach the LH parking brake cable.

1. Detach the LH parking brake cable from the retaining tang.

2. Release the 2 clips.

E65415

5. **NOTE:** Note the fitted position.

Detach and remove the LH parking brake cable from the caliper.

1. Detach the LH parking brake cable.

2. Release the 2 clips.

E65416

Installation

1. **NOTE:** Align to the position noted on removal.

Install the LH parking brake cable.

- Carefully secure the clips.
- Attach the LH parking brake cable.

2. **NOTE:** Make sure that the RH parking brake cable is correctly set in the retaining tang.

3. Install the wheel and tire. For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation). Attach the LH parking brake cable.

- Carefully secure the clips.
- Attach the LH parking brake cable to the retaining tang.

Parking Brake and Actuation - Parking Brake Cable RH2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8

Removal and Installation

Removal

WARNING: Failure to release the tension and calibrate the electric parking brake during rear parking brake related service procedures, could cause the parking brake to function incorrectly or become inoperative.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the RH rear wheel and tire.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

3. Release the parking brake cable tension.

For additional information, refer to: [Parking Brake Cable Tension Release](#) (206-05 Parking Brake and Actuation, General Procedures).

4. Detach the RH parking brake cable.

1. Detach the RH parking brake cable from the retaining tang.

2. Release the 2 clips.

5. NOTE: Note the fitted position.

Detach and remove the RH parking brake cable from the caliper.

1. Detach the RH parking brake cable.

2. Release the 2 clips.

Installation

1. NOTE: Align to the position noted on removal.

Install the RH parking brake cable.

- Carefully secure the clips.
- Attach the RH parking brake cable.

2. NOTE: Make sure that the RH parking brake cable is correctly seated in the retaining tang.

3. Install the wheel and tire. For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

Attach the RH parking brake cable.

- Carefully secure the clips.
- Attach the RH parking brake cable to the retaining tang.

Parking Brake and Actuation - Parking Brake Module

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Refer to: [Loadspace Trim Panel RH](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Torque: 4 Nm

Installation

1. To install, reverse the removal position
2. Configure the electronic parking brake (EPB) using the diagnostic tool.

Parking Brake and Actuation - Parking Brake Switch

Removal and Installation

Removal

- NOTE: The parking brake switch is part of the transmission control switch (TCS) assembly and therefore can not be serviced separately.
- NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Refer to: [Transmission Control Switch \(TCS\)](#) (307-05 Automatic Transmission/Transaxle External Controls, Removal and Installation).

Installation

1.  CAUTION: Make sure that all diagnostic trouble codes (DTCs) have been removed after the road test.

To install, reverse the removal procedure.

Parking Brake and Actuation - Parking Brake Release Actuator 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8

Removal and Installation

Removal

1. Carry out the parking brake cable tension release.
For additional information, refer to: [Parking Brake Cable Tension Release](#) (206-05 Parking Brake and Actuation, General Procedures).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Disconnect the parking brake release actuator electrical connector.

4. Remove the parking brake release actuator retaining bolts.

5. Detach the parking brake release actuator cable.

1. For right-hand side connector bracket:
 1. Reposition the retaining tang.

2. Detach the parking brake cable.

2. For left-hand side reaction bracket, detach the parking brake cable.

6. NOTE: Note the fitted position.

Detach the parking brake release actuator cable.

VUJ0005174

7. Remove the engine rear undershield.

For additional information, refer to: [Engine Rear Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

8. Remove the rear crossmember.

E96679

9. Remove the rear subframe crossbrace.

- Remove the rear subframe crossbrace.

E96680

E98780

10.  **CAUTION:** Under no circumstances must the flexible coupling (or its fixings) be loosened or removed from the driveshaft.

Detach the driveshaft from the rear drive axle flange.

- Mark the position of the driveshaft in relation to the rear drive axle flange.
- Mark the position of the balance nut in relation to the rear drive axle flange. (if fitted).
- Mark the position of each nut and bolt in relation to the driveshaft flexible joint.

11. Using the special tool, support the axle assembly.

12. Remove the axle assembly retaining bolts.

E30809

13.  **CAUTION:** Make sure the halfshafts remain clear of the rear suspension/subframe.

Lower the rear axle assembly.

14. Remove the parking brake actuator.

E96960

Installation

1. NOTE: Make sure the parking brake cable is correctly routed.

• NOTE: Make sure that the parking brake cables are correctly seated in the retaining tangs.

To install, reverse the removal procedure.

- Tighten to 20 Nm.

E38609

E30276

2. Tighten to 190 Nm.

E30275

3. Tighten to 90 Nm.

4. Tighten to 108 Nm.

E98780

5. Tighten to 30 Nm.

E96680

6. Tighten to 62 Nm.

E96679

7. Install the engine rear undershield.
For additional information, refer to: [Engine Rear Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

8.  CAUTION: Calibrate the electric park brake using Jaguar

approved diagnostic system. If the Jaguar approved diagnostic system is not available disconnect the battery for approximately 30 seconds, the vehicle will then prompt the driver to carry out the calibration procedure as per the vehicle hand book on re-connection.

Calibrate the electric parking brake (EPB) using the diagnostic tool.

Hydraulic Brake Actuation - Hydraulic Brake Actuation - Component

Location

Description and Operation

- NOTE: RHD (right-hand drive) installation shown, LHD (left-hand drive) installation similar.

Component Location

E93574

ItemDescription

1	Brake master cylinder and fluid reservoir
2	Brake pedal
3	Brake pipes
4	Stoplamp switch
5	ABS (anti-lock brake system) module/ HCU (hydraulic control unit)
6	Brake booster

Hydraulic Brake Actuation - Hydraulic Brake Actuation - Overview

Description and Operation

Overview

The hydraulic brake system is a diagonally split dual line system. The system consists of a brake pedal, vacuum brake booster, brake master cylinder assembly, [HCU \(hydraulic control unit\)](#), hydraulic pipes and brake hoses.

Brake pipes from the master cylinder supply pressure to the brake calipers at the four corners of the vehicle via the [HCU](#). Braided steel hoses are used to connect the brake pipes to the front and rear brake calipers.

Hydraulic Brake Actuation - Hydraulic Brake Actuation - System Operation and Component Description

Description and Operation

System Operation

When the brake pedal is pressed, the front push rod in the brake booster pushes the master cylinder primary piston along the bore of the housing. This produces pressure in the primary pressure chamber which, in conjunction with the primary spring, overcomes the secondary spring and simultaneously moves the secondary piston along the bore. The initial movement of the pistons away from the piston stops closes the primary and secondary center valves in the master cylinder. Further movement of the pistons then pressurizes the fluid in the primary and secondary chambers and thus the brake circuits. The fluid in the chambers behind the pistons is unaffected by the movement of the pistons and can flow unrestricted through the inlet ports between the chambers and the reservoir.

Pressurized fluid enters the [HCU \(hydraulic control unit\)](#), which is mounted on the front of the [ABS \(anti-lock brake system\)](#) module. The [HCU](#) modulates the supply of pressurized fluid to the brakes under control of the [ABS](#) module. Refer to: [Anti-Lock Control - Stability Assist](#) (206-09 Anti-Lock Control - Stability Assist, Description and Operation).

Component Description

Brake Pedal

E93526

The brake pedal is mounted to a bracket attached to the rear side of the engine bulkhead. The bracket also contains the accelerator pedal. A clevis pin connects the brake pedal to the input push rod of the brake booster and master cylinder assembly.

The stoplamp switch is mounted in the brake pedal bracket and is operated by the brake pedal.

Brake Master Cylinder and Fluid Reservoir

E93575

ItemDescription

1	Brake fluid level switch electrical connector
2	Brake fluid reservoir cap
3	Brake fluid reservoir
4	Primary circuit inlet port
5	Brake master cylinder
6	Torx bolt
7	Primary circuit outlet
8	Secondary circuit outlet
9	Secondary circuit inlet port
10	Reservoir to master cylinder seal (2 off)

The brake booster and master cylinder assembly is fitted in the engine compartment. The brake master cylinder housing consists of two hydraulic chambers containing two pistons in tandem. The primary piston (adjacent to the brake booster) produces pressure for the primary braking circuit and this pressure acts on the secondary piston and hence creates pressure in the secondary circuit. A brake fluid reservoir is mounted on top of the master cylinder to provide a supply of brake fluid to the brake system. The reservoir cap is fitted with a brake fluid level switch.

Brake Fluid Level Switch

The brake fluid level switch is located in the fluid reservoir and is hardwired to the instrument cluster. When the level of fluid in the reservoir reaches a predetermined low level, the switch contacts close and provide a signal feed back to the instrument cluster. On receipt of the signal, the brake fluid red warning indicator will illuminate and 'BRAKE FLUID LOW' will be displayed in the message center.

ABS Module

E93576

ItemDescription

1	LH (left-hand) front brake
2	RH (right-hand) rear brake
3	LH rear brake
4	RH front brake
5	Primary circuit inlet port
6	Secondary circuit inlet port

The [ABS](#) module is located in the passenger side, rear engine bay and incorporates the [HCU](#). The [HCU](#) is a four channel unit that modulates the supply of hydraulic pressure to the brakes under control of the [ABS](#) module.

The primary and secondary outlets of the master cylinder are connected to the primary and secondary circuits within the [HCU](#). The primary circuit in the [HCU](#) has separate outlet ports to the [RH](#) front and [LH](#) rear brakes. The secondary circuit in the [HCU](#) has separate outlet ports to the [LH](#) front and [RH](#) rear brakes.

CAUTION: The [ABS](#) module and the [HCU](#) are a single unit and must not be separated.

Hydraulic Brake Actuation - Brake Fluid Reservoir

Removal and Installation

Removal

CAUTION: If brake fluid is spilled on the paintwork, the affected area must be immediately washed down with cold water.

1. Remove the brake fluid reservoir cap.

2. Disconnect the brake fluid level electrical connector.

3. Using a suitable suction device drain the brake fluid reservoir.

4. Remove the brake fluid reservoir seals.

Installation

1. Remove and discard the O-ring seals.

E52760

1. To install, reverse the removal procedure.

- Tighten to 8 Nm.
- Fill the brake fluid reservoir to the MAX mark.

Hydraulic Brake Actuation - Brake Master Cylinder

Removal and Installation

Removal

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Remove the cowl vent screen.
For additional information, refer to: [Cowl Vent Screen](#) (501-02 Front End Body Panels, Removal and Installation).

3.  **CAUTION:** Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

Remove the brake fluid reservoir.

For additional information, refer to: [Brake Fluid Reservoir](#) (206-06 Hydraulic Brake Actuation, Removal and Installation).

4. Remove the brake booster vacuum line from the brake vacuum pump.

5.  **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.

Disconnect the master cylinder brake pipes.

6. Release the fuse box.

7. Remove the brake master cylinder.

Installation

1. To install, reverse the removal procedure.

- Install new O-ring seals.

2. Tighten to 25 Nm.

E30338

3. Tighten to 17 Nm.

VUJ0005114

4. Bleed the brake system.

For additional information, refer to: [Brake System Bleeding](#) (206-00 Brake System - General Information, General Procedures).

Power Brake Actuation - Brake Booster - Overview

Description and Operation

Overview

Power assistance for the braking system is provided by a vacuum brake booster. The unit increases the input load by a ratio of 6.2 : 1 and is secured to the driver's side of the engine compartment bulkhead by four studs and nuts.

The booster and master cylinder assembly is fitted in the engine compartment. A two piece plastic vacuum pipe connects the brake booster to the inlet manifold to provide the necessary vacuum to the booster. The connection into the brake booster has a non return valve to maintain the vacuum level in the booster and also prevent fuel vapor from entering the brake booster.

The input push rod within the brake booster is connected to the brake pedal lever. Initially, any effort applied by the driver is increased by pedal ratio which is transferred to the input push rod. This load is further increased by the booster. The increased load is applied to the primary piston of the master cylinder via the output pushrod of the booster. Hydraulic pressure in the master cylinder is then applied to the brakes.

Refer to: [Hydraulic Brake Actuation](#) (206-06 Hydraulic Brake Actuation, Description and Operation).

Power Brake Actuation - Brake Vacuum Pump 2.7L V6 - TdV6

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the engine cover.
For additional information, refer to: [Engine Cover - 2.7L Diesel](#) (501-05, Removal and Installation).
3. Remove the secondary bulkhead center panel.
For additional information, refer to: [Secondary Bulkhead Center Panel](#) (501-02 Front End Body Panels, Removal and Installation).
4. Remove the engine compartment brace.

5. Disconnect both vacuum lines from the brake vacuum pump.

6. Remove the crankcase breather pipe bracket retaining nut.

7. Remove the brake vacuum pump retaining stud.

8. Remove the high pressure fuel pipe bracket retaining bolt.

9. NOTE: Remove and discard the O-ring seal.

Remove the brake vacuum pump.

- Remove the gasket.

Installation

1. NOTE: Install a new O-ring seal.

To install, reverse the removal procedure.

- Install a new gasket.
- Apply silicone gasket sealant or equivalent meeting Jaguar specification.
- The application of sealant must be 10 mm square in two places. Install the brake vacuum pump immediately after applying the sealant.
- The brake vacuum pump should be fitted directly to the engine without smearing the sealant.
- Make sure that the drive coupling is aligned with camshaft coupling.

Anti-Lock Control - Stability Assist - Anti-Lock Control - Stability Assist - Overview

Description and Operation

Overview

The [ABS \(anti-lock brake system\)](#) and DSC (dynamic stability control) system features a Bosch modulator, which is an integrated four-channel [HCU \(hydraulic control unit\)](#) and [ABS](#) module. The unit is located in the rear of the engine compartment on the passenger side, and is installed in the brake hydraulic circuit between the brake master cylinder and the four brake calipers.

The [ABS](#) module is connected to the high speed [CAN \(controller area network\)](#) bus, and actively interacts with other vehicle system control modules and associated sensors to receive and transmit current vehicle operating information.

When required, the [ABS](#) module will actively intervene and operate the [HCU](#) during braking or vehicle maneuvers to correct the vehicle attitude, stability, traction or speed. During incidents of vehicle correction, the [ABS](#) module may also request the [ECM \(engine control module\)](#) to control engine power in order to further stabilize and correct the vehicle.

To provide full system functionality, the [ABS](#) and DSC system comprise the following components:

- DSC switch.
- Four wheel speed sensors.
- Steering angle sensor.
- Yaw rate and lateral acceleration sensor.
- Stoplamp switch.
- Instrument cluster indicator lamps.
- Integrated [ABS](#) module and [HCU](#).
- Brake booster vacuum sensor (3.0L vehicles only).

Two variants of [ABS](#) module are available, Bosch ESP®8.1 and Bosch ESP®plus8.1. The Bosch ESP®plus8.1 system is fitted to vehicles with ACC (adaptive cruise control) and incorporates a new feature to Jaguar known as 'electronic brake prefill'.

Electronic brake prefill, senses any rapid throttle lift off, activating a small brake hydraulic pressure build-up of approximately 3 to 5 bar (43.5 to 72.5 lbf/in²) in anticipation of the brakes being applied. This application produces a quicker brake pedal response and consequently slightly shorter stopping distances. When the [ECM](#) detects rapid throttle lift off it signals the [ABS](#) module which controls the [HCU](#) to apply a low brake pressure to assist in a quicker brake application.

- **NOTE:** All vehicles with ACC are supported by the Bosch ESP®plus8.1 system.

The [ABS](#) provides the following brake functions that are designed to assist the vehicle or aid the driver:

- [ABS](#).
- DSC, including Trac DSC.
- CBC (corner brake control).
- [EBD \(electronic brake force distribution\)](#).
- ETC (electronic traction control).
- [EBA \(emergency brake assist\)](#).
- EDC (engine drag-torque control).
- Understeer control.
- Electronic brake prefill (vehicles with ACC only).
- Brake vacuum assist (3.0L vehicles only).

All the brake functions listed are automatically active when the ignition is in power mode and the engine is running. The DSC system can be selected to off using the DSC switch.

WARNING: Although the vehicle is fitted with DSC, it remains the drivers responsibility to drive safely according to the prevailing conditions.

System Operation

Anti-Lock Brake System

[ABS](#) controls the speed of all road wheels to ensure optimum wheel slip when braking at the adhesion limit. The wheels are prevented from locking to retain effective steering control of the vehicle.

The brake pressures are modulated separately for each wheel. Rear brake pressures are controlled to maintain rear stability on split friction surfaces.

Dynamic Stability Control

DSC (dynamic stability control) uses brakes and powertrain torque control to assist in maintaining the yaw stability of the vehicle. While the ignition is energized the DSC function is permanently enabled, unless selected off using the DSC switch.

DSC enhances driving safety in abrupt maneuvers and in under-steer or over-steer situations that may occur in a bend. The [ABS](#) module monitors the yaw rate and lateral acceleration of the vehicle, steering input and individual wheel speeds, then selectively applies individual brakes and signals for powertrain torque adjustments to reduce under-steer or over-steer conditions.

In general:

- In an under-steer situation the inner wheels are braked to counteract the yaw movement towards the outer edge of the bend.
- In an over-steer situation the outer wheels are braked to prevent the rear end of the vehicle from pushing towards the outer edge of the bend.

The [ABS](#) module monitors the tracking stability of the vehicle using inputs from the wheel speed sensors, the steering angle sensor, and the yaw rate and lateral acceleration sensor. The tracking stability is compared with stored target data. Whenever the tracking stability deviates from the target data, the [ABS](#) module intervenes by applying the appropriate control strategy.

The following interactions occur in an intervention situation:

- High speed [CAN](#) signal to the [ECM](#), to reduce engine torque.
- Application of braking to the appropriate corner of the vehicle.

Trac DSC

TracDSC is an alternative setting of DSC with reduced system interventions. With TracDSC engaged, traction may be somewhat increased, although stability may be reduced compared to normal DSC. TracDSC is intended for use only on dry tarmac, by suitably experienced drivers and should not be selected for other surfaces or by drivers with insufficient skill and training to operate the vehicle safely with the TracDSC function engaged.

The less restrictive TracDSC setting may be preferred, for example, by expert drivers engaged in high performance driving on dry Tarmac surfaces such as tracks and circuits.

Switching between DSC and Trac DSC:

- Press and hold the DSC switch for less than 10 seconds.
 - The message center will temporarily display either **Trac DSC** or **DSC ON**.
 - The warning indicator in the instrument panel will illuminate while Trac DSC is selected.
 - The warning indicator will flash when DSC or Trac DSC is active.
- **NOTE:** If cruise control is engaged, it will automatically disengage if DSC activates.

Refer to: Speed Control (310-03 Speed Control - 2.7L V6 - TdV6, Description and Operation).

Corner Brake Control

CBC (corner brake control) influences the brake pressures, below and within DSC and [ABS](#) thresholds, to counteract the yawing moment produced when braking in a corner. CBC produces a correction torque by limiting the brake pressure on one side of the vehicle.

Electronic Brake Force Distribution

[EBD \(electronic brake force distribution\)](#) limits the brake pressure applied to the rear wheels. When the brakes are applied, the weight of the vehicle transfers forwards, reducing the ability of the rear wheels to transfer braking effort to the road surface. This may cause the rear wheels to slip and make the vehicle unstable.

[EBD](#) uses the [ABS](#) braking hardware to automatically optimize the pressure to the rear brakes, below the point where [ABS](#) is normally invoked.

- **NOTE:** Only the rear brakes are controlled by the [EBD](#) function.

Electronic Traction Control

ETC (electronic traction control) attempts to optimize forward traction by reducing engine torque, or by applying the brake of a spinning wheel until traction is regained.

ETC is activated if an individual wheel speed is above that of the vehicle reference speed (positive slip) and the brake pedal is not pressed. The brake is applied to the spinning wheel, allowing the excess torque to be transmitted to the non-spinning wheel through the drive line. If necessary, the [ABS](#) module also sends a high speed [CAN](#) bus message to the [ECM](#) to request a reduction in engine torque.

When the DSC function is selected off using the DSC switch, the braking and engine torque reduction features are both disabled, except when the JaguarDrive control is in winter mode. When the JaguarDrive control is in winter mode, selecting the DSC function off retains the braking and engine torque reduction features, but reduces intervention levels compared to DSC and Trac DSC modes.

Emergency Brake Assist

[EBA \(emergency brake assist\)](#) assists the driver in emergency braking situations by automatically increasing the applied braking effort. The [ABS](#) module invokes [EBA](#) when:

- The brake pedal is rapidly pressed.
- The brake pedal is pressed hard enough to bring the front brakes into [ABS](#) operation.

When the brake pedal is rapidly pressed, the [ABS](#) module increases the hydraulic pressure to all of the brakes until the threshold for [ABS](#) operation is reached. This action applies the maximum braking effort for the available traction. The [ABS](#) module monitors for the sudden application of the brakes, using inputs from the brake pedal switch and from the pressure sensor within the [HCU \(hydraulic control unit\)](#). With the brake pedal pressed, if the rate of increase of hydraulic pressure exceeds the predetermined limit, the [ABS](#) module invokes emergency braking.

When the brake pedal is pressed hard enough to bring the front brakes into [ABS](#) operation, the [ABS](#) module increases the hydraulic pressure to the rear brakes up to the [ABS](#) threshold.

[EBA](#) operation continues until the driver releases the brake pedal, sufficiently for the hydraulic pressure in the [HCU](#) to drop below a threshold value stored in the [ABS](#) module.

Engine Drag-Torque Control

EDC (engine drag-torque control) prevents wheel slip caused by any of the following:

- A sudden decrease in engine torque when the accelerator is suddenly released.
- A downshift using the Jaguar sequential shift function on automatic transmission vehicles.

When the [ABS](#) module detects the onset of wheel slip without the brakes being applied, the [ABS](#) module signals the [ECM](#) via the high speed [CAN](#) bus to request a momentary increase in engine torque.

Understeer Control

Understeer Logic Control is a proactive system which monitors the vehicle for understeer by comparing signals from the yaw rate and lateral acceleration sensor with signals from the steering angle sensor and wheel speed sensors.

When the [ABS](#) module detects the onset of understeer, the [ABS](#) module signals the [ECM](#) via the high speed [CAN](#) bus to request a decrease in engine torque. At the same time the [ABS](#) module will control the [HCU](#) to apply brake pressure to the relevant wheels to correct the understeer.

Electronic Brake Prefill (Vehicles With ACC Only)

Electronic brake prefill (Bosch ESP®plus8.1), senses any rapid throttle lift off, activating a small brake hydraulic pressure build-up of approximately 3 to 5 bar (43.5 to 72.5 lbf/in²) in anticipation of the brakes being applied.

This application produces a quicker brake pedal response and consequently slightly shorter stopping distances. The system supports vehicles with ACC (adaptive cruise control).

When the [ABS](#) module detects rapid throttle lift off (from the signals received from the [ECM](#) over the high speed [CAN](#) bus), it controls the [HCU](#) to apply a low brake pressure to assist in a quicker brake application.

Brake Vacuum Assist (3.0L Vehicles Only)

Operation of Brake Vacuum Assist generally occurs at the beginning of an ignition cycle when brake booster vacuum levels are low; refer to Brake Booster Vacuum sensor, below.

Brake vacuum assist operation will be recognized by the driver experiencing a vibrating brake pedal and slight modulator noise. This will be similar to that experienced when [ABS](#) system is operating.

As the engine warms up, Brake Vacuum Assist operation will become less frequent. However, it can become more active when vacuum levels are low due to driving at high-altitudes, or during frequent heavy-braking.

Noise levels during Brake Vacuum Assist may vary with initial system activity being the loudest observed. In some circumstances initial activity may be interpreted as a 'thump' noise, particularly if there is no immediate and significant Brake Vacuum Assist functionality.

In this circumstance system behavior is normal and should not be a cause for fault investigation.

Component Description

Dynamic Stability Control Switch

ItemDescription

1 DSC switch

The DSC switch is mounted in the floor console adjacent to the JaguarDrive selector.

DSC becomes active whenever the engine is running. A momentary press of the switch allows the driver to toggle between the standard DSC settings and the optimized 'Trac DSC' settings. The message 'Trac DSC' or 'DSC on' will temporarily be displayed in the instrument cluster message center. The amber DSC warning indicator in the instrument cluster remains illuminated while 'Trac DSC' is selected.

The DSC can be switched off by pressing and holding the switch for more than 10 seconds.

In each case the message 'DSC OFF' will be displayed in the instrument cluster message center to confirm DSC has been switched off. The amber DSC warning indicator in the instrument cluster will remain illuminated. The system can be switched back on again by simply pressing and releasing the switch. The message 'DSC ON' will then temporarily appear in the instrument cluster message center to confirm the system is on.

• **NOTE:** Switch requests may be delayed if the switch is pressed while a DSC operation is taking place. The switch request will be displayed in the instrument cluster but the [ABS](#) module will not initiate any stability changes until it is safe to do so.

If a fault is detected with the DSC switch, the [ABS](#) module defaults to the 'DSC ON' setting and any switch requests are ignored.

WARNING: It is recommended that when using snow chains, Trac DSC is switched off and JaguarDrive control winter mode is selected.

Wheel Speed Sensors

E93755

ItemDescription

1	Front wheel speed sensor
2	Rear wheel speed sensor

An active wheel speed sensor is installed in each wheel hub to provide the [ABS](#) module with a rotational speed signal from each road wheel. The head of each front wheel speed sensor is positioned close to a magnetic encoder ring incorporated into the inboard seal of the wheel bearing. The head of each rear wheel speed sensor is positioned close to a magnetic encoder ring incorporated into the rear wheel bearing assembly. Each encoder ring contains 46 north and south poles. A fly lead connects each sensor to the vehicle harness.

The wheel speed sensors each have a signal and a return connection with the [ABS](#) module. When the ignition is ON the [ABS](#) module supplies a signal feed to the wheel speed sensors and monitors the return signals. Any rotation of the road wheels induces current fluctuations in the return signals, which are converted into individual wheel speeds and overall vehicle speed by the [ABS](#) module.

The [ABS](#) module broadcasts the individual wheel speeds and the vehicle speed on the high speed [CAN](#) bus for use by other systems, although vehicle speed information to the roof opening panel motor/module is a hardwired connection.

If a wheel speed sensor fault is detected by the [ABS](#) module, 'ABS FAULT' will be displayed in the instrument cluster message center and an amber warning indicator will illuminate.
 Refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

As the wheel speed sensors are active devices, a return signal is available when the road wheels are not rotating. This enables the [ABS](#) module to check the condition of the speed sensors while the vehicle is stationary.

Steering Angle Sensor

The steering angle sensor measures the steering wheel angle and the rate of change of the steering wheel angle. These measurements are received by the [ABS](#) module and broadcast on the high speed [CAN](#) bus for use by other systems.

The steering angle sensor is mounted on the steering column upper shroud mounting bracket, immediately behind the multifunction switches, and is secured by 2 screws. A fly lead connects the sensor to the passenger compartment wiring harness via a 4 pin multiplug.

The sensor is housed in a 'U' shaped plastic casing and contains two offset [LED \(light emitting diode\)](#)s facing two detectors.

An encoder ring is mounted on the inner steering column shaft and intersects the [LEDs](#) and detectors. The encoder ring contains 60 slots which break and restore the light beams between the [LEDs](#) and the detectors as the steering wheel is rotated. The [ABS](#) module is able to determine the direction of rotation of the steering wheel by monitoring when the light beams change state. The [LEDs](#) and detectors are mounted in such a way that only one beam will change state, either to broken or restored, at any one time.

The center (straight ahead) position of the steering wheel has to be learned by the [ABS](#) module every time the ignition is switched ON. The steering angle sensor is unable to determine the center position so inputs from the yaw rate and lateral acceleration sensor and wheel speed signals are also used by the [ABS](#) module to help it perform this process. If extreme weather conditions are present, for example ice causing extreme wheel spin or understeer/oversteer, the [ABS](#) module may not be able to determine the center position of the steering wheel. In this situation 'DSC NOT AVAILABLE' will be displayed in the instrument cluster message center and the amber warning indicator will illuminate. Refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

'DSC NOT AVAILABLE' will also be displayed if the [ABS](#) module detects a steering angle sensor fault. The amber warning indicator will illuminate until the fault is rectified.

Yaw Rate and Lateral Acceleration Sensor

E93757

The yaw rate and lateral acceleration sensor is mounted on the rear parcel shelf. The sensor is secured by two screws and connects to the vehicle wiring via a four pin multiplug.

When the ignition is ON, the sensor receives a power feed from the [CJB](#). The ground path for the sensor is located behind the left hand rear seat back. The sensor measures the yaw rate and lateral acceleration of the vehicle, providing values to the [ABS](#) module via a dedicated, private high speed [CAN](#) bus connection. The [ABS](#) module broadcasts these values on the high speed [CAN](#) bus for use by other systems.

If a sensor fault is detected by the [ABS](#) module, 'DSC NOT AVAILABLE' will be displayed in the instrument cluster message center and the amber warning indicator will illuminate.

Refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

Stoplamp Switch

E93526

The stoplamp switch is mounted on the brake pedal box and is connected to the vehicle harness via a four pin multiplug.

When the brake pedal is pressed, the switch contacts close. This allows a hard wired signal feed to be sent to the [ECM](#). A stoplamp switch status message is then sent from the [ECM](#) to the [ABS](#) module on the high speed [CAN](#) bus. The [ABS](#) module is then able to control braking force accordingly in conjunction with the [HCU](#).

- **NOTE:** The stoplamp switch also forms part of the speed control system.

For additional information, refer to:

Speed Control (310-03 Speed Control - 2.7L V6 - TdV6, Description and Operation),
Speed Control (310-03 Speed Control - 3.0L NA V6 - AJ27, Description and Operation),
[Speed Control](#) (310-03 Speed Control - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

Instrument Cluster Warning Indicators

E93782

ItemDescription

1	ABS warning indicator (USA only)
2	ABS warning indicator (Canada and Mexico only)
3	ABS warning indicator (all except USA, Canada and Mexico)
4	DSC warning indicator
5	Brake warning indicator (USA only)
6	Brake warning indicator (all except USA)

The instrument cluster and message center contains warning indicators and warning messages to display the operating status of the anti-lock control - stability assist functions. The warning indicators and messages provide a visual notification of either a system warning or information indication to the driver. There are three warning indicators on the instrument cluster, which vary dependant on market, and several types of message relating to the anti-lock control - stability assist functions. The DSC OFF message is accompanied by an audible warning.

The following anti-lock control - stability assist warning indicators are installed in the instrument cluster:

- An amber [ABS](#) warning indicator.
- A red brake warning indicator.
- An amber DSC warning indicator.

Refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation) / [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

ABS Module

E93576

ItemDescription

1	LH front brake
2	RH rear brake
3	LH rear brake
4	RH front brake
5	Primary inlet
6	Secondary inlet

The [ABS](#) module is located in the passenger side, rear engine bay and incorporates the [HCU](#). The module is mounted on the rear face of the [HCU](#), which it uses to control all braking and stability functions by modulating hydraulic pressure to the individual wheel brakes.

Two types of [ABS](#) modules are available; one for vehicles with standard Speed Control, one for vehicles fitted with Adaptive Speed Control.

If an [ABS](#) modulator fault is detected, 'ABS FAULT' will be displayed in the instrument cluster message center and the amber warning indicator will illuminate.

Refer to: [Information and Message Center](#) (413-08 Information and Message Center, Description and Operation).

CAUTION: The [ABS](#) module and the [HCU](#) comprise a single unit and must not be separated.

Hydraulic Control Unit

The [HCU](#) is a four channel unit, secured to a mounting bracket located in the passenger side, rear engine bay. The [HCU](#) modulates the supply of hydraulic pressure to the brakes under the control of the [ABS](#) module.

Refer to: [Hydraulic Brake Actuation](#) (206-06 Hydraulic Brake Actuation, Description and Operation).

Brake Booster Vacuum Sensor (3.0L Vehicles Only)

E93758

ItemDescription

- 1 Brake booster vacuum sensor

When the brake booster vacuum is low the [ABS](#) control module will raise the braking system's hydraulic pressure to compensate for the brake booster's vacuum deficiency. This function will operate until the brake booster's vacuum has been replenished. See Brake Vacuum Assist above.

The brake booster vacuum sensor, mounted on the brake booster, provides vacuum pressure information to the [ABS](#) module. The sensor monitors the vacuum pressure in both chambers of the brake booster, providing vacuum pressure values to the [ABS](#) module via hard wired connections.

The brake booster vacuum sensor receives a power feed from the [ABS](#) module, which also provides a ground path for the sensor.

Anti-Lock Control - Stability Assist - Anti-Lock Control - Stability Assist

Diagnosis and Testing

Principle of Operation

For a detailed description of the Anti-Lock Control - Stability Assist system, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (206-09 Anti-Lock Control - Stability Assist)

[Anti-Lock Control - Stability Assist](#) (Description and Operation),
[Anti-Lock Control - Stability Assist](#) (Description and Operation),
[Anti-Lock Control - Stability Assist](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Confirm if the Anti-Lock Brake System (ABS) warning light was illuminated, or still is.

• **NOTE:** An intermittent fault may allow the warning light to go off. This does not necessarily mean the fault is not present. Some warnings will appear to clear when the ignition is cycled. This is often because the warning has flagged as a result of one of the vehicle's on-board diagnostic routines having run to detect the fault. If the same routine is not run when the ignition status is set to **ON**, the warning will not re-flag until the routine does run.

3. 3. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Brake fluid level ● Vacuum system ● Wheel speed sensor installation ● Wheel speed sensor air gap ● Magnetic pulse wheel(s) (damaged/contaminated) ● Steering angle sensor ● Yaw rate sensor and accelerometer cluster installation ● Incorrect wheel or tire size 	<ul style="list-style-type: none"> ● Warning light operation ● Fuses ● Wheel speed sensors ● Connectors/Pins ● Harnesses ● Steering wheel rotation sensor ● Yaw rate sensor and accelerometer cluster ● Booster pressure sensor ● Hydraulic Control Unit (HCU)

4. 4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
5. 5. If the cause is not visually evident check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

• **NOTE:** If the Hydraulic Control Unit (HCU) is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new HCU.

• **NOTE:** Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give additional information read by the manufacturer-approved diagnostic system).

• **NOTE:** When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• **NOTE:** Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• **NOTE:** If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action
C0021-09	Brake Booster Performance	<ul style="list-style-type: none"> ● No vacuum available from engine due to split/leaking hose etc ● Brake booster servo has failed due to lack of vacuum 	<ul style="list-style-type: none"> ● Check integrity of brake booster vacuum hose. Check and install a new brake booster as required
C0030-38	Left Front Tone Wheel - signal frequency incorrect	<ul style="list-style-type: none"> ● Left front magnetic pulse ring damaged/contaminated ● Incorrect component installed 	<ul style="list-style-type: none"> ● Check the left front magnetic pulse ring for damage or contamination. Clean or replace as required. If no damage/contamination found, suspect wheel speed sensor. Refer to the

DTC	Description	Possible Cause	Action
C003A-64	Right Rear Wheel Speed Sensor - signal plausibility failure	<ul style="list-style-type: none"> ● Incorrect wheels/tyres installed ● Electrical wiring harness fault ● EMC influences on left rear wheel speed sensor and supply line ● Magnetic pulse wheel damaged/contaminated, de-magnetised ● Sensor internal fault 	<ul style="list-style-type: none"> ● Check the correct wheels and tyres are installed. Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for intermittent short to power, or ground. Check for EMC influences on the speed sensor and circuits. Check magnetic pulse wheel for damage/contamination and de-magnetisation. Repair Wiring harness, install a new sensor or wheel bearing as required. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C003B-11	Right Rear Wheel Speed Sensor Supply - circuit short to ground	<ul style="list-style-type: none"> ● Electrical wiring harness fault ● Sensor internal fault 	<ul style="list-style-type: none"> ● Refer to the electrical circuit diagrams and check the wheel speed sensor circuit for short to ground. Repair harness as required. If no harness fault found, suspect wheel speed sensor. Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0047-16	Brake Booster Pressure Sensor - circuit voltage below threshold	<ul style="list-style-type: none"> ● Brake booster pressure sensor supply circuit - voltage below threshold ● HCU failure 	<ul style="list-style-type: none"> ● Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check brake booster pressure sensor power supply for short to ground. Check and install a new HCU as required, refer to the new module/component installation note at the top of the DTC Index
C0047-1C	Brake Booster Pressure Sensor - circuit voltage out of range	<ul style="list-style-type: none"> ● Brake booster pressure sensor supply circuit - voltage out of range 4.5v-5.3v ● Brake booster pressure sensor failure ● HCU failure 	<ul style="list-style-type: none"> ● Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check brake booster pressure sensor power supply for short, high resistance. Establish if sensor or HCU is at fault. Check and install a new brake booster pressure sensor or HCU as required, refer to the new module/component installation note at the top of the DTC Index
C0047-29	Brake Booster Pressure Sensor - signal invalid	<ul style="list-style-type: none"> ● Brake booster pressure sensor signal 1 circuit - short to ground, power, open circuit ● Brake booster pressure sensor signal 2 circuit - short to ground, power, open circuit ● Brake booster pressure sensor failure 	<ul style="list-style-type: none"> ● Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check brake booster signal 1 and 2 circuits for short to ground, power, open circuit. Clear DTC and re-test. If DTC remains, suspect the brake booster pressure sensor, check and install a new sensor as required, refer to the new module/component installation note at the top of the DTC Index. To validate the repair and extinguish the lamps, start the engine and apply the foot brake
C0047-62	Brake Booster Pressure Sensor - signal compare failure	<ul style="list-style-type: none"> ● NOTE: Fault detected during braking event ● Brake booster pressure sensor signal circuits 1 and 2 - shorted together 	<ul style="list-style-type: none"> ● Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check brake booster pressure sensor signal circuits 1 and 2 for shorting together. Repair any harness faults found and retest. To validate the repair and extinguish the lamps, start the engine and apply the foot brake
C0047-64	Brake Booster Pressure Sensor - signal plausibility failure	<ul style="list-style-type: none"> ● NOTE: Fault detected during non-braking event ● Signal plausibility failure ● Electrical wiring harness fault ● Brake booster pressure sensor failure 	<ul style="list-style-type: none"> ● Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check brake booster signal 1 and 2 circuits for short to ground, power, open circuit or high resistance. Check connectors for damage or corrosion. Repair any harness faults found and retest. If DTC remains, suspect the brake booster pressure sensor, check and install a new sensor as required, refer to the new module/component installation note at the top of the DTC Index. To validate the repair and extinguish the lamps, start the engine and apply and release the foot brake
C0062-28	Longitudinal Acceleration Sensor - signal bias level out of range/zero adjustment failure	<ul style="list-style-type: none"> ● Yaw sensor insecurely mounted ● Yaw sensor fault 	<ul style="list-style-type: none"> ● Check the yaw sensor is securely mounted. If the mounting is secure suspect the yaw sensor, Refer to the Warranty Policy and Procedures manual if a module/component is suspect

DTC	Description	Possible Cause	Action
C0062-54	Longitudinal Acceleration Sensor - missing calibration	<ul style="list-style-type: none"> ● The longitudinal acceleration sensor has not been calibrated ● Mounting bracket bent/misaligned 	<ul style="list-style-type: none"> ● Check the longitudinal acceleration sensor has been calibrated ● If it has been calibrated check that the sensor is aligned correctly, check for bent mounting bracket ● To validate the calibration/repair, ignition on and wait 10 seconds. Check lamps remain extinguished
C0063-08	Yaw Rate Sensor - bus signal /message failures	<ul style="list-style-type: none"> ● Wiring harness fault ● Yaw sensor fault 	<ul style="list-style-type: none"> ● Refer to the electrical wiring diagrams and check the integrity of the power and ground supplies to the yaw sensor. Check the integrity of the bus connections. Repair any harness faults found and retest. If no harness faults are found suspect the yaw sensor, Refer to the Warranty Policy and Procedures manual if a module/component is suspect. To validate the repair, ignition on and wait 10 seconds. Check lamps remain extinguished.
C0063-14	Yaw Rate Sensor - circuit short to ground or open	<ul style="list-style-type: none"> ● Wiring harness fault ● Sensor fault 	<ul style="list-style-type: none"> ● Refer to the electrical wiring diagrams and check the high speed CAN circuit between the yaw sensor and the Anti-Lock Braking System Hydraulic Control Unit for short to ground or open circuit. Repair any harness faults found and retest. If no harness faults are found suspect the yaw sensor, Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0063-1C	Yaw Rate Sensor - circuit voltage out of range	<ul style="list-style-type: none"> ● Yaw rate sensor power distribution fault ● Wiring harness fault ● Yaw sensor internal fault 	<ul style="list-style-type: none"> ● Refer to the electrical wiring diagrams and check the power and ground supplies to the yaw sensor. Check power circuit for short to ground or open circuit. Check ground circuit for short to power or open circuit. Repair any harness faults found and retest. If no harness faults are found suspect the yaw sensor, Refer to the Warranty Policy and Procedures manual if a module/component is suspect ● To confirm the repair and extinguish the warning lamps, clear the DTC, cycle the ignition state to off, then return the ignition state to on and wait up to 10 seconds
C0063-27	Yaw Rate Sensor - signal rate of change	<ul style="list-style-type: none"> ● Yaw sensor insecurely mounted ● Yaw sensor connector insecure ● Wiring harness fault ● Yaw sensor fault ● Anti-Lock Braking System Hydraulic Control Unit fault 	<ul style="list-style-type: none"> ● Check the yaw sensor is securely mounted. Check the yaw sensor harness connector is securely located. Refer to the electrical wiring diagrams and check the power and ground supplies to the yaw sensor. Check circuits for intermittent open circuit or high resistance. Repair any harness faults found and retest. If no harness faults are found suspect the yaw sensor or Anti-Lock Braking System Hydraulic Control Unit, Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0063-28	Yaw Rate Sensor - signal bias level out of range/zero adjustment failure	<ul style="list-style-type: none"> ● Yaw sensor insecurely mounted ● Yaw sensor fault 	<ul style="list-style-type: none"> ● Check the yaw sensor is securely mounted. If the mounting is secure suspect the yaw sensor, Refer to the Warranty Policy and Procedures manual if a module/component is suspect
C0063-41	Yaw Rate Sensor - checksum error	<ul style="list-style-type: none"> ● Yaw sensor fault ● Anti-Lock Braking System Hydraulic Control Unit fault 	<ul style="list-style-type: none"> ● Replace the yaw sensor, clear the DTC and retest the system. If the DTC remains install a new Anti-Lock Braking System Hydraulic Control Unit. Refer to the Warranty Policy and Procedures manual if a module/component is suspect ● To confirm the repair and extinguish the warning lamps, clear the DTC, cycle the ignition state to off, then return the ignition state to on and wait up to 10 seconds
C0063-49	Yaw Rate Sensor - internal electronic failure	<ul style="list-style-type: none"> ● Yaw rate sensor internal electronic failure ● Wiring harness fault 	<ul style="list-style-type: none"> ● Refer to the electrical wiring diagrams and check the power and ground supplies to the yaw sensor. Repair any harness faults found and retest. If no harness faults are found suspect the yaw sensor, Refer to the Warranty Policy and Procedures manual if a module/component is suspect ● To confirm the repair and extinguish the warning lamps, clear the DTC, cycle the ignition state to off, then return the ignition state to on and wait up to 10 seconds

Anti-Lock Control - Stability Assist - Anti-Lock Brake System (ABS) Module

Removal and Installation

Removal

1. NOTE: The anti-lock braking system (ABS) module mounted to the hydraulic control unit (HCU) cannot be serviced separately. If the ABS module requires replacement, the unit must be replaced as a complete assembly.

Remove the HCU.

For additional information, refer to: Hydraulic Control Unit (HCU) (206-09, Removal and Installation).

Installation

1. Install the HCU.

For additional information, refer to: Hydraulic Control Unit (HCU) (206-09, Removal and Installation).

Anti-Lock Control - Stability Assist - Front Wheel Speed Sensor

Removal and Installation

Removal

1.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

3. **3.** NOTE: LH illustration shown, RH is similar.

E93482

4. **4.** NOTE: LH illustration shown, RH is similar.

E93483

5.  CAUTION: Note the fitted position of the component prior to removal.
 - NOTE: LH illustration shown, RH is similar.

Installation

1. 1. NOTE: LH illustration shown, RH is similar.

2. 2. NOTE: LH illustration shown, RH is similar.

3. **3.** NOTE: LH illustration shown, RH is similar.

Anti-Lock Control - Stability Assist - Rear Wheel Speed Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: The ignition must be switched off.
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Disconnect the wheel speed sensor electrical connector.

3.  **CAUTION:** Make sure that the harness retaining bracket is not removed. Failure to follow this instruction may result in damage to the harness.

- NOTE: Note the orientation of the clip.

Release the wiring harness grommet.

4.  CAUTION: Note the fitted position of the component prior to removal.

Remove the wheel speed sensor.

- Remove the retaining bolt.
- Release the wheel speed sensor.

Installation

1. NOTE: Make sure that the component is installed to the position noted on removal.

To install, reverse the removal procedure.

- Tighten to 6 Nm.

Anti-Lock Control - Stability Assist - Steering Wheel Rotation Sensor

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Refer to: [Clockspring](#) (501-20B Supplemental Restraint System, Removal and Installation).

3.

4.

Installation

1. To install, reverse the removal procedure.

Anti-Lock Control - Stability Assist - Yaw Rate Sensor and Accelerometer

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Refer to: [Parcel Shelf](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Torque: 6 Nm

4.  CAUTION: Make sure that all diagnostic trouble codes (DTCs) have been removed after the road test.
- NOTE: Make sure that this component is installed to the noted removal position.

Installation

1. To install, reverse the removal procedure.

Steering System - General Information -

Steering Linkage Specifications

Steering Linkage Free Play	Measurement (mm)	Measurement (in)
Free play (measured at the steering wheel rim)	0-6	0-0.24

Power Steering Pump Specifications

Item	Specification
Power steering pump relief pressure	106-114 bar

Lubricants, Fluids, Sealers and Adhesives

Item	Specification
Power steering fluid	Dextron 3

Steering System - General Information - Steering System

Diagnosis and Testing

Principle of Operation

For a detailed description of the steering system operation, refer to the relevant Description and Operation sections of the workshop manual. REFER to:

[Power Steering](#) (211-02 Power Steering, Description and Operation),
[Power Steering](#) (211-02 Power Steering, Description and Operation),

[Steering Column Switches](#) (211-05 Steering Column Switches, Description and Operation),
[Steering Column Switches](#) (211-05 Steering Column Switches, Description and Operation).

Inspection and Verification

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Tire condition/pressure ● Fluid level ● Leaks ● Security, condition and correct installation of suspension components ● Security, condition and correct installation of steering system components 	<ul style="list-style-type: none"> ● Fuses ● Harnesses for damage/corrosion ● Electrical connector(s) ● Damaged/corroded pins

CAUTION: If a steering gear assembly is returned under warranty with leaking output shaft seals, but there is also damage to the steering gear boot/boots the steering gear warranty will be invalid. This is due to the steering gear output shaft seals being damaged due to foreign materials entering the steering gear boot and damaging the steering gear output shaft seals thereafter.

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the concern is not visually evident, verify the symptom and refer to the symptom chart.

Symptom Charts

WARNING: It is not possible to CHECK the torque of a patchlock bolt, if the torque is suspected to be low, the bolt must be REMOVED/DISCARDED and a new bolt MUST be INSTALLED and torque to the correct value.

• NOTE: If the module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

Fluid Leakage

• NOTE: Confirm the location of the fluid leak. CLEAN the area of the leak, inspect the area and confirm the exact position. Ensure the fluid is not from another system on the vehicle.

Symptom	Possible Causes	Action
● Power steering fluid leakage	● Overfilled system	● Correct the fluid level as required
	● Steering gear	● Check and install new steering gear as required, refer to the new module/component installation note at the top of the Symptom Charts
	● Damaged fluid cap/reservoir	● Check and install a new fluid cap/reservoir as required

<ul style="list-style-type: none"> ● Shake - condition where vertical vibration of the steering wheel/column occurs (not oscillation which is Nibble) 	<ul style="list-style-type: none"> ● NOTE: Vibration smooths out after several miles of driving ● Road wheel imbalance due to tire flat-spotting 	<ul style="list-style-type: none"> ● Ensure tires installed are to Jaguar specification. Install new tires as required ● Check and adjust tire pressures to correct specification

Component Tests

Steering Linkage Inspection and Backlash (Free play) Check

 **CAUTION: Steering gear boots must be handled carefully to avoid damage. Use new clamps when installing steering gear boots.**

Inspect the boots for cuts, deterioration, twisting or distortion. Check the steering gear boots to make sure they are tight. Install new boots or clamps as required.

• **NOTE: The following steps must be carried out with assistance.**

1. With the wheels in the straight ahead position, gently turn the steering wheel to the left and the right to check for free play.
2. Free play should be between 0 and 6 mm (0 and 0.24 in) at the steering wheel rim. If the free play exceeds this limit, either the ball joints are worn, the lower steering column joints are worn or the backlash of the steering gear is excessive.

 **CAUTION: DO NOT attempt to adjust the steering gear yoke. Failure to follow this instruction will invalidate the steering gear warranty.**

3. The backlash of the steering gear cannot be adjusted, install a new steering gear if excessive backlash is diagnosed.
4. Grasp the steering wheel firmly and move it up and down and to the left and right without turning the wheel to check for column bearing wear, steering wheel or steering column.

Power Steering Fluid Condition Check

1. Run the engine for 2 minutes.
2. Check the power steering fluid system level.
3. Observe the color and the odor. The color under normal circumstances should be dark reddish, not brown or black.
4. Using a suitable clean syringe extract a suitable amount of fluid from the reservoir.
5. Allow the fluid to drip onto a facial tissue and examine the stain.
6. If evidence of solid material is found, the power steering fluid system should be drained for further inspection.
7. If fluid contamination or steering component failure is confirmed by the sediment in the power steering fluid system, refer to Steering Fault Diagnosis by Symptom Charts in this section.

Power Steering Pressure Test

Test Equipment

E32453

Item	Part Number	Description
1	211-011	Pressure Gauge Hose
2	211-011-08	Pump Return Hose
3	211-011-07	Pump Return Hose Connector
4	211-011-03/2	Test Equipment to High Pressure Hose Adaptor
5	211-011-03/1	Pump High Pressure Outlet to Hose Adaptor
6	211-011-02	Pump Adaptor to Control Valve Hose
7	211-011-01	Control Valve
8	211-011	Pressure Gauge
9	-	'O' Ring Seal

The measurement of the maximum system pressure, (which is governed by the pressure relief valve) is achieved by inserting the Service Tool (pressure gauge and adaptors) into the fluid circuit of the power steering system. Run the engine at idle speed, turn the steering from lock to lock and read the maximum pressure recorded on the gauge.

Installing Test Equipment

To install the pressure test equipment:

- Place a suitable drain tray below the power steering pump.
- Install a hose clamp on the reservoir to pump hose prior to disconnecting any hoses, to avoid unnecessary loss of fluid.
- Disconnect the hose from the power steering pump high pressure outlet.
- Install the pump outlet to hose adaptor (5). Do not omit the 'O' ring seal (9).
- Connect the power steering pump adaptor to control valve hose (6) of the test equipment.
- Install the adaptor (4) in the high pressure hose previously removed from the power steering pump outlet.
- Connect the connector (3) of the test equipment hose (2) to the adaptor (4).
- Remove the hose clamp from the reservoir hose.
- Start the engine to check the system pressure.

With the control valve (7) OPEN and the engine idling, the following system pressures may be checked:

- During turning when static (dry parking pressure).
- When the steering is held on full lock (maximum system pressure or pressure relief).
- With the steering at rest (idle pressure or back pressure).

• CAUTIONS:

To avoid excessive heating of the power steering pump when checking the pressure, do not close the valve for more than 5 seconds maximum.

When checking the pump pressure DO NOT drive the vehicle with the test equipment installed.

With the control valve (7) CLOSED the power steering pump maximum output pressure can be checked.

Removing Test Equipment

To remove the test equipment:

- Install a hose clamp on the reservoir to power steering pump hose.
- Removing the test equipment is a reversal of the installation instructions.
- Install a new 'O' ring seal (9) to the power steering pump high pressure outlet to hose connection.
- Install the original hose to the power steering pump.
- Remove the clamp from the reservoir to the power steering pump hose.
- Top-up the reservoir fluid.
- Bleed the power steering system.
REFER to: [Power Steering System Bleeding](#) (211-00 Steering System - General Information, General Procedures).

Description of Terms

General Steering System Noises

Boom

Rhythmic sound like a drum roll or distant thunder. May cause pressure on the ear drum.

Buzz

Low-pitched sound, like a bee. Usually associated with vibrations.

Chatter

Rapidly repeating metallic sound.

Chuckle

Rapid noise that sounds like a stick against the spokes of a spinning bicycle wheel.

Chirp

High pitched rapidly repeating sound, like chirping birds.

Click

Light sound, like a ball point pen being clicked.

Click/Thump

Heavy metal-to-metal sound, like a hammer striking steel.

Grind

Abrasive sound, like a grinding wheel or sandpaper rubbing against wood.

Groan/Moan

Continuous, low-pitched humming sound.

Groan/Howl

Low, guttural sound, like an angry dog.

Hiss

Continuous sound like air escaping from a tire valve.

Hum

Continuous sound of varying frequencies, like a wire humming in the wind.

Knock

Heavy, loud repeating sound like a knock on a door.

Ping

Similar to knock, except at higher frequency.

Rattle

A sound suggesting looseness, such as marbles rolling around in a can.

Roar

Deep, long, prolonged sound like an animal, or winds and ocean waves.

Rumble

Low, heavy continuous sound like that made by wagons or thunder.

Scrape

Grating noise like one hard plastic part rubbing against another.

Squeak

High-pitched sound like rubbing a clean window.

Squeal

Continuous, high-pitched sound like running finger nails across a chalkboard.

Tap

Light, hammering sound like tapping pencil on edge of table. May be rhythmic or intermittent.

Whirr/Whine

High-pitched buzzing sound, like an electric motor or drill.

Whistle

Sharp, shrill sound, like wind passing a small opening.

Specific Steering System Noise Types

Belt Squeal

Belt squeal is a high frequency air-borne noise generated by slippage of the ribbed Vee belt on the power steering pump pulley. Squeal increases with system loading and at full lock.

Clonk

Clonk is a structure-borne noise heard as a loose-sounding rattle or vibration coming from the steering column. Clonk can be identified by driving and turning over cobblestones, rough roads, or high frequency bumps such as 25-50 mm tall tar strips. Clonk requires a tie-rod load impact.

Column Knock

Column knock is a loose-sounding rattle or vibration generated by the steering column shaft contacting other portions of the column assembly. The noise is both audible and tactile. Column knock is generated by driving over cobblestones or rough pavement. It is not necessary to turn the steering wheel to create this noise.

Column Rattle

Column rattle is a metallic sounding noise created when applying a highly impulsive force to the steering wheel. Column rattle is often used to combine the more general group of column noises including clonk and column knock. Column rattle noises can be caused by clonk, knock, loose column components, bonus parts etc. A series of parked, straight-line driving, and cornering tests should be carried out to isolate the source/sources.

Grinding/Scrape

Grinding is a low frequency noise in the column when the steering wheel is turned. It is generally caused by interference between moving components such as the steering wheel to steering column shroud.

Grunt (Squawk/Whoop)

Grunt is a 'honking' sound elicited when coming off one of the steering stops. Grunt is generally excited during parking manoeuvres with a low to medium speed steering input.

Hiss (Swish)

Hiss or Valve Hiss is a high-frequency sound coming from the steering gear when the system is loaded. It is a rushing or 'swish' noise that doesn't change frequency with RPM. Hiss is the general noise generated by the flow of hydraulic fluid through restrictions in the steering system. Restrictions include the rotary steering valve, power steering tubes, connectors, tuning orifices, etc. Hiss can be air-borne and structure-borne, but the structure-borne path through the steering intermediate shaft is usually dominant.

Moan (Groan)

Moan is the general structure-borne noise of the steering system. Moan is primarily transmitted to the driver via the body structure through the pump mount, engine mounts, power steering lines and power steering brackets. On some vehicles, moan is a loud humming noise, often present when the wheel is turned and the system is loaded. It may change frequency with engine RPM and if the system is loaded or unloaded.

Steering Gear Knock (Steering Gear Slap)

CAUTION: DO NOT attempt to adjust the steering gear yoke. Failure to follow this instruction will invalidate the steering gear warranty.

Steering gear knock is a rattle sound and steering wheel vibration caused by separation of the steering gear and pinion while driving over bumps. It is a structure-borne noise transmitted through the intermediate shaft and column. Steering gear knock can also be heard as a 'thump' or impact noise that occurs with the vehicle stationary when the steering wheel is released from a loaded position and allowed to return to rest. Noise occurs with the engine on or off.

Rattles

Rattles are noises caused by knocking or hitting of components in the steering system. Steering rattles can occur in the engine compartment, the suspension, or the passenger compartment. Rattles can be caused by loose components, movable and flexible components, and improper clearances.

Squeaks/Scrapes

Squeaks/Scrapes are noises due to friction or component rubbing anywhere in the steering system. Squeaks/Scrapes have appeared in steering linkages and joints, in column components and in column and steering wheel trim.

Weep

Weep is an air-borne noise, occasionally generated when turning the steering across lock at a constant rate. When present on a vehicle the noise, once initiated can often be maintained across a large proportion of the available steering movement.

Whistle

Whistle is similar to hiss but is louder and of a higher frequency. It is also more of a pure tone noise than hiss. Whistle is air-borne and is generated by a high flow rate of hydraulic fluid through a small restriction.

Zip

Zip noise is the air-borne noise generated by power steering pump cavitation when power steering fluid does not flow freely through the suction hose from the reservoir to the pump. Zip primarily occurs during cold weather at start-up.

Steering System Vibrations and Harshness

Buzz

Buzz is a tactile rotary vibration felt in the steering wheel when steering inputs are slow. Buzz can also be called a grinding feel and it is closely related to grunt and is caused by high system gain with low damping. Buzz is generally excited during parking manoeuvres with low to medium speed steering input.

Buzz (Electrical)

A different steering buzz can be caused by pulse width modulated (PWM) electric actuators used in variable assist steering systems. This buzz is felt by turning the ignition key to run without starting the engine and holding onto the steering wheel. In extreme cases, the buzz can be felt with the engine running also.

Column/Steering Wheel Shake

Column shake is a low frequency vertical vibration excited by primary engine vibrations.

Nibble (Shimmy)

Steering nibble is a rotary oscillation or vibration of the steering wheel, which can be excited at a specific vehicle speed. Nibble is driven by wheel and tire imbalance exciting a suspension recession mode, which then translates into steering gear travel and finally steering wheel nibble.

Shudder (Judder)

Shudder is a low frequency oscillation of the entire steering system (tire, wheels, steering gear and linkage, etc.) when the vehicle is steered during static-park or at low speeds. Shudder is very dependent on road surface.

Torque/Velocity Variation (Phasing/Effort Cycling)

Steering wheel torque variation occurring twice in one revolution is normally as a result of problems with the lower steering column (intermediate shaft), but foul conditions generally result in either constant stiffness or single point stiffness. Depending upon the orientation of the joints, the steering can feel asymmetric (torque falling off in one direction and rising in the other) or else it can simply have pronounced peaks and troughs as the steering moves from lock to lock.

Wheel Fight (Kick Back)

Wheel fight is excess feedback of sudden road forces through the steering system and back to the driver. It is evaluated at all vehicle speeds over cobblestones, rough roads, and potholes. The tires, wheels, and suspension generate forces into the steering systems. Steering friction, hydraulic damping, hydraulic compliance, mechanical compliance, steering ratio, and assist gain all affect how much is transmitted to the driver.

Steering System - General Information - Power Steering System Bleeding

General Procedures

1. Clean power steering fluid reservoir around the filler cap and fluid indicator.
 - Check the power steering fluid, if aerated, wait until fluid is free from bubbles then top-up reservoir to UPPER level mark with recommended fluid.

2.  **CAUTION:** Fluid must always be present in the reservoir during bleeding.

Remove the filler cap and fill to the MAX level mark.

- Install the reservoir filler cap.

3. Start the engine and allow to run for 10 seconds, stop the engine.
 - Check the power steering fluid, if aerated, wait until fluid is free from bubbles then top-up reservoir to UPPER level mark with recommended fluid.

4.  **CAUTION:** Do not hold steering on full lock for longer than 10 seconds.

Start the engine and turn steering fully lock to lock, stop the engine.

- Check and top-up power steering fluid level.

5. Start and run the engine for 2 minutes, turn the steering fully lock to lock.
 - Check and top-up power steering fluid level.

Power Steering - Power Steering - Overview

Description and Operation

OVERVIEW

The steering system comprises a ZF manufactured rack and pinion Servotronic 2 steering gear, a power steering pump, a fluid reservoir, a fluid cooler (if fitted) and fluid hoses. The steering gear is an end take-off rack and pinion power assisted unit with the addition of road speed proportional ZF Servotronic 2 assistance.

The steering rack is connected to the front wheel knuckles by adjustable tie-rods. The tie-rods allow for adjustment to centralize the steering wheel and also adjust the toe setting of the front wheel geometry.

The steering gear has a variable ratio rack. This provides conventional response when the steering is in the centre, straight ahead position, but provides more direct and faster steering as the turning angle increases. The variable ratio provides precise and rapid steering response at high speeds and provides optimized steering of the vehicle when manoeuvring into parking spaces, turning in tight areas and when cornering in extreme conditions.

Fluid is supplied to the steering gear by a fixed displacement vane pump on petrol models and a variable displacement pump on diesel models. The pump is driven by a belt from the crankshaft pulley. The pump is mounted on the [LH \(left-hand\)](#) side of the engine, above the [A/C \(air conditioning\)](#) compressor. A fluid reservoir is positioned at the front [LH](#) side of the engine compartment, forward of the front suspension housing.

On petrol engine vehicles, a fluid cooler is located in front of the engine cooling radiator. Diesel models do not have a fluid cooler.

Servotronic 2 adds electronic control and speed sensitive steering to the steering gear. The Servotronic 2 feature provides easy and comfortable steering operation when parking, improved 'road feel' at increased road speeds and adds an integrated, positive center feel feature which optimises steering wheel torque during high speed driving. The Servotronic 2 system is controlled by software which is incorporated into the instrument cluster. The software responds to road speed signals and controls the power assistance via a transducer valve located on the steering gear valve housing.

Power Steering - Power Steering - System Operation and Component Description

Description and Operation

System Operation

The following hydraulic circuits show power steering operation and fluid flow for the steering in a straight ahead, neutral position and when turning right. The circuit diagram for turning left is similar to that shown for turning right.

31	Power assist cylinder - right
32	Piston
33	Power assist cylinder - left

When the engine is started, the power steering pump draws fluid from the reservoir down the low pressure suction line. The fluid passes through the pump and is delivered at pressure, via a hose, to the steering rack valve unit.

The pressurized fluid flows through a connecting bore in the valve and, via the feed fluid radial groove and the transverse bores in the valve sleeve, passes to the feed fluid control groove of the valve rotor.

In the neutral (straight ahead) position, the fluid passes over the open feed fluid control edges to all valve sleeve axial grooves. The fluid then passes through return fluid control edges and the return fluid grooves of the valve rotor, back to the reservoir passes via the fluid cooler.

Simultaneously, the radial grooves of the valve and their associated pipes provide a connection the left and right power assist cylinders.

Power Steering in Right Turn Position

Item	Description
1	Return fluid control groove

26	Inner tie-rod
27	Pinion
28	Valve sleeve
29	Steering gear rack
30	Steering gear housing
31	Power assist cylinder - right
32	Piston
33	Power assist cylinder - left

When the steering wheel is turned to the right, the steering rack and piston moves to the left in the piston bore. The valve rotor is rotated to the right (clockwise) and pressurized fluid is directed over the further opened feed fluid control edges and to the associated axial grooves, the radial groove and via an external pipe to the left power assist cylinder chamber. The pressure applied to the piston from the left power assist cylinder chamber provides the hydraulic assistance.

An adaptable pressure build-up is achieved by the partially or fully closed feed fluid control edges restricting or preventing a connection between the fluid pressure inlet and the other axial grooves connected to the radial groove.

Simultaneously, the fluid pressure outlet to the pressurized axial grooves are restricted or partially restricted by the closing return fluid control edges. The fluid displaced by the piston from the right power assist cylinder chamber, flows through an external pipe to the radial grooves. From there the fluid passes to the associated axial grooves and on to the return fluid control grooves, via the further opened return fluid control edges.

The return flow of fluid to the reservoir passes via interconnecting bores which lead to the return fluid chamber. When the steering wheel is turned to the left the operating sequence is as above but the pressure is applied to the opposite side of the piston.

Servotronic Operation

The Servotronic software contains a number of steering maps which are selected via the car configuration file depending on the vehicle mode and tire fitment.

If a failure of the Servotronic valve or software occurs, the system will suspend Servotronic assistance and only normal power steering wheel be available. Fault codes relating to the fault are stored, but no warning lamps are illuminated and the driver may be aware of the steering being 'heavier' than usual.

When the vehicle is manoeuvred into and out of a parking space (or other similar manoeuvre), the Servotronic software uses road speed data from the ABS module to determine the vehicle speed, which in this case will be slow or stationary. The Servotronic software analyses the signals and outputs an appropriate control current to the Servotronic transducer valve. The Servotronic valve closes and prevents fluid flowing from the feed fluid radial groove to the reaction chamber. An orifice also ensures that there is return pressure in the reaction chamber. This condition eliminates any 'reaction' ensuring that the steering is very light to operate, reducing the effort required to turn the steering wheel.

As the vehicle is driven and the road speed increases, the Servotronic software analyses the road speed signals from the [ABS \(anti-lock brake system\)](#) module and reduces the amount of control current supplied to the Servotronic valve which increases the reaction pressure. This modifies the input torque applied through the steering wheel and provides the driver with an improved 'road feel' allowing precise steering and directional stability.

Component Description

Steering Gear

E97211

ItemDescription

1	Locknut (2 off)
2	RH (right-hand) tie-rod
3	Steering gear boot (2 off)
4	Steering gear
5	Bolt and washer (3 off)
6	Servotronic valve
7	Valve unit
8	Input shaft
9	LH (left-hand) tie-rod
10	Steering gear mounting bushes

The steering gear is located at the rear of the engine and attached to the front sub-frame. The gear is secured to the sub-frame with 3 bolts and washers which screw into threaded tubes in bushes which are integral with the sub-frame.

The steering gear comprises an aluminum, cast, valve housing which contains the hydraulic valve unit and Servotronic valve. The mechanical steering rack and the hydraulic actuator are located in a steel cylinder which is attached to the cast valve housing.

The steering gear uses a rack with an integrated piston which is guided on plain bearings within the cylinder and the valve housing. The pinion, which is attached to the valve unit, runs in bearings and meshes with the rack teeth. The rack is pressed against the pinion by a spring loaded yoke which ensures that the teeth mesh with the minimum of play. The pinion is connected to the valve unit via a torsion bar. The rotary motion of the steering wheel is converted into linear movement of the rack by the rack and pinion mechanism and is initiated by the valve unit. This movement is transferred into movement of the road wheels by adjustable tie-rods.

The rack teeth angles vary from 20 degrees in the centre position to 40 degrees at the end sections of the rack. It is this variation in teeth angles which provides the variable ratio.

The piston of the hydraulic actuator is located on the rack bar. Each side of the piston is connected to fluid pressure or fluid return via external metal pipes which are connected to the valve unit.

Each end of the rack bar has a threaded hole which provides for the fitment of the tie-rod. The external ends of the gear are sealed with boots which prevent the ingress of dirt and moisture. The tie-rod has a long threaded area which allows for the fitment of the tie-rod end. The thread allows for the adjustment of the steering toe. When the correct toe setting is achieved, a locknut is tightened against the tie-rod end preventing inadvertent movement.

The gear has a central hole machined along most of its length. The hole allows the air in the boots to be balanced when the steering is turned. The boots are serviceable items and are retained on the gear housing and the tie-rod with clips.

Valve Unit

E56740

ItemDescription

1	Pressure/return to/from steering gear
2	Return fluid chamber
3	Cut-off valve
4	Radial groove
5	Servotronic transducer valve
6	Fluid feed radial groove
7	Radial groove
8	Orifice
9	Balls
10	Compression spring
11	Torsion bar
12	Valve rotor
13	Reaction piston
14	Reaction chamber
15	Centering piece
16	Return to reservoir
17	Pressure supply from pump
18	Pinion
19	Steering gear rack bar
20	Valve sleeve

The valve unit is an integral part of the steering gear. The principle function of the valve unit is to provide power assistance (i.e. when parking) to optimize the effort required to turn the steering wheel.

The pinion housing of the valve is an integral part of the main steering gear casting. The pinion housing has four machined ports which provide connections for pressure feed from the power steering pump, return fluid to the reservoir and pressure feeds to each side of the cylinder piston.

The valve unit comprises an outer sleeve, an input shaft, a torsion bar and a pinion shaft. The valve unit is co-axial with the pinion shaft which is connected to the steering column via the input shaft. The valve unit components are located in the steering gear pinion housing which is sealed with a cap.

The outer sleeve is located in the main bore of the pinion housing. Three annular grooves are machined on its outer diameter. PTFE (polytetrafluoroethylene) rings are located between the grooves and seal against the bore of the pinion housing. Holes are drilled radially in each annular groove through the wall of the sleeve. The bore of the outer sleeve is machined to accept the input shaft. Six equally spaced slots are machined in the bore of the sleeve. The ends of the slots are closed and do not continue to the end of the outer sleeve. The radial holes in the outer sleeve are drilled into each slot.

The input shaft has two machined flats at its outer end which allow for the attachment of the steering column intermediate shaft yoke. The flats ensure that the intermediate shaft is fitted in the correct position. The inner end of the input shaft forms a dog-tooth which mates with a slot in the pinion shaft. The fit of the dog-tooth in the slot allows a small amount of relative rotation between the input shaft and the pinion shaft before the dog-tooth contacts the wall of the slot. This ensures that, if the power assistance fails, the steering can be operated manually without over stressing the torsion bar. The central portion of the input shaft has equally spaced longitudinal slots machined in its circumference. The slots are arranged alternately around the input shaft.

The torsion bar is fitted inside the input shaft and is an interference fit in the pinion shaft. The torsion bar is connected to the input shaft by a drive pin. The torsion bar is machined to a smaller diameter in its central section. The smaller diameter allows the torsion bar to twist in response to torque applied from the steering wheel in relation to the grip of the tyres on the road surface.

The pinion shaft has machined teeth on its central diameter which mate with teeth on the steering gear rack. A slot, machined in the upper end of the pinion shaft mates with the dog-tooth on the input shaft. The pinion shaft locates in the pinion housing and rotates on ball and roller bearings.

Servotronic Valve

The Servotronic transducer valve is located in a port in the side of the steering gear valve housing. The valve is sealed in the housing with an O-ring seal and is secured with two long screws into threaded holes in the housing. The Servotronic valve is a transducer controlled valve which responds to control signals supplied from Servotronic software in the instrument cluster.

The Servotronic valve determines the hydraulic reaction at the steering gear rotary valve and controls the input torque required to turn the steering wheel. The Servotronic system allows the steering to be turned with the optimum effort when the vehicle is stationary or manoeuvred at slow speed. The hydraulic reaction changes proportional to the vehicle speed, with the required steering effort increasing as the vehicle moves faster. At high speeds, the Servotronic system provides the driver with a good feedback through the steering providing precise steering and improved stability.

The instrument cluster receives road speed signals from the [ABS](#) module and calculates the correct controlling signal for the Servotronic valve. The Servotronic software within the instrument cluster has a diagnostic capability which allows a Jaguar approved diagnostic system to check the tune of the steering and retrieve fault codes relating to the Servotronic valve. Two fault codes are stored relating to the valve for positive connection short to ground or battery and negative connection short to ground or battery.

The Servotronic software within the instrument cluster also contains a number of steering maps which are selected via the car configuration file depending on the vehicle model and tire fitment.

If a failure of the Servotronic valve or software occurs, the system will suspend Servotronic assistance and only a default level of assistance will be available. Fault codes relating to the fault are stored in the instrument cluster. No warning lamps are illuminated and the driver may be aware of the steering being 'heavier' than usual.

Power Steering Pump - V6 and V8 Petrol Models

- NOTE: V8 pump shown

E83974

The power steering pumps used on the different petrol engine variants are basically the same pump with different flow control valve mechanisms. The pump is a positive displacement, vane type pump which supplies a constant fluid flow to the steering gear valve unit. The pump is driven by a Poly Vee belt from the crankshaft pulley. A self-adjusting tensioner is fitted to maintain the correct tension on the belt.

The pump has an internal pressure relief valve and a flow control valve. The pressure relief valve limits the maximum pressure supplied to the steering gear to 110 bar (1595 lbf in²) \pm 4 bar (58 lbf in²). The flow control valve limits the maximum flow to 7.5 l/min (1.64 gal/min) \pm 0.75 l/min (0.16 gal/min) regardless of engine speed. The pump has a displacement of 10.5 cm³/rev (0.64 in³/rev).

A shaft runs longitudinally through the pump. One end of the shaft is fitted with a pressed-on drive pulley, the opposite end of the shaft is closed by a cover. The shaft runs in bearings located in the body and oil seals at each end of the shaft prevent leakage of hydraulic fluid. The pump contains ten vanes which rotate within a cam ring and are driven by the shaft. As the vanes rotate, the cam ring causes the space between the vanes to increase. This causes a depression between the vanes and fluid is drawn from the reservoir via the suction hose into the space between the vanes.

As the shaft rotates, the inlet port is closed to the vanes which have drawn in fluid, trapping the fluid between the vanes. The cam ring causes the space between the vanes to reduce and consequentially compresses and pressurises the hydraulic fluid trapped between them.

Further rotation of the shaft moves the vanes to the outlet port. As the vanes pass the port plate the pressurized fluid passes from the pump outlet port into the pressure hose to the steering gear.

The pressurized fluid is subject to control by the flow control and pressure relief valve. The flow control valve maintains a constant flow of fluid supplied to the steering gear irrespective of engine speed variations. The pressure relief valve limits the maximum pressure on the output side of the pump. A metering orifice is included in the discharge port of the pump. If the pressure in the orifice reaches a predetermined level, a spring loaded ball in the centre of the flow control valve is lifted from its seat and allows pressurized fluid to recirculate within the pump.

The pressure relief valve will operate if the discharge from the pump is restricted, i.e.; steering held on full lock. If the output from the pump is blocked, all output is recirculated through the pump. In this condition, as no fresh fluid is drawn into the pump from the reservoir, the fluid temperature inside the pump will increase rapidly. Consequentially, periods of operation of the steering gear on full lock should be kept to a minimum to prevent overheating of the pump and the fluid within it.

Power Steering Pump - 2.7L V6 Diesel Models

E62199

A variable displacement power steering pump is used on the diesel engine variants. The variable displacement, vane type pump supplies the required hydraulic pressure to the steering gear valve unit. The pump is located at the front of the engine and is driven by the **FEAD (front end accessory drive)** Poly Vee belt which is directly driven from the crankshaft. The output from the pump increases proportionally with the load applied to the steering valve unit.

E62615

ItemDescription

1	Power steering fluid inlet port
2	Flow control valve
3	Power steering fluid outlet port
4	Variable Orifice

5	Pump rotor
6	High pressure
7	Adapter ring
8	Cam Ring
9	Low pressure

The pump consists of a shaft containing a number of slots into which vanes are inserted and these vanes run within a cam ring in the pump body. The centerline of the shaft is not concentric with that of the bore of the body and this creates the expanding and contracting cavities that form the pumping action.

The vanes rotate within the cam ring and are driven by the shaft. As the vanes rotate, the cam ring causes the space between the vanes to increase. This causes a depression between the vanes and fluid is drawn from the reservoir via the suction hose into the space between the vanes. As the shaft rotates, the inlet port is closed to the vanes which have drawn in fluid, trapping the fluid between the vanes. The cam ring causes the space between the vanes to reduce and consequently compresses and pressurizes the hydraulic fluid trapped between them. Further rotation of the shaft moves the vanes to the outlet port. As the vanes pass the port plate the pressurized fluid passes from the pump outlet port into the pressure hose to the steering gear.

The cam ring in the pump body can move within the valve body. By moving the cam ring it is possible to vary the eccentricity of the shaft and the vanes in relation to the cam ring. As the eccentricity is decreased, the volume of hydraulic fluid trapped between the vanes decreases, maintaining the flow in response to pump speed. This reduces the load required to turn the pump and therefore improves engine output and economy. This allows the flow rate to be matched to the system demands and increased flow rate is only required when the steering wheel is turned.

The pump has an internal regulating valve which controls the eccentricity of the cam ring and therefore varies the flow rate according to demand. The regulating relief valve limits the maximum pressure supplied to the steering gear to 110 bar (1595 lbf in²) \pm 4 bar (58 lbf in²) and also limits the maximum flow to 8.5 l/min (1.86 gal/min) \pm 0.5 l/min (0.1 gal/min) regardless of engine speed.

Fluid Reservoir

E97212

ItemDescription

1	Bolt and washer (2 off)
2	Rubber mounting (2 off)
3	Cap
4	Reservoir body
5	Return connection
6	Suction hose connection
7	Max/Min level
8	Lanyard

The reservoir is located in the engine compartment, on the [LH](#) suspension housing. The reservoir is attached to a bracket via 2 rubber mounts, and the bracket is attached to the suspension housing.

The reservoir is a plastic moulding with an integral 80 micron, non-serviceable filter. Two moulded ports at the base of the reservoir provide for attachment of the fluid supply hose to the power steering pump and fluid return hose from the fluid cooler. The reservoir is fitted with a removable cap which is screwed 1/4 turn to lock into the reservoir body.

The reservoir has upper and minimum marks moulded on its outside of the body.

Fluid Cooler

A

B

E97213

ItemDescription

A	V8 naturally aspirated and 3.0 V6
B	V8 supercharged
1	Fluid cooler
2	Hose - return to fluid reservoir
3	Hose - Return from steering gear valve unit

The fluid cooler is located in the return circuit from the steering gear to the reservoir. The cooler is an aluminum fin and tube design. Cool air entering the front of the vehicle passes over the cooler and flows through the fins. The fins act as heat exchangers, conducting heat from the fluid as it passes through the tube.

Power Steering - Steering Gear

Removal and Installation

Removal

• CAUTIONS:

Make sure that only the manufacturers' recommended four wheel alignment equipment is used.

Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

• NOTE: Make sure the steering is in the straight ahead position.

1. WARNING: Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. Center the steering wheel.

- Lock in position and remove the ignition key.

3. Remove the front wheels and tires.

For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).

4. Remove the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

5. Make sure the alignment mark, on the steering gear pinion seal protection cover, is central to the steering gear pinion casting.

E42703

6. Release both track rods from tie rod ends, note the number of turns for installation.

E100656

7. Disconnect the power steering control valve actuator electrical connector.

E62469

8.  CAUTION: Air tools MUST NOT be used on steering column bolts.

Disconnect the lower steering column from the steering gear.

- Remove and discard the bolt.

E62470

9. Release the power steering line support bracket.

10. CAUTIONS:

 Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean and dry. Plug open connections to prevent contamination.

 Cap the power steering line to prevent losses of fluid and dirt ingress.

 If power steering fluid is spilt on the paintwork, the effected area must be immediately washed down with cold water. Failure to follow this instruction may result in damage to the vehicle.

- NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the power steering feed and return fluid lines from the steering gear.

- Remove the bolt.

E62471

- Position a container to collect spillage.
- Remove and discard both O-ring seals.

11. Remove the steering gear.

- Remove the 3 bolts.

VUJ0002963

12.  CAUTION: Do not allow the gaiter to twist.

- NOTE: Do not disassemble further if the component is removed for access only.

Remove the outer tie-rod end, note the number of turns for installation.

- Loosen the tie-rod end lock nut.
- Repeat the above procedure for the other side.

E62473

Installation

1. To install, reverse the removal procedure.
2. Install the tie rod end, note the number of turns until adjacent to the locknut.
 - Repeat the above procedure for the other side.

E100656

3. Tighten the bolts to 100 Nm.

E31036

4. NOTE: Make sure that all the component mating faces are clean.

Tighten to 24 Nm.

- Install the new O-ring seals.

5. Tighten to 35 Nm.

- Install a new retaining bolt.

6. Fill and bleed the power steering system.

For additional information, refer to: [Power Steering System Bleeding](#) (211-00 Steering System - General Information, General Procedures).

7. Using only four-wheel alignment equipment approved by Jaguar, check and adjust the wheel alignment.

6	Locknut

Steering Linkage - Steering Linkage - Overview

Description and Operation

OVERVIEW

The steering linkage comprises the tie rod which provides the connection between the steering gear and the front wheel knuckle. Each end of the steering gear has a threaded hole which provides for the fitment of the inner tie rods. The external ends of the inner tie rods are sealed with boots to prevent the ingress of dirt and moisture into the steering gear.

Steering Linkage - Steering Linkage - System Operation and Component Description

Description and Operation

System Operation

TIE-ROD

The threads on the tie rods allow the position of the outer tie rod to be adjusted in order to set the correct toe angle for each front wheel.

Component Description

TIE-ROD

Each tie rod comprises two parts; an inner and outer tie rod. The inner and outer tie rods are screwed into each other and locked with a locknut to prevent inadvertent movement.

The outer tie rod incorporates a non-serviceable tapered ball joint which locates in a tapered hole in the front wheel knuckle and is secured with a self-locking nut. The ball joint has an internal hexagonal drive which enables the joint to be held stationary when the self-locking nut is tightened.

Steering Linkage - Steering Linkage

Steering Linkage - Tie Rod End

Removal and Installation

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the front wheel and tire.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
3. Loosen the tie-rod end lock nut.

4.  **CAUTION:** Make sure that the ball joint ball does not rotate.

Remove and discard the tie rod end retaining nut.

5. Remove the tie-rod end, note the number of turns for installation.

Installation

1. Install the tie rod end, note the number of turns until adjacent to the locknut.

2.  **CAUTION:** Make sure that the ball joint ball does not rotate.

Connect the tie-rod end ball joint.

- Clean the component mating faces.
 - Install a new nut and tighten to 133 Nm.
3. Tighten the tie-rod locking nut.
- Clean the component mating faces.
 - Tighten the nut to 55 Nm.
4. Install the front wheel.
For additional information, refer to: [Wheel and Tire](#) (204-04 Wheels and Tires, Removal and Installation).
5. Using only four-wheel alignment equipment approved by Jaguar, check and adjust the wheel alignment.
For additional information, refer to: [Four-Wheel Alignment](#) (204-00 Suspension System - General Information, General Procedures).

Steering Column - Steering Column - Overview

Description and Operation

OVERVIEW

The steering column comprises the upper column assembly, the lower column assembly and the steering wheel. The 3 components are positively connected together to pass driver rotary input from the steering wheel to a linear output of the steering rack.

The upper column assembly contains electrical adjustment for steering wheel reach and rake, the electric steering lock mechanism and the steering angle sensor. Steering adjustment memory positions are stored in the driver's seat module.

The electric steering column is a standard fitment on all models. The upper column assembly contains electrical adjustment for steering wheel reach and rake, the electric column lock mechanism and the steering angle sensor. Steering adjustment memory positions are stored in the driver's seat module. The column also features a 'tilt away' function which moves the steering column away from the driver allowing easier exit and entry to the vehicle.

Column adjustment is provided by a single motor for both reach and rake adjustment. Operation of the column adjustment is controlled by a four way joystick type switch located in the column lower shroud. Column adjustment is an integral part of the driver position memory system.

9	Column adjustment motor
10	Instrument cluster
11	Steering column adjust switch

System Operation

STEERING COLUMN ADJUSTMENT

Power for the column adjustment motor is supplied via a megafuse in the [BJB](#) to the [CJB](#). A fused supply from the [CJB](#) is passed to the instrument cluster which controls the power application to the motor.

The column adjust switch is hardwired to the instrument cluster. Up/down and in/out selections on the switch are each passed through a resistor of differing values to the instrument cluster. The cluster monitors the output value from the switch and operates the motor in the required direction and simultaneously energizes the required solenoid for rake or reach adjustment. When the applicable solenoid is energized, a clutch is engaged and locates on a lead screw. The motor rotates the lead screw and the rotational drive of the screw is transferred into linear movement of the applicable clutch to move either the rake or reach adjustment. For reach adjustment, the lead screw drives the outer housing in or out as required. For rake adjustment the lead screw drives a rake lever which moves the column up or down as required.

The position of the column is monitored by potentiometers which are connected to the instrument cluster. The cluster monitors the output signal from the potentiometers to precisely control the positioning of the column in each plane.

The instrument cluster controls the memory positioning of the column via a medium speed [CAN](#) bus connection to the driver's seat module. The driver's seat module receives information regarding the particular remote handset used to enter the vehicle and outputs positional information relative to that stored for the handset. This information is passed to the instrument cluster via the medium speed [CAN](#) bus which moves the column to the memorized positions.

The column logic in the instrument cluster also incorporates an entry/exit mode. When the vehicle is unlocked or the ignition is switched off, the instrument cluster lifts the column upwards to its maximum rake position to allow the driver more room below the steering wheel and improve access/egress of the vehicle. When the ignition is next switched on the column will adjust to its previous position.

The electric steering column lock is controlled by the [CJB](#) and is an integral function of the passive start system. Refer to: [Anti-Theft - Passive](#) (419-01B Anti-Theft - Passive, Description and Operation).

ItemDescription

1	Tube and clamping yoke pivot bearing
2	Tube yoke
3	Tolerance ring
4	Locking ring
5	Axial housing
6	Rake housing
7	Tube
8	Splined shaft
9	Crash adaptor
10	Steering angle sensor ring
11	Steering wheel mounting splines
12	Upper bearing
13	Column adjustment motor
14	Lower bearing
15	Outer clamping yoke
16	Ball (12 off)
17	Distance keeper
18	Crash tube

The column comprises a cast magnesium mounting bracket which provides the attachment to the cross-beam. Attached to the mounting bracket is a rake lever which is attached to the mounting bracket at the lower end with two pivot bearings. The bearings allow the rake lever to rotate upwards or downward to adjust the column rake.

The rake lever also provides for the attachment of the rake housing which can slide within the lever to provide the reach adjustment. Within the rake housing is the axial housing which is supported on each side with 6 ball bearings which allow the rake housing to move forward or backwards. The bearings on each side are arranged in groups of 3 bearings and are separated by a distance keeper which allows the housing to be supported on bearings along its length. Within the axial housing is a tube which is supported at the upper end of the column on the upper bearing. The tube has a central splined hole which provides for the fitment of the splined shaft. The splined shaft can slide within the tube on the splines when the column reach is adjusted or the column collapses in a crash condition. The splined shaft also passes rotary motion from the steering wheel through the length of the column to the outer clamping yoke which is supported on the lower bearing.

The electric steering column lock is attached to the top of the rake lever. A lock bolt within the steering column lock engages in one of 8 slots in the locking sleeve located at the lower end of the column preventing rotation of the steering wheel. The locking sleeve is retained by a tolerance ring which in turn is located on the outer diameter of the tube yoke. The tolerance ring allows a specified amount of torque to be applied to the splined shaft before it slips, preventing damage to the column lock due to excessive force being applied to the steering wheel when the lock is engaged. The tolerance ring is designed to slip on the splined shaft when the applied torque exceeds the fitted slip load of 200 Nm minimum. Repeated rotation of the lock collar will reduce its slipping torque to 100 Nm minimum. The lock is controlled by the [CJB](#) and is an integral function of the passive start system.

A steering angle sensor is located at the upper end of the steering column and is attached to the crash adaptor. The sensor measures steering rotation via a toothed wheel located on the splined tube at the upper end of the column. The sensor receives a power supply from the [CJB](#) and supplies 2 signals (A and B) relating to the steering rotation to the [ABS \(anti-lock brake system\)](#) module. The module transmits this data on the high speed [CAN](#) bus for use by other vehicle systems.

Refer to: [Anti-Lock Control - Stability Assist](#) (206-09 Anti-Lock Control - Stability Assist, Description and Operation).

The steering column is adjustable electrically, for reach and rake. The adjustment mechanism comprises an electric adjustment motor, a lead screw, a rake solenoid, a reach solenoid, a reach clutch and a rake clutch. The column adjustment is controlled manually using a joystick switch located on the [LH \(left-hand\)](#) side of the column lower cowl. The joystick can be moved forward and backward to adjust the column reach in and out and moved up and down to adjust the rake. The switch selection energizes the adjustment motor in the applicable direction and also engages the applicable solenoid and clutch.

When the joystick switch is rotated to the 'auto' position, the steering column will adjust to the uppermost rake position when the ignition is switched off. It will re-adjust to the position corresponding to the memory position for the remote handset when the ignition is switched on.

The memory function of the electric column is linked to and controlled by the driver's seat module. The module provides for the storage of three separate memory positions which are stored against 3 individual remote handsets. Refer to: [Seats](#) (501-10 Seating, Description and Operation).

The steering wheel locates on a splined shaft in the upper column assembly and is secured with a bolt. The steering wheel houses the driver's airbag and switches for the audio system, gear change and speed control. A clockspring is used to connect the steering wheel electrical components to the vehicle harness.

Two plastic shrouds are fitted to the upper column assembly. The lower shroud is fitted with an energy absorbing foam pad to minimize leg injury in the event of an accident.

LOWER SHAFT ASSEMBLY

E97706

ItemDescription

1	Yoke
2	Upper collapse shaft
3	Flexible coupling
4	Shaft plate
5	Rivet (4 off)
6	Upper tube
7	Plastic sleeve
8	Boot
9	Bearing (4 off)
10	Teeth tube
11	Lower shaft
12	Yoke clamp bolt (2 off)
13	Bearing (4 off)
14	Lower yoke
15	Spider
16	Upper yoke

The lower shaft assembly comprises 2 splined shafts connected by a universal joint in the center.

The upper collapse shaft has a flexible couple at its upper end. The flexible coupling controls axial and torsional movements and also assists with noise and vibration damping. The flexible coupling is fitted with a shaft plate which has a boss with machined flats on it. The flats provide positive location on the upper column outer clamping yoke. A cut-out in the boss allows for the fitment of a clamping bolt to secure the upper column outer clamping yoke. The cut-out ensures that the lower shaft assembly can only be fitted in one orientation.

The upper collapse shaft is connected to the stopper plate of the flexible coupling with splines. The stopper plate is connected to the shaft plate via the flexible coupling and is secured with rivets. The upper collapse shaft has a series of splines which engage with the upper tube. The splines allow the upper collapse shaft to slide into the upper tube in the event of an accident.

The upper tube is positively connected to the upper half of the yoke of the universal joint. A plastic tube is located around the upper tube and provides for the attachment of a boot which seals the lower shaft assembly where it passes through the vehicle bulkhead.

The yoke is attached to the teeth tube which in turn is located over the lower shaft on splines. The teeth tube is fitted with a tolerance ring which provides resistance to movement of the splines on the lower shaft. The splines of the lower shaft allow it to slide into the teeth tube with the tolerance ring controlling the collapse.

The lower shaft is fitted with a yoke which provides the attachment to the torsion bar of the steering valve unit.

Steering Column - Steering Wheel

Removal and Installation

Special Tool(s)	
	Clockspring locking tool
	211-326

E43628

Removal

1. Make the SRS system safe.
For additional information, refer to: [Standard Workshop Practices](#) (100-00 General Information, Description and Operation).
2. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
3. Remove the driver air bag module.
For additional information, refer to: [Driver Air Bag Module](#) (501-20B Supplemental Restraint System, Removal and Installation).
4. **NOTE:** Note the fitted position.

Remove the steering wheel.

- Disconnect the electrical connector.
- Loosen, but do not fully remove the bolt.
- Release the steering wheel from the spline.
- Remove the bolt.
- Release the electrical harness.

5. CAUTIONS:

 Failing to install the clockspring special tool, may result in damage to vehicle.

 Do not dismantle the clockspring, it has no serviceable parts and must be replaced as a complete assembly.

 Do not allow the clockspring to unwind.

Install the special tool to the clockspring.

6. NOTE: Do not disassemble further if the component is removed for access only.

Remove the upshift and downshift paddle switches.

- Remove the Torx bolt.
- Release the assembly.
- Disconnect the electrical connector.
- Repeat the procedure and remove the opposite hand.

7. NOTE: The steering wheel is shown removed for clarity.

Release the steering wheel switch assembly.

- Remove the Torx bolt.
- Repeat the procedure and remove the opposite hand.

8. Remove the air bag housing.

- Remove the 4 Torx bolts.
- Release the electrical harness.

9. Remove the air bag ground cable.

- Remove the Torx screw.

Installation

1. Install the air bag ground cable.

- Install the Torx screw.

E64763

2. Install the air bag housing.

- Secure the electrical harness.
- Tighten to 6 Nm.

E64761

3. Secure the steering wheel switch assembly.

- Connect and secure the electrical connectors.
- Tighten to 3 Nm.
- Repeat the above procedure on the opposite hand.

E64762

4. Install the upshift and downshift paddle switches.

- Connect and secure the electrical connector.
- Tighten to 3 Nm.
- Repeat the above procedure on the opposite hand.

E64760

5.  CAUTION: Make sure that the arrow on the cassette is centered and pointing vertically prior to the steering wheel installation. On removal of the special tool keep the clockspring cables taught to prevent the cassette moving from the set position. Do not allow the clockspring to unwind. Failure to follow this instruction may result in damage to the component.

Remove the special tool.

6.  CAUTION: Check the alignment arrow is still in the vertical position with the wheels straight ahead to make sure that the directional indicator cancellation is central.

Install the steering wheel.

- Check the clockspring is aligned.
- Position the electrical harness.
- Connect the electrical connector.
- Tighten to 40 Nm.

7. Install the driver air bag module.

For additional information, refer to: [Driver Air Bag Module](#) (501-20B Supplemental Restraint System, Removal and Installation).

8. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Steering Column Switches - Steering Column Switches - Component

Location

Description and Operation

STEERING COLUMN SWITCHES COMPONENT LOCATION

E93688

ItemDescription

1	Audio and telephone switches
2	Steering column adjustment switch
3	LH (left-hand) (-) gear change paddle switch
4	Steering column multifunction switches and clockspring
5	RH (right-hand) (+) gear change paddle switch
6	Speed control switches (Adaptive Speed Control switch pack shown, non adaptive speed control switch pack similar)

Steering Column Switches - Steering Column Switches - Overview

Description and Operation

OVERVIEW

The steering column multifunction switch is situated on the steering column and consists of the wiper switch, the turn signal indicator/lighting switch and the trip computer switch.

The **RH (right-hand)** multifunction switch controls the following windshield wiper functions:

- Flick wipe
- Intermittent wipe
- Slow speed wipe
- High speed wipe
- Wash/Wipe
- Headlamp powerwash
- Rain sensing / variable wipe selection.

The **LH (left-hand)** multifunction switch controls the following functions:

- Turn signal indicators
- Side lamps
- Headlamps
- Auto lamps
- High/low beam
- Headlamp flash
- Headlamp timer
- Trip computer.

The steering column adjustment switch is located in the steering column lower shroud on the **LH** side. The switch is a 4 position 'joystick' which controls reach and rake adjustment.

The trip button allows the driver to cycle through an option menu and also reset trip cycle mileage calculations. The trip computer information is displayed in the instrument cluster message centre.

Steering wheel mounted switches on the **LH** side of the driver's airbag, control the audio and telephone functions. Switches on the **RH** side of the driver's airbag, control the speed control functions.

The steering wheel has an internal heating element. This is controlled by the driver via the Touch Screen Display (TSD).

System Operation

LEFT HAND MULTIFUNCTION SWITCH

Turn Signal Indicators

The instrument cluster outputs a reference voltage to the turn signal indicator switch. When the switch is in the central off position, the voltage flows through 3 resistors which are connected in series and back to the instrument cluster which monitors the signal and determines the turn signal indicators are off. This information is broadcast on the medium speed [CAN](#) bus to the [CJB](#).

When the switch is operated in the [LH](#) turn signal indicator position, the reference voltage from the instrument cluster is routed via 1 of the resistors. The returned signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#). The [CJB](#) activates the applicable turn signal indicators until it receives an off message from the instrument cluster.

When the switch is operated in the [RH](#) turn signal indicator position, the reference voltage from the instrument cluster is routed via 2 of the resistors. The returned signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#). The [CJB](#) activates the applicable turn signal indicators until it receives an off message from the instrument cluster.

Lighting Control Switch

The instrument cluster outputs 2 reference voltages to the rotary lighting control switch; one feed being supplied to the light selection function of the switch and the second feed being supplied to the autolamp exit delay function. The switch position is determined by instrument cluster by the change in returned signal voltage which is routed through up to 4 resistors in series depending on the selection made.

When the lighting control switch is in the off position, the reference voltage flows through 1 of the resistors. The returned signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that no lighting selection is made. The reference voltage to the autolamp exit delay switch is routed through 4 resistors which is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that autolamp or exit delay has not been selected.

When the lighting control switch is in the sidelamp position, the reference voltage flows through 2 of the resistors. The returned signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) to activate the sidelamps. The reference voltage to the autolamp exit delay switch is routed through 4 resistors which is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that autolamp or exit delay has not been selected.

When the lighting control switch is in the headlamp position, the reference voltage flows through 3 of the resistors. The returned signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) to activate the headlamps. The reference voltage to the autolamp exit delay switch is routed through 4 resistors which is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that autolamp or exit delay has not been selected.

When the lighting control switch is in the autolamp position, the reference voltage flows through 4 of the resistors. The returned signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) to activate the autolamp function. The reference voltage to the autolamp exit delay switch is routed through 4 resistors which is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that autolamp has been selected.

Autolamp Exit Delay

When the lighting control switch is in any of the autolamp exit delay position, the lighting control switch reference voltage flows through 4 of the resistors. The returned signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that autolamps has been selected.

Depending on the selected position, the reference voltage to the autolamp exit delay switch is routed through 3, 2 or 1 resistors which is detected by the instrument cluster. The cluster outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that autolamp exit delay period has been selected at 30, 60 or 120 seconds respectively.

Trip Function Button

The instrument cluster outputs a reference voltage to the trip function button. When the function button is pressed a ground path is completed and a signal voltage is returned to the instrument cluster via a resistor. The returned reference voltage is detected by the instrument cluster and performs the requested trip function.

RIGHT HAND MULTIFUNCTION SWITCH

The instrument cluster outputs 4 separate reference voltages to the following switch functions:

- Wash/wipe switch
- Intermittent wipe switch
- Master wiper switch
- Flick wipe switch.

Wash/Wipe Switch

The reference voltage is supplied to one of two resistors connected in parallel. When the switch is not being operated the current flows through one resistor and the returned signal voltage is monitored by the instrument cluster. When the wash/wipe switch is operated, a connection is made and the current flows through the second resistor. The change in signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) to activate the wash/wipe function.

Intermittent Delay/Auto Wipe Switch

The reference voltage is supplied to the switch and can pass through up to 7 resistors, connected in series, for intermittent delay selections and the auto wipe function.

When the rotary switch is in the auto position the reference voltage flows through 1 resistor. The returned signal voltage is detected by the instrument cluster which determines auto wipe is selected. The instrument cluster outputs a message on the medium speed [CAN](#) bus to the [CJB](#) to activate the auto wipe function.

With the rotary switch in one of the intermittent positions, the reference voltage is routed through up to 7 of the resistors depending on the delay period selected. The returned signal voltage is detected by the instrument cluster which determines selected delay period. The instrument cluster outputs a message on the medium speed [CAN](#) bus to the [CJB](#) to activate the selected intermittent wipe function.

- **NOTE:** The delay period for the intermittent selections can vary according to vehicle speed.

Master Wiper Switch

The reference voltage supplied from the instrument cluster to the master wiper switch. The voltage can pass through up to 4 resistors connected in series.

When the switch is in the off position, the reference voltage passes through 4 resistors and the returned voltage is monitored by the instrument cluster. The instrument cluster outputs a message on the medium speed [CAN](#) bus to the [CJB](#) that no wiper selections have been requested.

With the switch in the intermittent, slow wipe or fast wipe position, the reference voltage passes through 3, 2 or 1 resistors respectively. The returned signal voltage is detected by the instrument cluster which determines selected delay period. The instrument cluster outputs a message on the medium speed [CAN](#) bus to the [CJB](#) to activate the selected wipe function.

Flick Wipe Switch

The reference voltage is supplied to one of two resistors connected in parallel. When the switch is not being operated the current flows through one resistor and the returned signal voltage is monitored by the instrument cluster. When the flick wipe switch is operated, a connection is made and the current flows through the second resistor. The change in signal voltage is detected by the instrument cluster which outputs a message on the medium speed [CAN](#) bus to the [CJB](#) to activate the flick wipe function.

STEERING COLUMN ADJUSTMENT SWITCH

The instrument cluster supplies 2 reference voltages to the column adjustment switch.

The first reference voltage is supplied to the joystick switch. When the switch is moved to one of its 4 positions, the switch contact is completed and the reference voltage is passed through one of 4 different resistors with different values. The returned signal voltage is measured by the instrument cluster which determines the selected column adjust request. The instrument cluster outputs a supply to the steering column adjustment motor and energizes the applicable clutch solenoid to move the column to the desired position.

The second reference voltage is supplied to the auto/manual selection of the switch. When the switch is in the auto position, the reference voltage passes directly through the switch contacts and is measured by the instrument cluster. The instrument cluster outputs a message on the medium speed [CAN](#) bus to the driver seat module which responds with the recorded memory position setting. The instrument cluster then activates the column adjustment motor and clutch solenoids to move the column to the memorized position. When the switch is in the manual position the reference circuit is broken. The instrument cluster detects the broken circuit and allows manual operation of the column adjustment switch to move the column.

HEATED STEERING WHEEL

The heated steering wheel receives a battery power supply via the [CJB](#). The heated steering wheel is controlled by the driver using a selection on the TSD. When the driver selects the heated steering wheel to be active, the request is passed from the TSD on the MOST ring to the information and entertainment module. The information and entertainment module converts the message into a medium speed [CAN](#) bus message which is passed to the [CJB](#). The [CJB](#) processes the request and allows the battery power supply to be passed via the slip ring assembly in the steering wheel to the heated steering wheel control module. The steering wheel module supplies power to the steering wheel heater element and also monitors the temperature via a [NTC \(negative temperature coefficient\)](#) temperature sensor incorporated into the heater element. The control module varies the power supply to the element to maintain the steering wheel rim at the optimum temperature.

Component Description

STEERING COLUMN MULTIFUNCTION SWITCHES

The steering column multifunction switches are situated on the steering column and consists of the wiper switch, the turn signal indicator/lighting switch and the trip computer switch.

The steering column adjustment switch is located in the steering column lower shroud on the [LH](#) side. The switch is a 4 position 'joystick' which controls reach and rake adjustment.

Steering wheel mounted switches on the [LH](#) side of the driver's airbag, control the audio and telephone functions. Switches on the [RH](#) side of the driver's airbag, control the speed control functions. For additional information, refer to:

- [Audio System](#) (415-01 Information and Entertainment System, Description and Operation),
- [Speed Control](#) (310-03A, Description and Operation),
- [Speed Control](#) (310-03B, Description and Operation),
- [Speed Control](#) (310-03 Speed Control - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

Two transmission paddle switches are located at the rear of the steering wheel. Refer to: [External Controls - Vehicles With: ZF 6HP26](#) (307-05 Automatic Transmission/Transaxle External Controls, Description and Operation).

LH Multifunction Switch

E97751

ItemDescription

1	High beam
2	Lighting control rotary switch
3	RH turn signal indicator
4	Headlamp flash
5	LH turn signal indicator
6	Trip computer function button

The [LH](#) multifunction switch controls the following windshield wiper functions:

- Turn signal indicators
- Side lamps
- Headlamps
- Auto lamps
- High/low beam
- Headlamp flash
- Headlamp timer
- Trip computer.

The switch is located in a slot in the clockspring and secured with 2 plastic clips.

RH Multifunction Switch

E97752

ItemDescription

1	Auto/intermittent rotary switch
2	Fast wipe
3	Slow wipe
4	Intermittent wipe
5	Off position
6	Wash/wipe
7	Flick wipe

The RH multifunction switch controls the following windshield wiper functions:

- Flick wipe
- Intermittent wipe
- Slow speed wipe
- High speed wipe
- Wash/Wipe
- Headlamp powerwash
- Rain sensing / variable wipe selection.

The switch is located in a slot in the clockspring and secured with 2 plastic clips.

STEERING COLUMN ADJUSTMENT SWITCH

The column adjustment switch is located in the steering column lower shroud and held in place with a spring clip. The switch allows the adjustment of the steering column for both reach and rake angle. The switch has an auto position which allows the desired position of the column to be set by the driver using the driver's seat memory buttons. The column position is automatically reset once the applicable remote handset has been detected by the vehicle security systems.

STEERING WHEEL HEATER

On certain models the rim of the steering wheel contains a heater element. Operation of the heater is selected using the Touch Screen Display (TSD).

The heater temperature is controlled by a heated steering wheel control module located within the steering wheel. Power for the heater element is supplied to the steering wheel via 2 contacts on the clockspring and a slip ring mounted on the steering wheel.

Steering Column Switches - Steering Column Switches

Diagnosis and Testing

Principle of Operation

For a detailed description of the steering column lock and switches, refer to the relevant Description and Operation section in the workshop manual. REFER to: (211-05 Steering Column Switches)

[Steering Column Switches](#) (Description and Operation),
[Steering Column Switches](#) (Description and Operation),
[Steering Column Switches](#) (Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. 1. Verify the customer concern.
2. 2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Switches ● Steering column lock 	<ul style="list-style-type: none"> ● Fuse(s) ● Electrical connector(s) ● Wiring Harness

3. 3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. 4. If the cause is not visually evident, check for DTCs and refer to the DTC Index.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action
B100D51	Column lock authorisation	<ul style="list-style-type: none"> ● Not programmed 	Check ignition, power and ground supplies to steering column lock and instrument cluster. Re-synchronise ID by re-configuring the steering column lock as a new module
B100D62	Column lock authorisation - signal compare failure	<ul style="list-style-type: none"> ● CAN fault ● Steering column lock fault ● Instrument cluster fault ● Incorrect module installed (Steering column lock/Instrument cluster) ● Target ID synchronisation error following re-programming ● Noise/EMC related error 	Check CAN network between steering column lock and instrument cluster. Check power and ground supplies to steering column lock and instrument cluster. Confirm the correct modules are installed. Re-synchronize ID by re-configuring the steering column lock as new. Check CAN network for interference/EMC related issues
B100D64	Column lock authorisation - signal plausibility failure	<ul style="list-style-type: none"> ● CAN fault ● Steering column lock fault ● Instrument cluster fault 	Check CAN network to steering column lock. Check power and ground supplies to steering column lock and instrument cluster
B100D87	Column lock authorisation - missing message	<ul style="list-style-type: none"> ● CAN fault ● Steering column lock fault ● Instrument cluster fault ● Low voltage at steering column lock < 8V 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Check CAN network between steering column lock and instrument cluster. Check power and ground supplies to steering column lock and instrument cluster

Refer to component tests in this section
Oil consumption	● Carry out oil leak check followed by an oil consumption test. Refer to the component tests in this section ● If oil consumption is excessive: ● Check the integrity of the engine breather system ● Carry out general engine checks: - Compression test. Refer to component tests in this section. - Valve clearances - Spark plug condition and color
Noise	● Refer to the Special Service Messages on the Electronic Product Quality Report (EPQR) system for sound files. If the symptom does NOT compare to any of the sound files, contact Dealer Technical Support (DTS)

Component Tests

Engine Oil Leaks

- NOTE: Before installing new gaskets or oil seals, make sure that the fault is clearly established.

If the oil leak cannot be identified clearly by a visual inspection, carry out an Ultraviolet test:

Fluorescent Oil Additive Method

1. Clean the engine with a suitable cleaning fluid (brake cleaner).
2. Drain the engine oil and refill with recommended oil, premixed with Diesel Engine Oil Dye or equivalent. Use a minimum 14.8 ml (0.5 ounce) to a maximum 29.6 ml (1 ounce) of fluorescent additive to all engines. If oil is not premixed, fluorescent additive must first be added to the crankcase.
3. Run engine for 15 minutes. Stop the engine and inspect all seal and gasket areas for leaks using a 12 Volt Master UV Diagnostic Inspection Kit or equivalent. A clear bright yellow or orange area will identify leak. For extremely small leaks, several hours may be required for the leak to appear.
4. As necessary, pressurize the main oil gallery system to locate leaks due to incorrectly sealed, loose or cocked plugs. If the flywheel bolts leak oil, look for sealer on the threads.
5. Repair all leaks as necessary.

Compression Test

General Remarks

• NOTE: Removing fuses and disconnecting electrical components may cause the Engine Control Module (ECM) to log Diagnostic Trouble Codes (DTCs). After the measurements have been carried out, DTCs should be cleared from memory by connecting to the Manufacturer Approved Diagnostic System.

- NOTE: Only check the compression pressure with the valves set to the prescribed clearance (if this can be adjusted).

The compression pressure should be checked with the engine at normal operating temperature.

Check the Compression Pressure

WARNING: Move gear selector lever to 'P' position. Failure to follow this instruction may result in personal injury.

1. Remove the fuel pump relay.
2. Start the engine - the engine will start, run for a few seconds then stall.
3. Remove the spark plugs.
4. Install the compression tester.
5. Install an auxiliary starter switch in the starting circuit. With the ignition switch OFF, using the auxiliary starter switch, crank the engine a minimum of five compression strokes and record the highest reading. Note the approximate number of compression strokes required to obtain the highest reading.
6. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.
7. Install the removed components in reverse order, observing the specified tightening torques.
8. Clear all DTCs from the ECM.

Interpretation of the Results

• **NOTE:** Due to the possibility of loose carbon that has become trapped between the valve face and seat effecting the pressure readings, when carrying out a compression test and cylinders are found to have low pressures, install the spark plugs, road test the vehicle and re-test the suspect cylinders. If the correct pressures are restored, no further action is required.

The indicated compression pressures are considered within specification if the lowest reading cylinder is within 75% of the highest reading.

If the cylinder pressures are found to be low, carry out a leakdown test to determine the location of the fault (if any leakback can be heard through the engine breather system suspect the piston rings, if any leakback can be heard through the inlet system suspect the inlet valve or seat, if any leakback can be heard through the exhaust manifold suspect the exhaust valve or seat. If the measurements for two cylinders next to each other are both too low then it is very likely that the cylinder head gasket between them is burnt through. This can also be recognized by traces of engine oil in the coolant and/or coolant in the engine oil).

Oil Consumption Test

The amount of oil an engine uses will vary with the way the vehicle is driven in addition to normal engine-to-engine variation. This is especially true during the first 16,100 km (10,000 miles) when a new engine is being broken in or until certain internal components become conditioned. Vehicles used in heavy-duty operation may use more oil. The following are examples of heavy-duty operation:

- Trailer towing applications
- Severe loading applications
- Sustained high speed operation

Engines need oil to lubricate the following internal components:

- Cylinder block cylinder walls
- Pistons and piston rings
- Intake and exhaust valve stems
- Intake and exhaust valve guides
- All internal engine components

When the pistons move downward, a thin film of oil is left on the cylinder walls. As the vehicle is operated, some oil is also drawn into the combustion chambers past the intake and exhaust valve stem seals and burned.

The following are examples of conditions that can affect oil consumption rates:

- Engine size
- Operator driving habits
- Ambient temperatures
- Quality and viscosity of oil
- Engine is being run in an overfilled condition (check the oil level at least five minutes after a hot shutdown with the vehicle parked on a level surface. The oil level should not be above the top of the cross-hatched area and the letter "F" in FULL).

Operation under varying conditions can frequently be misleading. A vehicle that has been run for several thousand miles on short trips or in below-freezing ambient temperatures may have consumed a "normal" amount of oil. However, when checking the engine oil level, it may measure up to the full mark on the oil level indicator due to dilution (condensation and fuel) in the engine crankcase. The vehicle then might be driven at high speeds on the highway where the condensation and fuel boil off. The next time the engine oil is checked it may appear that a liter of oil was used in about 160 km (100 miles). Oil consumption rate is about one liter per 2,400 km (1,500 miles).

Make sure the selected engine oil meets Jaguar specification and the recommended API performance category "SG" and SAE viscosity grade as shown in the vehicle Owner's Guide. It is also important that the engine oil is changed at the intervals specified for the typical operating conditions.

The following diagnostic procedure is used to determine the source of excessive oil consumption.

• **NOTE:** Oil use is normally greater during the first 16,100 km (10,000 miles) of service. As mileage increases, oil use decreases. High speed driving, towing, high ambient temperature and other factors may result in greater oil use.

1. Define excessive consumption, such as the number of miles driven per liter of oil used. Also determine customers driving habits, such as sustained high speed operation, towing, extended idle and other considerations.
2. Verify that the engine has no external oil leaks as described under Engine Oil Leaks in this section.
3. Carry out an oil consumption test:
 - Run the engine to normal operating temperature. Switch engine OFF and allow oil to drain back for at least five minutes .
 - With vehicle parked on level surface, check the engine oil level.
 - If required, add engine oil to set level exactly to the FULL mark.
 - Record the vehicle mileage.
 - Instruct the customer to return for a level check after driving the vehicle as usual for 1,610 km (1000 miles).
 - Check the oil level under the same conditions and at the same location as the initial check.

• **NOTE:** If the oil consumption rate is unacceptable go to Step 4.

4. Check the Positive Crankcase Ventilation (PCV) system. Make sure the system is not plugged.
5. Check for plugged oil drain-back holes in the cylinder head and cylinder block.
6. If the condition still exists after carrying out the above tests go to step 9.
7. Carry out a cylinder compression test. Refer to the Compression Test procedure in this section. This can help

determine the source of oil consumption such as valves, piston rings or other areas.

8. **8.** Check valve guides for excessive guide clearance. Install new valve stem seals after verifying valve guide clearance.
9. **9.** Worn or damaged internal engine components can cause excessive oil consumption. Small deposits of oil on the tips of the spark plugs can be a clue to internal oil consumption.

Intake Manifold Vacuum Test

Bring the engine to normal operating temperature. Connect a vacuum gauge or equivalent to the intake manifold. Run the engine at the specified idle speed.

The vacuum gauge should read between 51-74 kPa (15-22 in-Hg) depending upon the engine condition and the altitude at which the test is performed. Subtract 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 feet) of elevation above sea level.

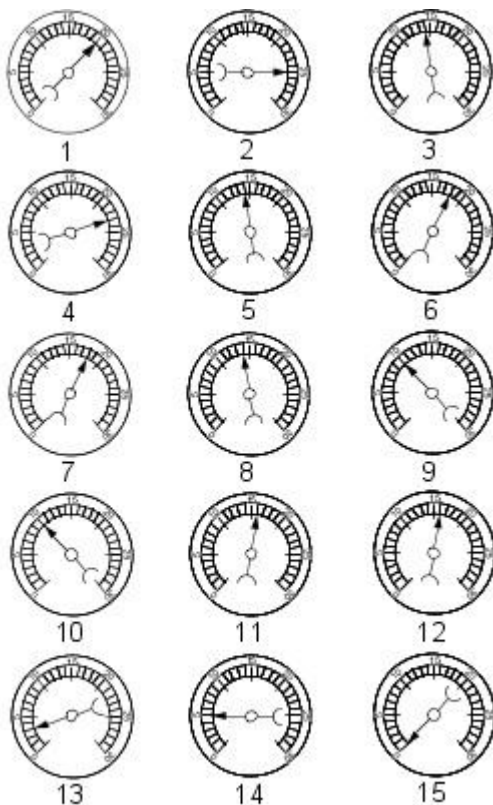

The reading should be steady. As necessary, adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust damper until needle moves easily without excessive flutter.

Interpreting Vacuum Gauge Readings

A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas. Always conduct other appropriate tests before arriving at a final diagnostic decision. Vacuum gauge readings, although helpful, must be interpreted carefully.

Most vacuum gauges have a normal band indicated on the gauge face.

The following are potential gauge readings. Some are normal; others should be investigated further.

VUJ0001694

1. **1. NORMAL READING:** Needle between 51-74 kPa (15-22 in-Hg) and holding steady.
2. **2. NORMAL READING DURING RAPID ACCELERATION:** When the engine is rapidly accelerated, the needle will drop to a low (not to zero) reading. When the throttle is suddenly released, the needle will snap back up to a higher than normal figure.
3. **3. NORMAL FOR HIGH-LIFT CAMSHAFT WITH LARGE OVERLAP:** The needle will register as low as 51 kPa (15 in-Hg) but will be relatively steady. Some oscillation is normal.
4. **4. WORN RINGS OR DILUTED OIL:** When the engine is accelerated, the needle drops to 0 kPa (0 in-Hg). Upon deceleration, the needle runs slightly above 74 kPa (22 in-Hg).
5. **5. STICKING VALVES:** When the needle remains steady at a normal vacuum but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.
6. **6. BURNED OR BENT VALVES:** A regular, evenly-spaced, downscale flicking of the needle indicates one or more burned or damaged valves. Insufficient hydraulic valve tappet or hydraulic lash adjuster clearance will also cause this reaction.
7. **7. POOR VALVE SEATING:** A small but regular downscale flicking can mean one or more valves are not seating

correctly.

8. **8. WORN VALVE GUIDES:** When the needle oscillates over about a 13 kPa (4 in-Hg) range at idle speed, the valve guides could be worn. As engine speed increases, the needle will become steady if guides are responsible.
9. **9. WEAK VALVE SPRINGS:** When the needle oscillation becomes more violent as engine RPM is increased, weak valve springs are indicated. The reading at idle could be relatively steady.
10. **10. LATE VALVE TIMING:** A steady but low reading could be caused by late valve timing.
11. **11. IGNITION TIMING RETARDED:** Retarded ignition timing will produce a steady but somewhat low reading.
12. **12. INSUFFICIENT SPARK PLUG GAP:** When spark plugs are gapped too close, a regular, small pulsation of the needle can occur.
13. **13. INTAKE LEAK:** A low, steady reading can be caused by an intake manifold or throttle body gasket leak.
14. **14. BLOWN HEAD GASKET:** A regular drop of fair magnitude can be caused by a blown head gasket or warped cylinder head to cylinder block surface.
15. **15. RESTRICTED EXHAUST SYSTEM:** When the engine is first started and is idled, the reading may be normal, but as the engine RPM is increased, the back pressure caused by a clogged muffler, kinked tail pipe or other concerns will cause the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idling.

When vacuum leaks are indicated, search out and correct the cause. Excess air leaking into the system will upset the fuel mixture and cause concerns such as rough idle, missing on acceleration or burned valves. If the leak exists in an accessory such as the power brake booster, the unit will not function correctly. Always repair vacuum leaks.

Engine System - General Information - EngineTDV6 2.7L Diesel

Diagnosis and Testing

Principle of Operation

For a detailed description of the 2.7L Diesel engine, refer to the relevant Description and Operation section in the workshop manual. REFER to: (303-14A Electronic Engine Controls - TDV6 2.7L Diesel)

Engine takes too long to reach operating temperature	<ul style="list-style-type: none"> ● Thermostat stuck open 	For cooling system checks, REFER to: Engine Cooling (303-03A Engine Cooling - TDV6 2.7L Diesel, Diagnosis and Testing).
External oil leaks	<ul style="list-style-type: none"> ● Gaskets ● Seals ● Oil pipes ● Oil filter ● Oil cooler ● Damaged/cracked casings ● Crankcase ventilation system ● Piston ring blow-by 	Clean and confirm the area of the leak. Check the visual condition of oil carrying components. Check the crankcase ventilation system, REFER to: Engine Emission Control (303-08A Engine Emission Control - TDV6 2.7L Diesel, Diagnosis and Testing). Carry out a compression test, GO to Pinpoint Test A .
Internal oil leaks (leaks into coolant or combustion chamber) Note: This may be indicated by the production of blue smoke from the exhaust	<ul style="list-style-type: none"> ● Gaskets ● Seals ● Damaged/cracked casings ● Worn valve guides ● Worn cylinder bores/pistons ● Broken piston rings 	Check for traces of oil in the coolant. Check for evidence of oil in the combustion chambers (deposits on the glow plugs, etc). Confirm oil consumption and vehicle usage with the owner/driver. Carry out an oil consumption test, GO to Pinpoint Test B .

Symptom Chart, NVH

• NOTE: As the checks suggested here are open to interpretation, they should be used as a guide only. Descriptions of noises, etc, are in general terms, so depend on a degree of experience on the part of the technician.

Symptom	Possible Cause	Action
---------	----------------	--------

Symptom	Possible Cause	Action
Rattle/ticking from top of engine	<ul style="list-style-type: none"> ● Valve gear noise ● Camshaft bearing noise ● Camshaft chain noise ● Tensioner noise ● Vacuum pump noise ● High pressure fuel pump noise 	Check the engine oil pressure, GO to Pinpoint Test C... . Check the function of the hydraulic tappets and the camshaft condition. Check the camshaft bearings, chains and tensioners. Check the vacuum pump, and high pressure fuel pump
Growl from top of engine	<ul style="list-style-type: none"> ● High pressure fuel pump belt noise ● High pressure fuel pump belt tensioner noise 	Check the high pressure fuel pump belt and tensioner
Squeaking/Creaking/Squeal from front of engine	<ul style="list-style-type: none"> ● Front End Accessory Drive (FEAD) belt ● FEAD belt tensioner ● Driven components on FEAD belt 	Check the FEAD belt and driven components, REFER to: Accessory Drive (303-05A Accessory Drive - TDV6 2.7L Diesel, Diagnosis and Testing).
Whine/Slap/Growl from front of engine	<ul style="list-style-type: none"> ● Front End Accessory Drive (FEAD) belt ● FEAD belt tensioner ● Driven components on FEAD belt ● Timing belt noise ● Timing belt tensioner noise 	Check the FEAD belt and driven components. Check the timing belt and tensioners
Knock from lower half of engine (often worse with a cold engine)	<ul style="list-style-type: none"> ● Piston slap ● Piston pin noise ● Connecting rod bearing noise 	Check the engine oil pressure, GO to Pinpoint Test C... . Check piston, cylinder bore, piston pin and connecting rod bearing for excess wear
Knock/Rumble from lower half of engine (often worse on overrun)	<ul style="list-style-type: none"> ● Main bearing noise 	Check the engine oil pressure, GO to Pinpoint Test C... . Check connecting rod bearing for excess wear
Misfire/Rough running	<ul style="list-style-type: none"> ● Engine management system ● Fuel charging and controls ● Exhaust gas recirculation (EGR) system ● Burnt/sticking valves ● Worn valve guides ● Worn cylinder bores/pistons ● Broken piston rings ● Damaged/cracked casings 	For engine management system tests, REFER to: Electronic Engine Controls - 2.7L Diesel (303-14A, Diagnosis and Testing). For fuel charging and controls systems tests, REFER to: Fuel Charging and Controls (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Diagnosis and Testing), Turbocharger (303-04B Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Diagnosis and Testing). For EGR system tests, REFER to: Engine Emission Control (303-08A Engine Emission Control - TDV6 2.7L Diesel, Diagnosis and Testing). Carry out a compression test, GO to Pinpoint Test A... Check for excess wear in engine components

Pinpoint Tests

• NOTE: Where reference is made to 'suitable equipment', this refers to standard workshop equipment. Refer to the operating instructions for your own equipment when performing any tests.

PINPOINT TEST A : CHECK THE CYLINDER COMPRESSIONS

 **WARNING:** Only compression testers able to read the higher compression pressures found in diesel engines should be used. Failure to follow this instruction may result in personal injury.

• NOTE: Where possible, compression testing should be carried out on an engine at operating temperature.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: CARRY OUT A DRY CYLINDER COMPRESSION TEST	
1	Make sure the parking brake is applied and that the selector lever is in park.
2	Set the ignition status to OFF .
3	Remove the starter relay.
4	Disconnect the starter motor solenoid connector.
5	Connect a suitable remote starter device to the starter motor solenoid.
6	Remove the glow plugs, REFER to: Glow Plugs - 2.7L V6 - TdV6 (303-07C Glow Plug System, Removal and Installation).
7	Install adaptor 303-1131 in place of the glow plug in the first cylinder to be tested.
8	Connect a suitable compression tester to the adaptor. See warning above.
9	Using the remote starter device, crank the engine a minimum of five revolutions.
10	Record the compression figure and the number of revolutions taken to reach it.
11	Repeat steps 7 - 10 above for the remaining cylinders, cranking the engine for a similar number of revolutions each time.
12	Compare the compression figures across all the cylinders.
	Are the compression figures within 10% of each other?
Yes	Unless the compression figures are universally very low (experience will indicate this), check for other causes for the customer complaint.
No	GO to A2.
A2: CARRY OUT A WET CYLINDER COMPRESSION TEST	

CAUTION: If engine oil is introduced into the cylinders, run the engine at 2,000 rpm for a minimum of ten minutes after completing testing to prevent damage to the catalytic converters. Failure to follow this instruction may result in damage to the vehicle.

• **NOTE:** There is a combustion chamber in the top of each piston. Make sure that the oil is not allowed to run into this chamber.

1	Using a suitable oil can with a flexible spout, introduce a small amount of clean engine oil into the cylinder just before testing, such that the oil is able to run between the piston and the cylinder bore.
2	Repeat steps 7 - 10 from the test above, introducing oil into each cylinder just before testing.
3	Compare the compression figures across all the cylinders.
Is the compression figure higher than the dry test?	
Yes	
A higher figure following the introduction of oil may indicate a worn or damaged cylinder bore, piston and/or piston rings. Disassembly would be required to confirm this.	
No	
If the compression figure is unaffected by the introduction of oil, but the figure is still less than 90% of the other cylinders, this may indicate a burnt and/or sticking valve, leaking head gasket, etc. Disassembly would be required to confirm this.	
Clear any DTCs which may have been induced by the test.	

PINPOINT TEST B : OIL CONSUMPTION TEST

• **NOTE:** Oil consumption will vary, depending on a number of factors. New engines will normally use more oil than 'run-in' engines, although a guideline would be to expect 16,000 Km (10,000 miles) per liter.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: CHECK FOR EXCESSIVE OIL CONSUMPTION	
1	Start the engine and allow it to run until it reaches normal operating temperature.
2	Make sure the vehicle is parked on a level surface and set ignition status to OFF .
3	Allow to settle for at least five minutes.
4	Check the oil level.
5	Correct the level, if necessary, and record the reading and mileage in the vehicle history.
6	Make sure that the owner/driver is aware that a test is being carried out, and that they should not top-up their oil level for the duration of the test, but should check the level every 160-240 Km (100-150 miles).
7	When the oil level reaches the ADD mark, the customer should bring the vehicle in to be checked.
8	Top-up the oil to the level at the beginning of the test and record the amount of oil needed to do so, and the mileage covered in the course of the test.
9	From this, the consumption can be calculated, and a decision made as to whether or not the consumption is considered excessive.
Is the consumption excessive for the mileage and/or use?	
Yes	
Disassembly will be required to check the components indicated in the symptom chart.	
No	
No further action is required.	

PINPOINT TEST C : CHECK THE ENGINE OIL PRESSURE

• **NOTE:** Check and, if necessary, top-up the engine oil level before beginning this test.

• **NOTE:** Where reference is made to 'suitable equipment', this refers to standard workshop equipment. Refer to the operating instructions for your own equipment when performing any tests.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: CHECK FOR LOW ENGINE OIL PRESSURE	
1	Remove the oil pressure sensor, REFER to: Engine Oil Pressure (EOP) Sensor (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Removal and Installation).
2	Connect a suitable oil pressure gauge in place of the oil pressure sensor.
3	Start the engine and check for leaks at the gauge connection.
4	Allow the engine to idle and monitor the oil pressure.
5	Raise the engine speed to 2,500 rpm and monitor the oil pressure.
Is the oil pressure less than 0.50 bar (7.25 psi) between idle and 2,500 rpm?	
Yes	
GO to C2.	
No	
GO to C3.	
C2: CHECK FOR LOW ENGINE OIL PRESSURE AT ENGINE SPEEDS GREATER THAN 2,500 RPM	
1	Raise the engine speed to above 2,500 rpm and monitor the oil pressure.
Is the oil pressure less than 1.0 bar (14.5 psi) at engine speeds greater than 2,500 rpm?	
Yes	
Pressure this low may indicate a problem with: oil pump, filtering, clearances within the engine. Check if there are any other indications of engine faults (noise, etc), refer to the symptom chart above.	
No	
GO to C3.	
C3: CHECK FOR HIGH ENGINE OIL PRESSURE	
1	Monitor the engine oil pressure at varying engine speeds.
Does the oil pressure reach 4.0 bar (58 psi)?	
Yes	
Pressure this high may indicate a blockage in the lubrication system. If this is not resolved, high oil pressure will lead to engine oil leaks and other failures.	
No	
If the oil pressure stays in the band between 0.50 bar (7.25 psi) and 1.0 bar (14.5 psi) this would be considered normal.	

Engine System - General Information - Bearing Inspection

General Procedures

1. Inspect bearings for the following defects.

1. Cratering - fatigue failure
2. Spot polishing - incorrect seating.
3. Imbedded dirt engine oil.
4. Scratching - dirty engine oil.
5. Base exposed - poor lubrication.
6. Both edges worn - journal damaged.
7. One edge worn - journal tapered or bearing not seated.

VUJ0002219

Engine System - General Information - Camshaft Bearing Journal Clearance

General Procedures

VUJ0001696

1. NOTE: Make sure that the following stages are followed exactly. The tappets or followers must be removed to carry out this measurement.

- **NOTE:** Make sure that the camshaft is to specification.
- **NOTE:** The bearing caps and journals should be free from engine oil and dirt.

Position on a length of plastigage on the bearing cap.

- Insert the camshaft, without lubrication, into the cylinder head.
- Position a plastigage strip, which should be equal to the width of the bearing cap, on the bearing journal.

2. Install the camshaft bearing caps.

- Follow the relevant tightening sequence.

3. NOTE: Do not strike the bearing caps.

Remove the camshaft bearing caps.

- Follow the relevant loosening sequence.

4. Using the special tool, read off the measurement.

- Compare the width of plastigage with the plastigage scale.
- The value that is read off is the bearing clearance.
- If the values are not to specification install a new camshaft.

VUJ0001697

Engine System - General Information - Camshaft Bearing Journal Diameter

General Procedures

1. Determine the diameter of the camshaft journals.

- Using a micrometer measure the diameter at 90 degree intervals to determine if the journals are out-of-round.
- Measure at two different points on the journal to determine if there is any tapering.
- If the measurements are out of the specified range, install a new camshaft.

VUJ0001695

Engine System - General Information - Camshaft End Play

General Procedures

VUJ0001698

1. NOTE: Make sure that the camshaft is to specification.

Using the special tool, measure the end play.

- Slide the camshaft in both directions. Read and note the maximum and minimum values on the dial indicator gauge.
 1. End play = maximum value minus minimum value.
- If the measurement is out of specification, install new components.

Engine System - General Information - Camshaft Lobe Lift

General Procedures

1. Measure the diameter (1) and diameter (2) with a vernier caliper. The difference in measurements is the lobe lift.

VUJ0001699

Engine System - General Information - Camshaft Surface Inspection

General Procedures

1. Inspect camshaft lobes for pitting or damage in the active area. Minor pitting is acceptable outside the active area.

VUJ0001700

Engine System - General Information - Connecting Rod Cleaning

General Procedures

VUJ0002224

1.  CAUTION: Do not use a caustic cleaning solution or damage to connecting rods may occur.

Mark and separate the parts and clean with solvent. Clean the oil passages.

Engine System - General Information - Connecting Rod Large End Bore

General Procedures

1. Measure the bearing bore in two directions. The difference is the connecting rod bore out-of-round. Verify the out-of-round is within specification.

VUJ0002223

2. Measure the bearing bore diameter in two directions. Verify the bearing bore is within specification.

VUJ0002222

Engine System - General Information - Crankshaft End Play

General Procedures

1. Using the Dial Indicator Gauge with Brackets, measure the end play.

- Measure the end play by lifting the crankshaft using a lever.
- If the value is out of the specification, install new thrust half rings to take up the end float and repeat the measurement.

VUJ0002235

Engine System - General Information - Crankshaft Main Bearing Journal ClearanceV6

3.0L Petrol

General Procedures

1. The main bearing machine codes are displayed on the crankshaft (1) and the cylinder block (2)

E53234

2. **NOTE:** Main bearing number 1 relates to the front of the engine.

Read the identification numbers from the crankshaft (1).

- The first two numbers represent the code for main bearing number 1.
- The second pair of numbers represents the code for main bearing number 2.
- The third pair of numbers represents the code for main bearing number 3.
- The last pair of numbers represents the code for main bearing number 4.

E53234

3. NOTE: Main bearing number 1 relates to the front of the engine.

Read the identification numbers on the cylinder block (2).

- The first two numbers represent the code for main bearing number 1.
- The second pair of numbers represents the code for main bearing number 2.
- The third pair of numbers represents the code for main bearing number 3.
- The last pair of numbers represents the code for main bearing number 4.

E53234

4. Using the select fit chart, for each main bearing match the crankshaft code (1) and the block code (2) with it's corresponding column or row. By reading across the crankshaft code row (1) and down the block code column (2) select the correct grade bearing for each main.

- 1 Crankshaft code.
- 2 Block code.

Engine System - General Information - Crankshaft Main Bearing Journal Clearance

4.2L NA V8 - AJV8/4.2L SC V8 - AJV8

General Procedures

CAUTION: THESE PROCEDURES SHOULD NOT BE CARRIED OUT DURING THE MANUFACTURERS WARRANTY PERIOD.

1. NOTE: Example - *PJEAL* - Crankshaft Main Journal Diameter.

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crank journal at the front of the engine is grade P, and at the rear is grade L.

- The selection of main bearing shells is described in the following chart.

E33992

2. NOTE: Example - *ABAA* - Crankshaft (Big End Bearing) Crankpin Diameter

- NOTE: For vehicles built up to 2002 MY.
- NOTE: If the crankshaft main bearing carrier retaining bolts have been marked with a center punch dot, they must be discarded and new bolts installed.

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crankpin at the front of the engine is grade A and at the rear is also grade A.

- Grade A = 56,000 to 55,994 mm (Bearing Shell Color Code - Blue).
- Grade B = 55,994 to 55,988 mm (Bearing Shell Color Code - Green).
- Grade C = 55,988 to 55,982 mm (Bearing Shell Color Code - Yellow).

3. NOTE: Example - *ABAA* - Crankshaft (Big End Bearing) Crankpin Diameter

- NOTE: For vehicles built from 2002 MY.

• **NOTE: If the crankshaft main bearing carrier retaining bolts have been marked with a center punch dot, they must be discarded and new bolts installed.**

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crankpin at the front of the engine is grade A and at the rear is also grade A.

- Grade A = 53,000 to 52,994 mm (Bearing Shell Color Code - Blue).
- Grade B = 52,994 to 52,988 mm (Bearing Shell Color Code - Green).
- Grade C = 52,988 to 52,982 mm (Bearing Shell Color Code - Yellow).

4. NOTE: Example - *21222122* - Cylinder Bore and Piston

The cylinder bore grades read from LEFT to RIGHT as follows:

- Bank 2 - Cylinder 1, Bank 2 - Cylinder 2, Bank 2 - Cylinder 3, Bank 2 - Cylinder 4, Bank 1 - Cylinder 4,
- Bank 1 - Cylinder 3, Bank 1 - Cylinder 2, Bank 1 - Cylinder 1.
- **(Note, in earlier publications Bank 1 was described as A-Bank and Bank 2 as B-Bank)**
- Grade 1 Bore = 85,990 to 86,000 mm.
- Grade 2 Bore = 86,000 to 86,010 mm.
- Grade 3 Bore = 86,010 to 86,020 mm.

5. NOTE: Example - *WPPNN* - Crankshaft Main Bearing Bore in Cylinder Block

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crank journal bore at the front of the engine is grade W, and at the rear is grade N.

- The selection of main bearing shells is described in the following **JOURNAL DIAMETER AND MAIN BEARING BORE CHART**.

6. JOURNAL DIAMETER AND MAIN BEARING BORE CHART

MAIN BEARING BORE

E94075

7. NOTE: THIS PROCEDURE SHOULD ONLY BE CARRIED OUT WHEN REPLACING MAIN BEARING SHELLS.

• NOTE: Refer to the **JOURNAL DIAMETER AND MAIN BEARING BORE CHART** in step 6 for tolerance and bearing information.

The number in each diagonal band represents a PAIR of color coded main bearing shells which must be used with a specific journal, depending on the combination of journal diameter and crankshaft bore diameter. The color codes for each band are as follows:

1. Blue / Green and Blue / Green
2. Blue / Green and Blue
3. Blue and Blue
4. Blue and Green
5. Green and Green
6. Green and Yellow
7. Yellow and Yellow

- Consider crankshaft journal 5 (from the example grade markings on the cylinder block) - the cylinder block bore is Grade N and the crankshaft journal diameter is Grade L.

From the chart, it will be seen that the point of intersection is in Band 4 which equates to one Blue shell and one Green shell.

- When the appropriate pair of color codes have been selected for a journal, either color may be installed to the cylinder block or to the bedplate, but, the shell which is to be installed to the cylinder block must have an oil groove and the shell which is to be installed to the bedplate must be plain.

8. NOTE: THIS PROCEDURE SHOULD ONLY BE CARRIED OUT WHEN A REPLACEMENT CRANKSHAFT OR CYLINDER BLOCK HAS BEEN FITTED.

- NOTE: Refer to the **JOURNAL DIAMETER AND MAIN BEARING BORE CHART** in step 6 for tolerance and bearing information.

The thickness grade of all main bearing shells are to be selected to give a total running clearance of not less than 0.022 mm or greater than 0.040 mm.

- Each bearing bore in the block/bedplate assembly should be measured at two mutually perpendicular diameters 45° to the vertical in the middle of the bearing.
- The minimum diameter of the two is to be used.
- Each crankshaft main bearing journal should be measured dynamically at a point in line with the middle of each bearing.
- When the appropriate pair of color codes have been selected for a journal, either color may be installed to the cylinder block or to the bedplate, but, the shell which is to be installed to the cylinder block must have an oil groove and the shell which is to be installed to the bedplate must be plain.

Engine System - General Information - Cylinder Bore Out-of-Round

General Procedures

1. NOTE: The main bearing caps or lower crankcase must be in place and tightened to the specified torque; however, the bearing shells should not be installed.

Measure the cylinder bore with an internal micrometer.

- Carry out the measurements in different directions and at different heights to determine if there is any out-of-roundness or tapering.
- If the measurement is out of the specified range, hone out the cylinder block or install a new block.

VUJ0002234

Engine System - General Information - Cylinder Head Distortion

General Procedures

VUJ0001701

1. Measure the cylinder block/cylinder head distortion.

- Using the special tool, measure the mating face distortion.
- If the value is not to specification rework the mating face.

Engine System - General Information - Exhaust Manifold Cleaning and Inspection

General Procedures

1. Inspect the cylinder head joining flanges of the exhaust manifold for evidence of exhaust gas leaks.
2. Inspect the exhaust manifold for cracks, damaged gasket surfaces, or other damage that would make it unfit for further use.

Engine System - General Information - Piston Inspection

General Procedures

VUJ0002233

1.  CAUTION: Do not use any aggressive cleaning fluid or a wire brush to clean the piston.

Carry out a visual inspection.

- Clean the piston skirt, pin bush, ring grooves and crown and check for wear or cracks.
- If there are signs of wear on the piston skirt, check whether the connecting rod is twisted or bent.

Engine System - General Information - Piston Pin Diameter

General Procedures

VUJ0002225

1. NOTE: The piston and piston pin are a matched pair. Do not mix up the components.

Measure the piston pin diameter.

- Measure the diameter in two directions.
- If the values are not to specification, install a new piston and a new piston pin.

Engine System - General Information - Piston Pin to Bore Diameter

General Procedures

VUJ0002232

1. NOTE: The piston and piston pin form a matched pair. Do not mix up the components.

Measure the diameter of the piston pin bore.

- Measure the diameter in two directions.
- If the values are not to specification, install both a new piston and a new piston pin.

Engine System - General Information - Piston Ring End Gap

General Procedures

1.  CAUTION: Do not mix up the piston rings. Install the piston rings in the same position and location.

Using the Feeler Gauge, measure the piston ring gap.

- The values given in the specification refer to a gauge ring used during production.

Engine System - General Information - Piston Ring-to-Groove Clearance

General Procedures

1. NOTE: The piston ring must protrude from the piston groove. To determine the piston ring clearance, insert the Feeler Gauge right to the back of the groove, behind the wear ridge.

Using the Feeler Gauge, measure the piston ring clearance.

Engine System - General Information - Valve Spring Free Length

General Procedures

1. Using a vernier gauge, measure the free length of each valve spring. Verify the length is within specification.

VUJ0002221

Engine System - General Information - Valve Stem Diameter

General Procedures

1. Using a micrometer measure the diameter of the valve stems.

- If the measurements are not to specification, install a new valve.

VUJ0002220

Engine - TDV6 2.7L Diesel -**Lubricants, Fluids, Sealers and Adhesives**

Engine - TDV6 2.7L Diesel - Engine - Component Location

Description and Operation

External View

E93304

Engine - TDV6 2.7L Diesel - Engine - Overview

Description and Operation

Overview

The 2.7 liter diesel engine is a V6 configuration unit with 2 banks of 3 cylinders arranged at 60 degrees to each other. There are 4 valves per cylinder, which are operated by 2 overhead camshafts per cylinder bank.

The cylinder block is cast in compacted graphite iron, which uses less material to produce compared to a conventional cast iron block. This provides reduced weight and length with superior structural capabilities. A separate aluminum ladder frame, bolted to the underside of the cylinder block, provides a lightweight, compact and very stiff bottom end of the engine.

The cylinder heads are cast aluminum with a moulded plastic camshaft cover. The single-piece oil pan is formed from stamped steel. The cast iron exhaust manifolds are unique for each cylinder bank. A moulded plastic acoustic cover is fitted over the upper engine to absorb engine-generated noise.

A low, by diesel standards, compression ratio of 17.3:1 contributes to improved emissions quality, quieter combustion and compatibility with the engine's unique forced induction system.

Refer to: [Intake Air Distribution and Filtering](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Description and Operation).

The low compression ratio also means less heat build-up in the piston bowl and more efficient fuel burn, resulting in the production of lower levels of pollutants.

Engine - TDV6 2.7L Diesel - Engine - System Operation and Component Description

Description and Operation

System Operation

Operation of the engine is controlled by the [ECM \(engine control module\)](#).

Refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

Component Description

Engine Structure

E94880

ItemDescription

1	Cylinder heads
2	Cylinder block
3	Ladder frame
4	Oil pan

Cylinder Block Components

The cylinder block is of a single cast compacted graphite iron construction with a hollow beam structure. This type of construction provides outstanding strength and durability and uses less material than a conventional cast iron block, therefore, reducing engine weight and length.

As the benefits of compacted graphite iron derive from its strength, this enables lightweight and thin-wall designs to be created for high-compression diesel applications.

- **NOTE:** Arrow indicates front of engine.

Engine Data

E44217

ItemDescription

- 1 Engine data locations

Engine data is marked at 2 locations at the back of the cylinder block. Component diameters are represented by alphabetical and numerical codes; keys to the codes are in the removal and installation section of this manual.

Piston Cooling Jets

E44219

ItemDescription

- 1 Bolt
- 2 Piston cooling jet

Jets located in the cylinder block provide piston and piston pin lubrication and cooling. These jets spray oil on to the inside of the piston, the oil then flows through 2 internal wave shaped channels to help cool each piston crown.

Lubrication oil is distributed through the cylinder block, via the main oil gallery and channels bored in the block, to all critical moving parts. These channels divert oil to the main and connecting rod bearings via holes machined into the crankshaft.

A tapping at the front of the cylinder block, below the **RH (right-hand)** cylinder head, connects a pipe to the turbochargers by means of a banjo connection. Oil is supplied, under pressure via this tapping, from the oil pump to provide lubrication for the turbochargers bearings.

Cylinder cooling is achieved by coolant circulating through chambers in the cylinder block casting.

Two hollow metal dowels are used to locate the cylinder heads to the cylinder block, 1 on each side at the rear of the unit.

A port is included at the **RH** and **LH (left-hand)** side of the cylinder block, below each of the turbochargers, to connect the turbochargers oil return pipe to the oil pan.

Two coolant drain plugs are installed in the cylinder block, 1 is fitted in the rear **RH** side, and the other is fitted in the middle of the cylinder block on the **LH** side.

On vehicles destined for cold climates, a cylinder block heater replaces a core plug in the middle of the cylinder block on the **LH** side.

Piston and Connecting Rod Assembly

E52134

ItemDescription

1	Connecting rod bolts (2 off)
2	Connecting rod
3	Piston
4	Piston pin
5	Circlips
6	Connecting rod identification

The connecting rods are manufactured from sinter-forged steel and have fracture-split bearing caps. The bearing caps are produced by fracturing the opposing sides of the connecting rod at the bearing horizontal centre-line. As well as being easier to manufacture, when reassembled the fractured surfaces interlock to form a strong seamless joint. The cylinder position is etched on adjoining sides of the joint to identify matching connecting rods and bearing caps. The selective connecting rod bearings are aluminum/tin split plain bearings. The connecting rod bearing is 'sputter coated', which is a manufacturing process that layers the bearing material to produce a higher load capacity for improved durability.

• **NOTE:** The connecting rods are not selective.

Piston and Connecting Rod Orientation

E44221

ItemDescription

1	Piston and connecting rod assembly, cylinders 4-6
2	Piston and connecting rod assembly, cylinders 1-3
3	Bolts (12 off)
4	Connecting rod bearing cap (6 off)
5	Connecting rod lower bearing (6 off)

When installing a connecting rod, ensure the back of the connecting rod faces the center of the 'vee'.

The pistons are made from aluminum alloy and are fitted with 3 rings. The piston crown incorporates a pronounced bowl; this forms the combustion chamber, which promotes swirl and turbulence necessary for good combustion and improved emissions. In addition, the piston skirt has a molybdenum-coated surface, which counteracts scoring of the cylinder bore and piston.

The piston also incorporates a double wave gallery within the piston crown to enhance piston cooling. The pistons are supplied oil by means of spray jets located in the cylinder block oil gallery. These jets ensure optimum piston cooling to counteract the high temperatures generated by the combustion process.

Each piston is installed on a piston pin located in a aluminum/tin bushing in the connecting rod.

Piston Ring Orientation

E52133

ItemDescription

1	Ring gap oil control
2	Ring gap upper compression
3	Spiral joint oil control
4	Ring gap lower compression
5	Upper compression ring
6	Lower compression ring
7	Oil control ring

When installing pistons ensure the arrows on the piston crowns all point to the front of the engine and the pistons are located in the correct cylinder banks, i.e. cylinders 1, 2, 3 or cylinders 4, 5, 6.

All pistons are common single grade/single part number for all engines.

The piston top ring is a taper type and is fitted with the taper to the top of the piston. All rings marked 'top' are assembled with 'top' uppermost. All rings must be spaced evenly around the piston before installing. The circumference gap of the double bevelled oil control ring must be opposite the spiral control joint.

Crankshaft and Oil Pan Components

Crankshaft

E52135

ItemDescription

1	Oil pump drive
2	Main bearing journal
3	Connecting rod bearing journal
4	Rear drive flange
5	Rear oil seal location
6	Trigger wheel location

The crankshaft is forged steel and fillet rolled with induction hardened journals, which run in 4 bearings with clamped 2 layer bearing shells. The upper and lower shells of bearing number 4 are flanged, which limits the end float of the crankshaft. The main bearing caps are double bolted and cross bolted to increase the strength and rigidity of the engine block.

The main bearings are aluminum/tin split plain selective bearings. An oil groove in the top half of each bearing transfers oil into the crankshaft for lubrication of the connecting rod bearings. The upper and lower shells of bearing number 4 contain integral thrust washers, which limits the end float of the crankshaft.

Rear Main Oil Seal and Retainer

E44227

ItemDescription

- | | |
|---|------------------------|
| 1 | Housing |
| 2 | Seal |
| 3 | Crankshaft |
| 4 | Rear oil seal retainer |
| 5 | Bolt (10 off) |

The rear main oil seal and retainer assembly is a one-piece unit and is supplied with its own plastic fitting sleeve. The seal and retainer have 2 locating dowels, 10 fixing bolts and a rubber seal. In addition the retainer has a location for the crankshaft position sensor. Refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

A torsional vibration crankshaft damper pulley is bolted to the front of the crankshaft.

Trigger Wheel

E52137

ItemDescription

- | | |
|---|---------------|
| 1 | Special tool |
| 2 | Trigger wheel |

The crankshaft trigger wheel is located on the rear of the crankshaft. It is pressed onto the crank using a special tool, which also precisely aligns the trigger wheel for crankshaft position and timing. The trigger wheel consists of 60 magnets minus 2 for [ECM](#) crankshaft position reference and synchronisation. The magnets cannot be seen on the trigger wheel, which therefore can only be positioned using a special tool.

Refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

If the trigger is removed for any reason, then a new trigger wheel must be fitted.

Ladder Frame

E44229

ItemDescription

1 Ladder frame

The ladder frame is fitted to the lower cylinder block to stiffen the base structure of the engine thus helping to reduce Noise, vibration and harshness. The frame is made of high-pressure die cast aluminum and also incorporates an oil baffle plate to reduce oil foaming and splash.

The ladder frame is secured to the cylinder block with 2 dowels, 2 locator pins for the gasket and 18 retaining bolts; 3 different lengths of bolts are used:

- M6 x 20 (6 off).
- M8 x 75 (4 off).
- M6 x 105 (8 off).

Iron inserts, cast into the main bearing supports of the ladder frame, minimize main bearing clearance changes due to heat expansion.

A gasket seals the joint between the ladder frame and the cylinder block.

A port for the oil level gage tube is included in the casting on the [LH](#) side of the ladder frame.

An oil pick-up pipe with integral strainer locates in the front of the ladder frame to provide oil to the crankshaft driven oil pump.

Oil Pan

E52142

ItemDescription

1	Gasket
2	Draining bolt seal
3	Draining bolt
4	Sump pan
5	Retaining bolts

The pressed steel oil pan is bolted to the ladder frame with 14 M6 x 16 bolts and is sealed with a reusable gasket. The engine oil drain plug and the oil temperature sensor are located towards the front of the oil pan.

Refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

Camshaft Timing Components

E94884

ItemDescription

1	Rear engine accessory drive rear cover
2	Rear engine accessory drive tensioner
3	Bolt
4	Fuel pump pulley
5	Nut
6	Rear engine accessory drive camshaft pulley
7	Rear engine accessory drive belt
8	Bolt
9	Rear engine accessory drive front cover
10	RH chain tensioner
11	RH timing chain
12	RH intake camshaft
13	RH exhaust camshaft
14	LH intake camshaft
15	LH exhaust camshaft
16	LH chain tensioner
17	LH timing chain
18	Timing belt
19	Front cover bridge
20	Primary drive cover
21	Bolt

28	Bolt
29	Idler
30	Bolt
31	Bolt (3 off)
32	Bolt
33	RH camshaft timing pulley
34	Camshaft hub

Primary drive is provided by a single toothed belt from the crankshaft to the exhaust camshaft gears of each cylinder bank via 2 idler pulleys and a tensioner.

Timing belt adjustment is carried out by an eccentric type tensioner mounted on the [RH](#) front face of the cylinder block.

Secondary Drive

E44233

ItemDescription

1	Timing chain
2	Bolts
3	Intake camshaft
4	Exhaust camshaft
5	Tensioner firing pin

Secondary drive is provided by 2 short crossover chains, which transfer drive from the exhaust camshaft gears to the intake camshaft gears. The crossover drives are located at the rear of the [RH](#) cylinder bank and the front of the [LH](#) cylinder bank. This allows for a much shorter and simpler run for the main camshaft drive belt at the front of the engine.

Each crossover chain is tensioned via an automatic chain tensioner, which acts directly on the chains via a guide rail. The tensioners are located between the exhaust and intake camshafts at the front or rear of the cylinder head, depending on the cylinder bank.

The tensioner firing pin holds the automatic chain tensioner in a compressed state to aid installation.

Timing Cover

E94882

The plastic timing cover is bolted to the front of the cylinder block and cylinder heads with 16 bolts and sealed with a rubber seal.

Cylinder Heads

E44236

ItemDescription

- 1 Studs
- 2 Bolts
- 3 Blanking plug

The aluminum gravity die cast cylinder heads are unique to each cylinder bank. Eight deep-seated bolts help reduce distortion and secure each cylinder head to the cylinder block. The cylinder head bolts are located beneath the camshafts, 4 under the intake camshaft and 4 under the exhaust camshaft. Two hollow dowels align each cylinder head with the cylinder block.

• **NOTE:** The cylinder heads cannot be reworked.

The cylinder head gasket is a 3-layer, laminated steel type and is available in 5 different thickness. The choice of gasket thickness is dependent on the maximum piston protrusion. Gasket thickness is identified by serrations cut into the front end of the gasket.

The cylinder head has 4 ports machined at each cylinder location, 2 exhaust ports and 2 intake ports. One of the intake ports is helical and functions as a swirl port, the other is arranged laterally as a tangential port and functions as a charge port.

The camshafts are of a hollow steel tube construction, with pressed on sintered lobes. Each camshaft is retained by aluminum alloy caps, 5 for the exhaust camshafts and 4 for the intake camshafts. Location letters, A to I for the intake camshaft and R to Z for the exhaust camshaft, are marked on the outer faces of the caps for each cylinder head.

The LH cylinder bank exhaust camshaft is machined to accept a rear camshaft gear. The rear camshaft gear provides drive for the high-pressure fuel pump.

Refer to: [Fuel Charging and Controls](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Description and Operation).

The exhaust camshaft gear of the LH cylinder head also incorporates a trigger wheel, which is used in conjunction with the camshaft sensor to measure engine position.

Refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

The RH cylinder head exhaust camshaft is machined at the rear end to provide a drive connection for the vacuum pump.

The fuel injection nozzles are centrally mounted above each cylinder.

Refer to: [Fuel Charging and Controls](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Description and Operation).

The glow plugs are arranged centrally on the intake side of the cylinder heads, between the 2 intake ports of each cylinder.

Refer to: [Glow Plug System](#) (303-07C Glow Plug System, Description and Operation).

The engine lifting eyes are bolted to the cylinder head, 1 at the front and 2 at the rear, 1 per cylinder head.

Camshaft Covers

E44237

Item Description

- | | |
|---|--|
| 1 | Stud bolt M6 x 40 (6 off) |
| 2 | Bolt M6 x 40 (7 off) |
| 3 | Oil filler aperture |
| 4 | RH camshaft cover assembly |

The camshaft covers are manufactured from vinyl ester composite. The [RH](#) bank camshaft cover incorporates an outlet for the full load engine breather and the engine oil filler cap. The [LH](#) bank camshaft cover incorporates an outlet for the part load engine breather. Refer to: [Engine Emission Control](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Description and Operation).

Silicon rubber in-groove gaskets seal the joints between the camshaft covers and the cylinder heads. Together with spacers and seals on the camshaft cover fasteners, they also isolate the covers from direct contact with the cylinder heads, to reduce noise.

Camshaft Timing

Valve	Position
Intake valve opens	8.5° BTDC (before top dead center)
Intake valve closes	35.5° ABDC (after bottom dead center)
Exhaust valve opens	64° BBDC (before bottom dead center)
Exhaust valve closes	12° ATDC (after top dead center)

Intake and Exhaust Valves

E44239

ItemDescription

1	Valve spring collet (24 off, 12 per cylinder head)
2	Valve spring retainer (24 off, 12 per cylinder head)
3	Valve spring (24 off, 12 per cylinder head)
4	Valve stem seal (24 off, 12 per cylinder head)
5	Intake valve (12 off, 6 per cylinder head)
6	Exhaust valve (12 off, 6 per cylinder head)

Each cylinder head incorporates 2 overhead camshafts operating 4 valves per cylinder via steel roller rockers with hydraulic lash adjusters.

Roller Rockers with Hydraulic Lash Adjusters

E44238

ItemDescription

1	Roller rocker (24 off, 12 per cylinder head)
2	Hydraulic lash adjuster (24 off, 12 per cylinder head)

The lightweight valve gear provides good economy and noise levels. Valve head diameters are 31 mm (1.220 in) for the exhaust and 35 mm (1.378 in) for the intake. All valves have 5 mm (0.197 in) diameter stems supported in sintered metal seats and guide inserts. Collets, valve collars and spring seats locate single valve springs on both intake and exhaust valves. Valve stem seals are integrated into the spring seats.

Vacuum Pump

E44243

ItemDescription

1	Location dowel (2 off)
2	Bracket
3	Vacuum pump
4	Bolt
5	Bolt (2 off)
6	Nut
7	Bracket (transmission breather hose)
8	Stud

The vacuum pump is located at the rear of the [RH](#) side cylinder head and is driven from the exhaust camshaft.

• NOTE: [LH](#) exhaust manifold shown; [undefined \(undefined\)](#) exhaust manifold similar.

9 Turbocharger assembly

10 Bolt (2 off)

11 Turbocharger heat shield

12 Nut (6 off)

13 Exhaust manifold

14 Stud (6 off)

15 Gasket

The exhaust manifolds are cast from steel alloy and are unique for each cylinder bank. They are sealed to the cylinder head by means of a steel gasket. Sacrificial plastic sleeves are used to align the manifolds. These sleeves must be changed when refitting the manifolds. Spacers on the securing bolts allow the manifolds to expand and retract with changes of temperature while maintaining the clamping loads.

Each manifold has a connection for the [EGR](#) transfer pipe.

The engine is fitted with twin variable geometry turbochargers, which fix to the exhaust manifolds by a 3-hole flange with a steel gasket.

Lubrication System

E52138

Oil is drawn from the reservoir in the oil pan and pressurized by the oil pump. The output from the oil pump is then filtered and distributed through internal oil passageways.

All moving parts are lubricated by pressure or splash oil. Pressurized oil is also provided for operation of the hydraulic adjusters and the timing gear chain tensioners.

Oil/Fuel Cooler and Filter Assembly

E52140

ItemDescription

1	Filter housing
2	'O' ring seal
3	Paper element
4	Retaining bolt (8 off)
5	Cooler assembly
6	Coolant outlet connection

The engine is lubricated by a force-feed oil circulation system with a full flow oil filter. The oil cooler forms a unit with the oil filter and fuel cooler, which is mounted centrally in the middle of the cylinder block between the 2 banks of cylinders. The engine oil is cooled using the engine cooling system. This eliminates the need for an additional engine oil cooler remotely mounted.

The fuel cooler, which forms part of the oil filter body, is also cooled by engine coolant. In addition there is a further fuel cooler in the return line to the fuel tank.

Oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the quick return of the oil, reducing the volume of oil required and enabling an accurate check of the contents soon after the engine stops.

System replenishment is through the oil filler cap on the [RH](#) camshaft cover.

The moulded composite oil pick-up is immersed in the oil reservoir to provide a supply to the oil pump during all normal vehicle attitudes. A mesh screen in the inlet prevents debris from entering the oil system.

E44230

ItemDescription

1	Oil pump
2	Bolt (10 off)

The oil pump is a gear type pump and is bolted and dowelled to the front of the cylinder block. It is sealed by means of a rubber gasket, which is recessed into the oil pump housing. The pump inlet and outlet ports align with oil passages in the ladder frame.

The pumping element is an eccentric rotor, which is directly driven by flats on the crankshaft. An integral pressure relief valve regulates pump outlet pressure at 4.5 bar (65.25 psi).

The front crankshaft oil seal is housed in the oil pump casing and is fitted such that its front face is 1 mm (0.04 in) under flush with the machined front face of the oil pump.

• **NOTE:** The seal is not to be pushed all the way into the bore as this will block the seal drains.

The oil pressure switch, located in the 'vee' at the front of the [LH](#) cylinder head, connects a ground input to the instrument cluster when oil pressure is present. The switch operates at a pressure of 0.15 to 0.41 bar (2.2 to 5.9 psi).

The oil level gage locates midway along the [LH](#) side of the oil pan, supported in a tube installed in the ladder frame. There is a difference of approximately 1 liter (1 US quart) between the upper and lower oil levels.

Engine - TDV6 2.7L Diesel - Engine

Diagnosis and Testing

For additional information.

REFER to: [Engine - TDV6 2.7L Diesel](#) (303-00 Engine System - General Information, Diagnosis and Testing).

Engine - TDV6 2.7L Diesel - Engine Oil Draining and Filling

General Procedures

 **WARNING:** The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the air deflector.
For additional information, refer to: [Air Deflector \(501-02, Removal and Installation\)](#).

3.  **WARNING:** Observe due care when draining engine oil as the oil can be very hot.

• **NOTE:** Remove and discard the seal.

Drain the engine oil.

- Allow the fluid to drain into a container.
- Remove the drain plug and drain the engine oil.

E95114

4. Remove the engine cover.

For additional information, refer to: [Engine Cover - TDV6 2.7L Diesel \(501-05 Interior Trim and Ornamentation, Removal and Installation\)](#).

5. **NOTE:** Remove and discard the O-ring seal.

Remove the oil filter element housing.

- Rotate the oil filter element housing five complete turns counter-clockwise.
- Allow the engine oil to drain from the oil filter element housing for two minutes.
- Remove the oil filter element housing.

E52590

6. Using the special tool, remove and discard the oil filter element.

E50865

7. Install a new oil filter element.

E56283

8. NOTE: Install a new O-ring seal.

Install the oil filter element housing.

- Tighten to 25 Nm.

E52590

9. NOTE: Install a new seal.

Install the drain plug.

- Tighten to 25 Nm.

E95114

10. Install the air deflector.

For additional information, refer to: Air Deflector (501-02, Removal and Installation).

11. Fill the engine with oil.

12. Start engine and run at idle speed until the oil pressure warning light extinguishes.

- Stop the engine.
- Check for leaks.

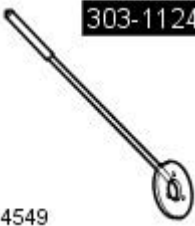

13. Check and top-up the engine oil if required.

14. Install the engine cover.

For additional information, refer to: [Engine Cover - TDV6 2.7L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Engine - TDV6 2.7L Diesel - Camshaft Front Seal

Removal and Installation

Special Tool(s)	
 <p>303-1124</p> <p>E54549</p>	Holder - Camshaft Pulleys Front 303-1124
 <p>303-1119</p> <p>E54542</p>	Installer - Camshaft Oil Seal 303-1119
 <p>303-1118</p> <p>E54541</p>	Remover - Camshaft Oil Seal 303-1118
 <p>303-1126</p> <p>E54551</p>	Timing Pin - Camshaft Pulleys 303-1126

Removal

1. Disconnect the battery ground cable.
 For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the timing belt.
 For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

4.  **CAUTION:** Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

Remove the special tool.

- Stage one: Retain the camshaft pulley.
- Stage two: Remove the special tool.

5. Remove the camshaft pulley.

- Remove the three retaining bolts.

E54321

6. Using the special tool, remove the camshaft position (CMP) sensor timing plate.

- Remove and discard the retaining bolt.

E54322

7. Install the special tool to the camshaft.

E55870

8.  CAUTION: Make sure the special tool is correctly seated behind the camshaft seal. Failure to follow this instruction may result in damage to the special tool.

Install the special tool into the camshaft front seal.

E55871

9. Install the special tool into the camshaft front seal.

E55879

10. Install the special tool extracting bolt.

E56360

11. Using the special tool, remove the camshaft front seal.

E56361

Installation

E55872

1. CAUTIONS:

 Make sure the seal is installed correctly.

 Do not use any lubricant on the camshaft front seal or the camshaft. Failure to follow this instruction may result in damage to the vehicle.

• NOTE: Make sure that the seal is 1mm below the face of the cylinder head.

Using the special tool, install the camshaft front seal.

- Clean the component mating faces.
- Use the discarded camshaft pulley hub retaining bolt with the special tool.

2. Using the special tool, install the CMP sensor timing plate.

- Install a new retaining bolt.
- Tighten the retaining bolt in two stages:
- Stage one: Tighten to 80 Nm.
- Stage two: Tighten a further 80 degrees.

3. Install the camshaft pulley.

- Install the bolts, but do not tighten fully at this stage.

4.  **CAUTION:** Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

Install the special tool.

- Stage one: Retain the camshaft pulley.
- Stage two: Install the special tool.

5. Install the timing belt.

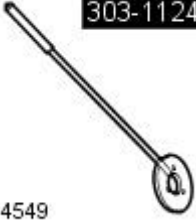

For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

6. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Removal**1. WARNINGS:**

Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Diesel fuel injection equipment is manufactured to very precise

tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Disconnect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the intake air shutoff throttle.

For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

3. Remove the fuel injector.

For additional information, refer to: [Fuel Injector](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

4.  **CAUTION:** Make sure the high-pressure fuel supply line remains in contact with both the fuel injector and the fuel injection supply manifold until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Remove the 2 remaining fuel injectors.

5. Remove the fuel injection pump belt.

For additional information, refer to: [Fuel Injection Pump Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

6. Detach the electrical connector from the left-hand valve cover.

7. Disconnect the electrical sensor.

8. Disconnect the electrical sensor.

9. Detach the engine harness.

10. Detach the engine harness.

11. Remove the engine harness retaining bolts.

12. Detach the engine breather tube.

13. Disconnect the vacuum pipe.

14. Remove the fuel injection pump supply line retaining bolt.

15. Clean the fuel pump, high pressure fuel supply line and surrounding areas.
For additional information, refer to: [Fuel Injection Component Cleaning](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, General Procedures).

16. CAUTIONS:

 Make sure the high-pressure fuel supply line remains in contact with both the fuel injector and the fuel injection supply manifold until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Make sure that the fuel injector adaptor union does not move when loosening the high-pressure fuel supply lines. Failure to follow this instruction may result in damage to the fuel injector or the fuel injector adaptor union.

Remove and discard the high-pressure fuel supply line.

- Loosen the high-pressure fuel supply line from the fuel injector and the fuel injection supply manifold.
- Install blanking caps to the exposed ports.

17. Remove the fuel injection supply manifold.

18. Remove the fuel injection supply manifold securing bracket.

19. Remove the engine cover locating studs.

20. Remove the LH valve cover.

- Remove and discard the valve cover gasket.

21. Remove the timing belt.

For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

22. Remove the special tool.

1. Retain the camshaft sprocket.
2. Remove the special tool.

23.  **CAUTION:** Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

Remove the camshaft sprocket.

- Remove the camshaft sprocket retaining bolts.

24. Using special tool, remove the camshaft sprocket hub.

- Remove the camshaft sprocket hub retaining bolt.

25. Remove the camshaft rear pulley retaining bolt.

- Using special tool, retain the camshaft rear pulley.
- Remove the special tool.

26. Remove the camshaft rear pulley.

27. Detach the EGR coolant inlet tube.

28. Detach the EGR coolant inlet tube.

29. Raise the vehicle.

30. Remove the LH catalytic converter.

For additional information, refer to: [Catalytic Converter](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).

31. Detach the EGR coolant inlet tube.

E52062

32. Remove the turbocharger heat shield.

E51188

33. Lower the vehicle.

34. Remove the fuel injection pump belt rear cover.

E52300

35. Retain the secondary timing chain tensioner plunger.

1. Reposition the secondary timing chain tensioner.

2. Retain the secondary timing chain tensioner plunger.

E52227

36. Remove the camshaft bearing caps evenly.

37. Remove the secondary timing chain tensioner retaining bolts.

38. Remove the LH bank camshafts and secondary timing chain tensioner assembly.

- Discard the LH exhaust camshaft seals.

39. Remove the secondary timing chain tensioner assembly.

40. Remove the camshafts.

- Remove the secondary timing chain from the camshafts.

Installation

1. WARNINGS:

 Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

 Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Make sure that the colored links on the secondary timing chain align with the dots and scribed line on the sprocket shoulder. Failure to follow this instruction may result in damage to the engine.

Install the camshafts.

- Install the secondary timing chain onto the camshafts.

2. Install the secondary timing chain tensioner assembly.

E86461

E52232

E52359

3.  CAUTION: Make sure that the dots on the camshafts are aligned at the 12 o'clock position. Failure to follow this instruction may result in damage to the engine.

• NOTE: Lubricate the camshafts and the camshaft bearing caps with oil meeting Jaguar specification prior to installation.

Install the camshafts.

- Use Hypoid oil to lubricate the camshafts.

4. Install the secondary timing chain tensioner retaining bolts.

- Tighten to 10 Nm.

E52229

5. Apply Loctite 518 sealant to the exhaust camshaft seal bearing caps.

- Apply Loctite 518 sealant, 2 mm wide, to the LH rear and RH front camshaft bearing caps.

- Apply Loctite 518 sealant, 7 mm diameter, to the LH front and RH rear camshaft bearing caps.

E53719

E52365

6. Install the camshaft bearing caps in their original positions.
- Tighten the retaining bolts in the sequence shown.
 - Stage 1: Bolts 1 to 14, 1 Nm.
 - Stage 2: Bolts 1 to 14, 5 Nm.
 - Stage 3: Bolts 1 to 14, 10 Nm.
 - Stage 4: Bolts 15 to 18, 1 Nm.
 - Stage 5: Bolts 15 to 18, 5 Nm.
 - Stage 6: Bolts 15 to 18, 10 Nm.

E52234

7. Remove the secondary timing chain tensioner retaining pin.

E52061

8. Install the LH valve cover.
- Install a new valve cover gasket.
 - Tighten to 10 Nm.

E50904

9. CAUTIONS:

A new camshaft front seal is supplied with a transit sleeve that must not be removed until the camshaft front seal is fully installed. Failure to follow this instruction may result in damage to the vehicle.

Do not use any lubricant on the camshaft front seal, transit sleeve or the camshaft. Failure to follow this instruction may result in damage to the vehicle.

- NOTE: Make sure all components are clean.

Using the special tool, install the camshaft front seal.

- Remove and discard the transit sleeve.

10. Using special tool, install the camshaft sprocket hub.

E50901

- Install the camshaft sprocket hub retaining bolt.
- Tighten the bolt in the sequence shown.
- Stage one: Tighten to 80 Nm.
- Stage two: Tighten a further 80 degrees.

11. NOTE: Loosely install all retaining bolts.

Install the camshaft sprocket.

- Install the camshaft sprocket retaining bolts.

E50900

12. Install the special tool.

E50899

13. Install the timing belt.

For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

14. Install the fuel injection pump belt rear cover.

- Tighten to 10 Nm.

E52300

15. Raise the vehicle.

16. Install the turbocharger heat shield.

- Tighten to 9 Nm.

E51188

17. Attach the EGR coolant inlet tube.

E52062

18. Install the LH catalytic converter.

For additional information, refer to: [Catalytic Converter](#) (309-00A Exhaust System - TDV6 2.7L Diesel, Removal and Installation).

19. Lower the vehicle.

20. Attach the EGR coolant inlet tube.

- Tighten to 10 Nm.

E52380

21. Attach the EGR coolant inlet tube.

E51795

22. CAUTIONS:

 A new camshaft front seal is supplied with a transit sleeve that must not be removed until the camshaft front seal is fully installed. Failure to follow this instruction may result in damage to the vehicle.

 Do not use any lubricant on the camshaft front seal, transit sleeve or the camshaft. Failure to follow this instruction may result in damage to the vehicle.

- NOTE: Make sure all components are clean.

Using the special tool, install the new camshaft rear seal.

- Remove and discard the transit sleeve.

E50784

23. Install the camshaft rear pulley.

24. Install the camshaft rear pulley retaining bolt.

- Install a new retaining bolt.
- Using special tool, retain the camshaft rear pulley.
- Tighten the bolt in the sequence shown.
- Stage one: Tighten to 80 Nm.
- Stage two: Tighten a further 80 degrees.
- Remove the special tool.

25. Install the fuel injection pump belt.

For additional information, refer to: [Fuel Injection Pump Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

26. Install the engine cover locating studs.

- Tighten to 10 Nm.

27. Install the fuel injection supply manifold securing bracket.

- Tighten to 24 Nm.

28. NOTE: Loosely install all retaining bolts.

Install the fuel injection supply manifold.

29. Install the fuel injector.

For additional information, refer to: [Fuel Injector](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

30. Install the 2 remaining fuel injectors.

31. Install the new high-pressure fuel supply lines.

- Remove and discard the blanking caps.
- Install the new high pressure fuel supply line, but do not fully tighten at this stage.
- Tighten the fuel injection supply manifold retaining bolts to 23 Nm.
- Tighten the high-pressure fuel supply line in the sequence shown in four stages.
- Stage 1: Tighten the high-pressure fuel supply line union 1 to 15 Nm.
- Stage 2: Tighten the high-pressure fuel supply line union 2 to 15 Nm.
- Stage 3: Tighten the high-pressure fuel supply line union 1 to 30 Nm.
- Stage 4: Tighten the high-pressure fuel supply line union 2 to 30 Nm.

32. Install the fuel injection pump supply line retaining bolt.

- Tighten to 10 Nm.

33. Connect the vacuum pipe.

34. Attach the engine breather pipe.

35. Install the engine harness retaining bolts.

- Tighten to 4 Nm.

36. Attach the engine wiring harness.

37. Attach the engine wiring harness.

38. Connect the electrical connector.

39. Connect the electrical connector.

40. Attach the electrical connector onto the valve cover.

41. Install the intake air shutoff throttle.

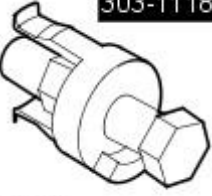

For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

42. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

 - Remove and discard the retaining bolt.

4. Remove the camshaft rear pulley.

5. Install the special tool to the camshaft.

E55612

E55613

6.  CAUTION: Make sure the special tool is correctly seated behind the camshaft seal. Failure to follow this instruction may result in damage to the special tool.

Install the special tool into the camshaft rear seal.

E55615

7.  CAUTION: Make sure the special tool is correctly seated behind the camshaft seal. Failure to follow this instruction may result in damage to the special tool.

Install the special tool into the camshaft rear seal.

E55616

8. Using the special tool, remove and discard the camshaft rear seal.

Installation

1. CAUTIONS:

 Make sure the seal is installed correctly.

 Do not use any lubricant on the camshaft rear seal or the camshaft. Failure to follow this instruction may result in damage to the vehicle.

• NOTE: Make sure that the seal is 1mm below the face of the cylinder head.

Using the special tool, install the camshaft rear seal.

- Clean the component mating faces.
- Use the discarded camshaft pulley hub retaining bolt with the special tool.

2. Install the camshaft rear pulley.

3. Using the special tool, install the camshaft rear pulley retaining bolt.

1. Stage one: Tighten to 80 Nm.
2. Stage two: Tighten a further 80 degrees.

4. Install the fuel injection pump belt.

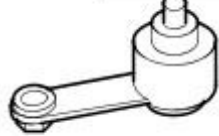

For additional information, refer to: [Fuel Injection Pump Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

5. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the timing belt.
For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

4. Remove the special tool.

5. Install the special tool.

6. Loosen the crankshaft pulley retaining bolt.

7. Using the special tool, release the crankshaft pulley.

E54297

8. Remove the crankshaft pulley.

- Remove the crankshaft pulley retaining bolt.
- Discard the bolt.

E54298

9. Install the special tool to the crankshaft.

E54299

10. Using the special tool, remove the crankshaft front seal.

- Remove the special tool.
- Remove and discard the seal from the special tool.

Installation

E54300

1.  **CAUTION:** Do not use any lubricant on the crankshaft front seal, special tools or the crankshaft. Failure to follow this instruction may result in damage to the vehicle.

• **NOTE:** Make sure that all the component mating faces are clean.

Install a new crankshaft front seal to the special tool.

2. Reposition the crankshaft front seal along the special tool.

- Remove the sleeve from the special tool.

E 54301

3. Install the special tool to the crankshaft.

E54302

4. Install the special tool to the crankshaft.

E54303

5. CAUTIONS:

 Make sure the seal is installed correctly.

 Make sure that the seal is seated 1mm under flush.

Using the special tool, install the crankshaft front seal.

- Use the discarded crankshaft bolt with the service tool.

E54304

6. Remove the special tool.

- Remove and discard the crankshaft pulley retaining bolt.

E54297

7. Install the crankshaft pulley.

- Install a new crankshaft pulley retaining bolt.
- Tighten the retaining bolt in two stages:
- Stage one: Tighten to 100 Nm.
- Stage two: Tighten a further 90 degrees.

8. Remove the special tool.

9. Install the special tool.

E54272

10. Install the timing belt.

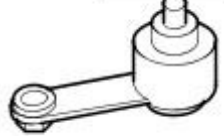

For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

11. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - TDV6 2.7L Diesel - Crankshaft Pulley

Removal and Installation

Special Tool(s)

 <p>303-D121</p> <p>E64849</p>	<p>General purpose puller</p> <p>303-D121</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove and discard the timing belt.
For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).
4. Remove the special tool.

5. Using the special tool, lock the flexplate.

6. Loosen the crankshaft pulley retaining bolt.

E50871

7. Using the special tool, release the crankshaft pulley.

E50872

8. Remove the crankshaft pulley.

- Remove the crankshaft pulley retaining bolt.
- Discard the bolt.

E54297

Installation

1. CAUTIONS:

Make sure that the pulley washer is correctly seated before installing the pulley.

Do not lubricate the components.

Install the crankshaft pulley.

- Install a new crankshaft pulley retaining bolt.
- Tighten the retaining bolt in two stages:
- Stage one: Tighten to 100 Nm.
- Stage two: Tighten a further 90 degrees.

E54297

2. Remove the special tool.

E54296

3. Install the special tool.

E54272

4. Install the timing belt.

For additional information, refer to: [Timing Belt](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

5. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - TDV6 2.7L Diesel - Crankshaft Rear Seal

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the crankshaft position (CKP) sensor ring.
For additional information, refer to: [Crankshaft Position \(CKP\) Sensor Ring](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Removal and Installation).
4. Remove the crankshaft rear seal retaining bolts.

5. Remove the crankshaft rear oil seal carrier.
 - Remove the retaining bolts.
 - Remove and discard the rear crankshaft oil seal.

Installation

1. CAUTIONS:

 Make sure that the crankshaft rear oil seal is correctly located.

 Make sure the crankshaft seal mating faces are clean and dry.

Apply an 8 mm bead of sealant to the cylinder block in the areas shown.

2. Install the crankshaft rear oil seal carrier.

- Lubricate the oil seal.

3. Install the retaining bolt.

- Tighten to 10 Nm.

4. Install the remaining retaining bolts.

- Tighten to 10 Nm.

E99334

5. Install the crankshaft rear seal retaining bolts.

- Tighten to 10 Nm.

E99329

6. Install the CKP sensor ring.

For additional information, refer to: [Crankshaft Position \(CKP\) Sensor Ring](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Removal and Installation).

7. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - TDV6 2.7L Diesel - Crankshaft Vibration Damper

Removal and Installation

Special Tool(s)

303-703

E95037

Accessory belt tensioner

303-703

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Raise and support the vehicle.
3. Remove the air deflector.
For additional information, refer to: Air Deflector (501-02, Removal and Installation).
4. Release the accessory drive belt.
 1. Using the special tool, rotate the accessory drive belt tensioner counter clockwise.
 2. Release the accessory drive belt.

5. Remove the crankshaft damper.
 1. Remove the 6 bolts.

Installation

1. Install the crankshaft damper.
 - Clean the components.
 - Tighten to 25 Nm.

2. Attach the accessory drive belt.

3. Install the air deflector.

For additional information, refer to: Air Deflector (501-02, Removal and Installation).

4. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - TDV6 2.7L Diesel - Cylinder Head LH

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).
3. Remove the left-hand camshafts.
For additional information, refer to: [Camshaft LH](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).
4. Remove the LH exhaust manifold.
For additional information, refer to: [Exhaust Manifold](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).
5. Detach the coolant expansion tank hose from the cylinder head coolant outlet assembly.

6. Detach the engine coolant hose from the cylinder head coolant outlet assembly.

7. Detach the radiator upper hose from the cylinder head coolant outlet assembly.

8. Remove the cylinder head coolant outlet assembly.

- Remove and discard the O-ring seals.

E52224

9. Reposition the fuel filter and support bracket.

E98992

10. Disconnect the EGR valve electrical connector.

E51793

11. Disconnect the coolant hose from the EGR valve.

E51794

12. Release the EGR valve.

13. Remove the EGR valve.

- Disconnect the coolant hose.

14. Remove the glow plugs.

For additional information, refer to: [Glow Plugs - 2.7L V6 - TdV6](#) (303-07C Glow Plug System, Removal and Installation).

15. Disconnect the camshaft position (CMP) sensor electrical connector.

16. Remove the hydraulic adjuster and rocker assemblies.

17.  CAUTION: Only use a plastic scraper to clean off the old gasket.

Remove the LH cylinder head assembly.

- Remove and discard the eight cylinder head bolts.
- Remove and discard the cylinder head gasket.

Installation

1. CAUTIONS:

 Use care when installing the cylinder head. Damage to the cylinder block, cylinder head or cylinder head gasket may result.

 The head gasket must be installed over the cylinder block dowels.

- NOTE: Install a new cylinder head gasket.
- NOTE: Tighten the retaining bolts in the indicated sequence in four stages.
- NOTE: No additional lubrication to the cylinder head bolts is required.

Install the LH cylinder head assembly and install new cylinder head retaining bolts.

- Stage 1: Tighten to 20 Nm.
- Stage 2: Tighten to 40 Nm.
- Stage 3: Tighten to 80 Nm.
- Stage 4: Tighten a further 180 degrees.

2. Install the hydraulic adjuster and rocker assemblies.

3. Connect the camshaft position (CMP) sensor electrical connector.

4. Install the glow plugs.
For additional information, refer to: [Glow Plugs - 2.7L V6 - TdV6 \(303-07C Glow Plug System, Removal and Installation\)](#).

5. Install the EGR valve.

- Connect the coolant hose.

E51797

6. Secure the EGR valve.

- Tighten to 10 Nm.

E52871

7. Connect the coolant hose to the EGR valve.

E51794

8. Connect the EGR valve electrical connector.

E51793

9. Secure the fuel filter and support bracket.

- Tighten to 27 Nm.

10. **NOTE:** Install new O-ring seals.

Install the cylinder head coolant outlet assembly.

- Tighten to 10 Nm.

11. Attach the radiator upper hose onto the cylinder head coolant outlet assembly.

12. Attach the engine coolant hose onto the cylinder head coolant outlet assembly.

13. Attach the coolant expansion tank hose onto cylinder head coolant outlet assembly.

14. Install the exhaust manifold.

For additional information, refer to: [Exhaust Manifold](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

15. Install the LH camshafts.

For additional information, refer to: [Camshaft LH](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

16. Fill and bleed the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).

17. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - TDV6 2.7L Diesel - Engine Mount LH

Removal and Installation

Special Tool(s)

Power train assembly jack

HTJ1200-2

Removal

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

Left-hand drive vehicles

4. Make sure the alignment mark, on the steering gear pinion seal protection cover, is central to the steering gear pinion casting.

E42703

VUJ0002958

5.  **CAUTION:** Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Remove the steering gear shaft pinch bolt.

6. Disconnect the power steering control valve actuator electrical connector.

7. Detach the steering gear.

8. Support the steering gear.

All vehicles

9. Remove the engine mounts lower retaining nuts.

10. Release the LH turbocharger intake tube.

11. Lower the vehicle.
12. Reposition the fuel filter and support bracket.

13. Using snap-on tool FRDHM15, remove the nut.

14. Raise the vehicle.
15. Using the special tool, raise and support the engine.
 - Raise the LH side of the engine.

16. NOTE: Right-hand shown, left-hand similar.
Remove the LH engine mount.

Installation

All vehicles

1. NOTE: Right-hand shown, left-hand similar.

Install the LH engine mount.

2. Using the special tools, lower the engine.

3. Lower the vehicle.

4. Using snap-on tool FRDHM15, install the nut.

- Tighten to 47 Nm.

5. Secure the fuel filter and support bracket.

- Tighten to 27 Nm.

6. Raise the vehicle.

7. Install the engine mount lower retaining nut.

- Tighten to 63 Nm.

8. Secure the LH turbocharger inlet tube.

Left-hand drive vehicles

9. Attach the steering gear.

- Tighten to 100 Nm.

10. Connect the power steering control valve actuator electrical connector.

11. Install the steering gear shaft pinch bolt.

- Tighten to 35 Nm.

All vehicles

12. Install the air deflector.

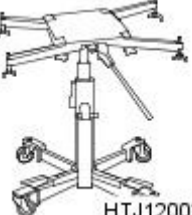

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

13. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - TDV6 2.7L Diesel - Engine Mount RH

Removal and Installation

Special Tool(s)

Removal

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

Right-hand drive vehicles

4. Make sure the alignment mark, on the steering gear pinion seal protection cover, is central to the steering gear pinion casting.

E42703

5.  CAUTION: Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Remove the steering gear shaft pinch bolt.

6. Disconnect the power steering control valve actuator electrical connector.

7. Detach the steering gear.

8. Support the steering gear.

All vehicles

9. Detach the starter motor solenoid harness.

10. Detach the starter motor cable.

11. Remove the right-hand turbocharger outlet pipe.

- Remove the bolt.
- Release the turbocharger outlet pipe clip.
- Detach the wiring harness clip.

E98753

12. Release the accessory drive belt.

13. Disconnect the battery positive cable from the generator.

14. Release and reposition the generator.

15. Disconnect the generator electrical connector.

16. Detach the engine mount.

17. Using the special tool, raise and support the engine.

- Raise the RH side of the engine by approximately 15 mm.

18. Release the engine mount bracket.

19. Detach the engine mounting bracket.

20. Remove the RH engine mount.

Installation

All vehicles

1. Install the RH engine mount.

2. Attach the RH engine mount bracket.

- Tighten to 47 Nm.

3. Secure the engine mount bracket.

- Tighten to 90 Nm.

4. Using the special tools, lower the engine.

5. Attach the engine mount.

- Tighten to 63 Nm.

6. Connect the generator electrical connector.

7. Secure the generator.

- Tighten to 47 Nm.

8. Connect the battery positive cable to the generator.

- Tighten to 20 Nm.

9. Attach the accessory drive belt.

10. Install the right-hand turbocharger outlet pipe.

- Install the retaining bolt.
- Secure the turbocharger outlet pipe clip.
- Attach the wiring harness clip.

E98753

11. Attach the starter motor cable.

- Tighten to 10 Nm.

E50719

12. Attach the starter motor solenoid harness.

- Tighten to 7 Nm.

E50718

Right-hand drive vehicles

E31036

13. Attach the steering gear.

- Tighten to 100 Nm.

E49770

14. Connect the power steering control valve actuator electrical connector.

VUJ0002958

15. Install the steering gear shaft pinch bolt.

- Tighten to 35 Nm.

16. Install the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

17. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - TDV6 2.7L Diesel - Exhaust Manifold

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the RH turbocharger.
For additional information, refer to: [Turbocharger RH](#) (303-04B Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Removal and Installation).
4. Disconnect the EGR valve inlet tube.
 - Discard the gasket.

E52851

5. Remove the exhaust manifold front heat shield.

E51029

6. Remove the exhaust manifold heat shield.

E51028

7. NOTE: New exhaust manifold retaining studs must be fitted if the old studs are removed.

Remove the exhaust manifold.

- Remove and discard the retaining nuts.

8. Remove and discard the exhaust manifold gasket.

Installation

1. NOTE: New exhaust manifold retaining studs must be fitted if the old studs are removed.

To install, reverse the removal procedure.

- Install a new exhaust manifold gasket.
- Install new retaining nuts.
- Tighten to 23 Nm.

2. Tighten to 10 Nm.

3. Tighten to 10 Nm.

E51029

4. Tighten to 10 Nm.

E52851

Engine - TDV6 2.7L Diesel - Flexplate

Removal and Installation

2. Raise and support the vehicle.
3. Remove the automatic transmission.
4. Remove the starter motor retaining bracket.

E51240

5. Detach the starter motor solenoid harness.

E50718

6. Detach the starter motor cable.

E50719

7. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the starter motor.

8. Install the special tool.

9. NOTE: Prevent the flexplate from rotating.

Remove the flexplate.

- Remove and discard the bolts.

Installation

1. NOTE: Make sure that all the component mating faces are clean.

- NOTE: Loosely install all retaining bolts.

Install the flexplate.

- Prevent the flexplate from rotating.
- Install new retaining bolts.

2. CAUTION: Tighten the bolts evenly in the stages shown.

Tighten the flexplate securing bolts.

- Stage 1: Tighten to 50 Nm.
- Stage 2: Tighten to 45 degrees.
- Stage 3: Tighten to 45 degrees.

3. Remove the special tool.

E50870

4. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Install the starter motor.

E51242

5. Tighten to 10 Nm.

E50719

6. Tighten to 7 Nm.

E50718

7. Tighten to 23 Nm.

E51240

8. Install the automatic transmission.

9. Connect the battery ground cable.

Engine - TDV6 2.7L Diesel - Oil Filter Element

Removal and Installation

Special Tool(s)	
 <p>303-1128</p> <p>E54553</p>	<p>Remover - Oil Filter Element</p> <p>303-1128</p>

Removal

1. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 2.7L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

2. Remove the oil filter element housing.

- Rotate the oil filter element housing five complete turns counter-clockwise.
- Allow the engine oil to drain from the oil filter element housing for two minutes.
- Remove the oil filter element housing.

3. **NOTE:** Remove and discard the O-ring seal.

Using the special tool, remove the oil filter element.

Installation

1. **NOTE:** Install a new O-ring seal.

Install the oil filter element.

2. Install the oil filter element housing.

- Tighten to 25 Nm.

3. Install the engine cover.

For additional information, refer to: [Engine Cover - TDV6 2.7L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

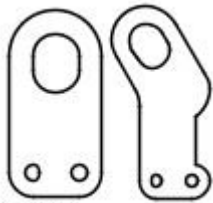

4. Check and top-up the engine oil.

5. Start and run the engine.

6. Check and if necessary top up the engine oil.

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 2.7L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Install the special tool.

5. Install the special tool.

6. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).
7. Drain the engine oil.
For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 2.7L Diesel, General Procedures).

8. Make sure the alignment mark, on the steering gear pinion seal protection cover, is central to the steering gear pinion casting.

9.  CAUTION: Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Remove the steering gear shaft pinch bolt.

10. Disconnect the power steering control valve actuator electrical connector.

11. Detach the steering gear.

12. Support the steering gear.

E 31035

13. Loosen the RH turbocharger outlet tube securing clips.

E 63593

14. Remove the RH turbocharger outlet tube.

E 63592

15. Remove the LH engine mount retaining nut.

E 63598

16. Lower the vehicle.

17. Raise the LH side of the engine.

E 51613

18. Raise the vehicle.

19. Disconnect the engine oil temperature sensor electrical connector.

E 63630

E63620

20. Reposition the oil pan.

- Remove the 21 bolts.

21. Remove the oil strainer bolt.

E52335

22. Reposition the oil strainer.

E52336

23. NOTE: Discard the gasket.

Remove the oil pan.

E52338

24. NOTE: Remove and discard the O-ring seal.

Remove the oil strainer pick-up assembly.

25. NOTE: Do not disassemble further if the component is removed for access only.

• NOTE: Remove and discard the O-ring seal.

Remove the engine oil temperature sensor.

Installation

1. CAUTIONS:

Make sure that the mating faces are clean and free of foreign material.

Install a new seal.

Install the oil temperature sensor.

- Tighten to 24 Nm.

2.  CAUTION: Install a new seal.

• NOTE: Make sure that all the components are clean.

• NOTE: Do not fully install the component at this stage.

Position the oil strainer pick-up assembly.

3. NOTE: Make sure that all the component mating faces are clean.

• NOTE: Install a new gasket.

• NOTE: Do not fully install the component at this stage.

Position the oil pan.

4. Install the oil strainer pick-up assembly.

- Tighten to 10 Nm.

5. Install the oil pan.

6.  **CAUTION:** Make sure the gasket is installed correctly.

Install the 21 bolts.

- Tighten to 10 Nm.

7. Connect the engine oil temperature sensor electrical connector.

8. Lower the engine onto the engine mount.

9. Install the LH engine mount retaining nut.

- Tighten to 63 Nm.

10. Install the RH turbocharger outlet tube.

11. Install the RH turbocharger outlet tube retaining bolt.

- Tighten to 10 Nm.

12. Install the steering gear.

- Tighten to 100 Nm.

13. NOTE: Align to the position noted on removal.

Connect the steering column lower shaft.

- Tighten to 35 Nm.

14. Connect the steering gear control valve actuator electrical connector.

15. Install the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

16. Remove the engine support.

17. Install the engine cover.

For additional information, refer to: [Engine Cover - TDV6 2.7L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

18. Fill the engine with the recommended oil to the correct level.

For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 2.7L Diesel, General Procedures).

19. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

18. NOTE: Discard the gasket.

Remove the oil pan.

19. NOTE: Remove and discard the O-ring seal.

Remove the oil strainer pick-up assembly.

20. Remove the air conditioning (A/C) pipe retaining bolt.

21. Remove the turbocharger outlet pipe retaining bolt.

22. Disconnect the LH turbocharger outlet pipe.

23. Remove the LH turbocharger outlet pipe.

24. Remove the starter motor retaining bracket.

25. Disconnect the battery positive cable from the starter motor solenoid.

26. Disconnect the switch lead from the starter motor solenoid.

27. Remove the starter motor.

28. Release the oil temperature sensor harness.

29. Remove the A/C compressor lower retaining bolt.

30. Remove the bolt from the accessory drive belt tensioner bracket.

31. Remove the charge air cooler pipe retaining bolt.

E93293

32. NOTE: Discard the gasket.

Remove the oil pan extension.

E93419

Installation

1. Clean the component mating faces.

2. Apply an 8 mm bead of sealant to the cylinder block in the areas shown. For additional information, refer to: [Specifications](#) (303-01A Engine - TDV6 2.7L Diesel, Specifications).

E93678

3. NOTE: Install a new gasket.

- NOTE: Loosely install all retaining bolts.

Install the oil pan extension.

4.  CAUTION: Tighten the bolts in the sequence shown.

- NOTE: The retaining bolts must be tightened within twenty minutes of applying the sealant.

Tighten the oil pan extension retaining bolts in the sequence shown.

E93676

1. Tighten bolts A to 10 Nm.
2. Tighten bolts B to 4 Nm.
3. Tighten bolts A to 24 Nm.
4. Tighten bolts B to 10 Nm.

5. Tighten the charge air cooler retaining bolt.

- Tighten to 10 Nm.

E93293

6. Install the accessory drive belt tensioner bracket bolt.

- Tighten to 24 Nm.

E93292

7. Install the A/C compressor lower bolt.

- Tighten to 24 Nm.

E93291

8. Secure the oil temperature sensor harness clip.

E93290

9. NOTE: Make sure that all the component mating faces are clean.

Install the starter motor.

- Tighten to 48 Nm.

10. Connect the starter motor solenoid electrical connector.

11. Connect the battery positive cable to the starter motor solenoid.

- Tighten to 10 Nm.

12. Install the starter motor support bracket.

- Tighten to 23 Nm.

13. Install the LH turbocharger outlet pipe and secure with the clips.

- Tighten to 5 Nm.

14. Install the LH turbocharger outlet pipe bolt.

- Tighten to 24 Nm.

15. Install the A/C pipe retaining bolt.

- Tighten to 24 Nm.

16.  CAUTION: Install a new seal.

- NOTE: Make sure that all the components are clean.
- NOTE: Do not fully install the component at this stage.

Position the oil strainer pick-up assembly.

17. NOTE: Make sure that all the component mating faces are clean.

- NOTE: Install a new gasket.
- NOTE: Do not fully install the component at this stage.

Position the oil pan.

18. Install the oil strainer pick-up assembly.

- Tighten to 10 Nm.

19. Install the oil pan.

20.  CAUTION: Make sure the gasket is installed correctly.

Install the 21 bolts.

- Tighten to 10 Nm.

21. Connect the engine oil temperature sensor electrical connector.

22. Lower the engine onto the engine mount.

23. Install the LH engine mount retaining nut.

- Tighten to 63 Nm.

24. Install the steering gear.

- Tighten to 100 Nm.

25. NOTE: Align to the position noted on removal.

Connect the steering column lower shaft.

- Tighten to 35 Nm.

26. Connect the steering gear control valve actuator electrical connector.

27. Fill the engine with the recommended oil to the correct level.

For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - TDV6 2.7L Diesel, General Procedures).

28. Install the transmission assembly.

For additional information, refer to: [Transmission - TDV6 2.7L Diesel](#) (307-01 Automatic Transmission/Transaxle - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol/TDV6 2.7L Diesel, Removal).

29. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - TDV6 2.7L Diesel - Oil Pump

Removal and Installation

Removal

1. Disconnect the battery ground cable. For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the crankshaft front oil seal.
For additional information, refer to: [Crankshaft Front Seal](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the oil pan extension.
For additional information, refer to: [Oil Pan Extension](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).
5. Release the accessory drive belt tensioner.
 - Remove the bolt.

6. Release the RH turbocharger outlet pipe clip.

7. Remove the RH turbocharger outlet pipe.
 - Remove the bolt.
 - Release the clip.

8. Disconnect the generator electrical connector.

E50944

9. Disconnect the battery positive cable from the generator.

- Reposition the battery positive cable connector cover.
- Remove the nut.

E50946

10. Remove the 2 lower bolts from the generator.

E50947

11. Release the generator.

- Remove the generator upper bolt.
- Reposition the generator.
- Using a suitable tie strap, secure the generator to the front subframe.

E50949

12. NOTE: The generator mounting bracket upper rear bolt cannot be fully removed until the generator mounting bracket has been detached from the engine.

Remove the generator mounting bracket.

- Remove the 4 bolts.

E54914

13. Remove the timing belt idler pulley.

- Remove the bolt.

14. Remove the timing belt cover sealing strips.

15. Remove the oil pump.

- Remove the 10 bolts.
- Remove and discard the gasket.

Installation

1. Prime the oil pump.

1. Fill the orifice shown with 20 ml of engine oil. For additional information, refer to: [Specifications](#) (303-01A Engine - TDV6 2.7L Diesel, Specifications).
2. Rotate the oil pump drive 2 complete turns.

E123911

E123913

E123912

2. CAUTIONS:

 Make sure that the mating faces are clean and free of foreign material.

 Make sure the gasket is installed correctly.

Install the oil pump.

- Clean the component mating faces.
- Install a new gasket.
- Lightly tighten the bolts in the position shown.

3.  CAUTION: Make sure the base of the oil pump is aligned within 0.2 mm of the base of the engine block. Failure to follow this instruction may result in damage to the vehicle.

• NOTE: Vehicles fitted with oil pumps without dowels.

Check the oil pump to engine block alignment.

4. Secure the oil pump.

- Tighten the bolts in the sequence shown to 10 Nm .

5. Install timing belt cover sealing strips.

6. Install the timing belt idler pulley.

- Tighten the bolt to 45 Nm.

E125155

7. Install the generator mounting bracket.

- Loosely install the 4 bolts.
- Tighten the 4 bolts in the sequence shown to 23 Nm.

8. Install the generator.

- Tighten the bolts to 47 Nm (35 lb.ft).

9. Connect the generator electrical connectors.

- Tighten the nut to 12 Nm.
- Connect the generator electrical connection.

10. Install the RH turbocharger outlet tube.

- Secure the 2 clips.

11. Install the accessory drive belt tensioner.

- Tighten the bolt to 47 Nm (35 lb.ft).

12. Install the oil pan extension.

For additional information, refer to: [Oil Pan Extension](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

13. Install the crankshaft front oil seal.

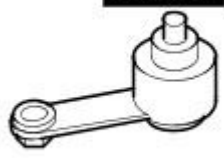

For additional information, refer to: [Crankshaft Front Seal](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

14. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - TDV6 2.7L Diesel - Timing Belt

Removal and Installation

 <p>303-1126</p> <p>E54551</p>	<p>Timing Pin - Camshaft Pulleys</p> <p>303-1126</p>
 <p>303-1117</p> <p>E54540</p>	<p>Timing Pin - Automatic Transmission</p> <p>303-1117</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the timing cover.
For additional information, refer to: [Timing Cover](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).
3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
4. Remove the starter motor retaining bracket.

5. Release the starter motor solenoid harness.

6. Release the starter motor cable.

7. Release the starter motor.

8. Remove the crankshaft timing alignment grommet from the engine block.

9. Rotate the crankshaft clockwise to align the crankshaft alignment hole in the flywheel or flexplate with the block aperture.

10. Check the camshaft pulley alignment holes are correctly aligned. If the alignment holes are not aligned, rotate the crankshaft one full turn clockwise.

11. Using the special tool, lock the flexplate.

- Install a starter motor bolt to retain the special tool.

12. Remove the accessory drive belt pulley and bracket assembly.

- Remove the 3 retaining bolts.

13. Install the special tools to the exhaust camshaft pulleys.

14.  **CAUTION:** Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

Loosen the six exhaust camshaft pulley damper retaining bolts.

- Using a suitable tool, counterhold the camshaft pulley center retaining bolts.

15. Remove and discard the timing belt tensioner.

- Remove and discard the bolt.

16. Remove and discard the timing belt.

E 54277

Installation

1. Rotate both camshaft pulleys clockwise.

E 54278

2. Install a new timing belt tensioner.

- Install a new bolt, but do not fully tighten at this stage.

E52977

3.  **CAUTION:** Make sure the camshaft pulleys remain in the clockwise position.

Install the new timing belt.

- Starting at the crankshaft pulley, install the timing belt in a counter-clockwise direction, in the sequence shown.
- Stage one: Attach the timing belt to the crankshaft pulley.
- Stage two: Attach the timing belt to the idler pulley.
- Stage three: Attach the timing belt to the left-hand camshaft pulley.
- Stage four: Attach the timing belt to the idler pulley.
- Stage five: Attach the timing belt to the RH camshaft pulley.
- Stage six: Attach the timing belt to the timing belt tensioner.

E54280

E54281

4.  CAUTION: Make sure the timing belt tensioner window is aligned with the groove.

Tension the timing belt.

- Rotate the tensioner assembly counter-clockwise.
- Tighten to 24 Nm.

E54627

5.  CAUTION: Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

Using a suitable tool, counterhold the camshaft pulley center retaining bolts.

- Tighten the six exhaust camshaft pulley damper retaining bolts.
- Tighten to 23 Nm.

E54274

6. Remove the special tools from the camshaft pulleys.

7. Remove the special tool from the flexplate.

8.  CAUTION: Only rotate the crankshaft clockwise.

Rotate the engine two complete turns clockwise.

9. Using the special tool, lock the flexplate.

- Install a starter motor bolt to retain the special tool.

E54272

E54282

10. Install the special tools to the exhaust camshaft pulleys.

- If the special tool does not fit correctly, repeat the timing belt installation procedure.
- Remove the special tools from the camshaft pulleys.

E65310

11. Install the accessory drive belt pulley and bracket assembly.

- Tighten to 80 Nm.

E54272

12. Remove the special tool from the flexplate.

- Install the grommet.

E51242

13. Install the starter motor.

- Tighten to 48 Nm.

14. Connect the starter motor cable.

- Tighten to 10 Nm.

15. Connect the starter motor solenoid electrical connector.

- Tighten to 7 Nm.

16. Install the starter motor retaining bracket.

- Tighten to 23 Nm.

17. Install the timing cover.

For additional information, refer to: [Timing Cover](#) (303-01A Engine - TDV6 2.7L Diesel, Removal and Installation).

18. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - TDV6 2.7L Diesel - Timing Cover

Removal and Installation

Accessory belt tensioner

303-703

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
- Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 2.7L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
- Remove the air cleaner.
For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).
- Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

- Release the coolant hose.

- Disconnect the engine coolant temperature (ECT) sensor electrical connector.

8. Detach the ECT sensor wiring harness.

9. Release the exhaust gas recirculation (EGR) valve outlet tube from the timing cover.

- Remove the retaining bolt.

10. Reposition the oil level indicator tube.

- Remove the retaining bolt.

11. Remove the LH timing cover.

- Remove and discard the gasket.

12. Release the coolant expansion tank hose from the clips.

13. Remove the retaining bolt.

14. Disconnect the electrical connector.

15. Release the intake air shutoff throttle elbow.

- Release the retaining clip.

16. Remove the charge air cooler inlet hose.

17. Release the coolant hose.

18. Release the port deactivation valve retaining bracket.

E 64853

19. Release the air temperature sensor wiring harness.

- Release the 2 wiring harness clips.

E51149

20. Release the EGR valve outlet tube from the timing cover

- Remove the retaining bolt.

E51150

21. Remove the RH timing cover.

- Remove and discard the gasket.

E51151

22. Remove the crankshaft damper.

E51058

23. Release the charge air cooler hose.

1. Remove the hose clamp.
2. Remove the retaining bolt.

24. Remove the charge air hose.

25.  CAUTION: Discard the bolts.

• NOTE: Using a suitable bar lock the coolant pump pulley.

Remove the coolant pump pulley.

- Remove the 3 coolant pump pulley retaining bolts.

26. Remove the lower timing cover.

- Remove and discard the gasket.

Installation

E52801

1. NOTE: Install a new gasket.

Install the lower timing cover.

- Tighten to 10 Nm.

E52800

2. NOTE: Make sure that new bolts are installed.

Install the coolant pump pulley.

- Tighten to 24 Nm.

E52798

3. Install the charge air cooler hose.

1. Tighten to 4 Nm.

2. Tighten to 8 Nm.

E51058

4. Install the crankshaft damper.

- Tighten to 14 Nm.

E51151

5. NOTE: Install a new gasket.

Install the RH timing cover.

- Tighten to 10 Nm.

6. Secure the EGR valve outlet tube to the timing cover.

- Tighten to 4 Nm.

7. Attach the air temperature sensor wiring harness.

8. Secure the port deactivation valve retaining bracket.

- Tighten to 8 Nm.

9. Secure the coolant hose.

10. Install the charge air cooler hose.

- Tighten to 8 Nm.

11. Secure the intake air shutoff throttle elbow.

- Install the retaining clip.

12. Connect the electrical connector.

13. Install the retaining bolt.

14. Secure the coolant expansion tank hose.

15. NOTE: Install a new gasket.

Install the LH timing cover.

- Tighten to 10 Nm.

16. Install the oil level indicator tube.

- Tighten to 3 Nm.

E51080

17. Install the EGR valve outlet tube to the timing cover.

- Tighten to 3 Nm.

E51079

18. Secure the ECT sensor wiring harness.

E51078

19. Connect the ECT sensor electrical connector.

E51077

20. Secure the coolant hose.

E51076

21. Install the accessory drive belt.

For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

22. Install the air cleaner.

For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).

23. Install the engine cover.

For additional information, refer to: [Engine Cover - TDV6 2.7L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

24. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Removal

1. WARNINGS:

 Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

 Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Disconnect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2.  WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the secondary bulkhead center panel.
For additional information, refer to: [Secondary Bulkhead Center Panel](#) (501-02 Front End Body Panels, Removal and Installation).
4. Remove the intake air shutoff throttle.
For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).
5. Remove the air cleaner assembly.
For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).
6. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

7. Release the accessory drive belt.

1. Using the special tool, rotate the accessory drive belt tensioner counter-clockwise.

8. Release the coolant hose retaining clip.

9. Disconnect the engine coolant temperature (ECT) sensor electrical connector.

10. Detach the coolant temperature sensor wiring harness.

11. Remove the oil level indicator tube retaining bolt.

- Reposition the oil level indicator tube.

12. Remove the LH timing cover.

- Remove and discard the gasket.

13. Remove the engine compartment brace.

14. Remove the fuel injector.

For additional information, refer to: [Fuel Injector](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

15. Remove the 2 remaining fuel injectors.

16. Detach the electrical connector from the left-hand valve cover.

17. Disconnect the electrical connector.

18. Disconnect the electrical connector.

19. Detach the engine harness.

20. Remove the cover from the engine wiring harness casing.

- Release the 7 retaining clips.

21. Remove the engine wiring harness casing.

- Remove the 4 retaining bolts.

22. Remove the engine breather hose.

23. Disconnect the vacuum pipe.

24. Remove the fuel injection pump supply line retaining bolt.

25.  CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Remove and discard the high-pressure fuel supply line.

- Install blanking caps to the exposed ports.

26. Remove the LH fuel injection supply manifold.

27. Remove the fuel injection supply manifold securing bracket.

28. Remove the engine cover locating studs.

29. Remove the LH valve cover.

- Remove and discard the gasket.

Installation

1. WARNINGS:

 Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

 Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Install the LH valve cover.

- Install a new gasket.
- Tighten to 10 Nm.

2. Install the engine cover locating studs.

- Tighten to 10 Nm.

3. Install the fuel injection supply manifold securing bracket.

- Tighten to 24 Nm.

4. NOTE: Loosely install all retaining bolts.

Install the LH fuel injection supply manifold.

5. Install the fuel injector.

For additional information, refer to: [Fuel Injector](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

6. Install the 2 remaining fuel injectors.

7. Install a new high-pressure fuel supply line.

- Remove the blanking caps from the ports.
- Loosely install the new high-pressure fuel supply line.
- Tighten the fuel injection supply manifold retaining bolts to 23 Nm (17 lb.ft).
- Tighten the fuel injection supply line unions in the sequence shown in four stages:
 - Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
 - Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 15 Nm (11 lb.ft).
 - Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).
 - Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 30 Nm (22 lb.ft).

8. Install the fuel injection pump supply line retaining bolt.

- Tighten to 10 Nm.

9. Connect the vacuum pipe.

10. Install the engine breather hose.

11. Install the engine wiring harness casing.

12. Install the engine wiring harness cover.

13. Attach the engine wiring harness.

E52052

14. Connect the electrical connector.

E52051

15. Connect the electrical connector.

E52049

16. Attach the electrical connector onto the valve cover.

E52048

17. Install the engine compartment brace.

- Tighten to 25 Nm.

E98676

18. NOTE: Install a new gasket.

Install the LH timing cover.

- Tighten to 10 Nm.

19. Install the oil level indicator tube.

- Tighten the bolt to 3 Nm (2.2 lb.ft).

20. Refit the engine coolant temperature sensor wiring harness.

21. Connect the engine coolant temperature (ECT) sensor electrical connector.

22. Install the coolant hose retaining clip.

23. Raise the vehicle.

24. Attach the accessory drive belt.

- Using the special tool, rotate the accessory drive belt tensioner counter-clockwise.

25. Install the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

26. Install the air cleaner assembly.

For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).

27. Install the intake air shutoff throttle.

For additional information, refer to: [Intake Air Shutoff Throttle](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

28. Install the secondary bulkhead center panel.

For additional information, refer to: [Secondary Bulkhead Center Panel](#) (501-02 Front End Body Panels, Removal and Installation).

29. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - TDV6 2.7L Diesel - Valve Cover LH

Removal and Installation

Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Disconnect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the secondary bulkhead center panel.

For additional information, refer to: [Secondary Bulkhead Center Panel](#) (501-02 Front End Body Panels, Removal and Installation).

3. Remove the air cleaner assembly.

For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).

4. Release the fuel filter assembly and position aside.

E112880

5. Remove the fuel filter bracket.

- Remove the 2 nuts.

6. Remove the oil level indicator tube retaining bolt.

- Reposition the oil level indicator tube.

7. Release the Left hand timing cover.

- Remove the 6 bolts.
- Release from the cylinder head.

8. Remove the engine compartment brace.

9. Remove the fuel injection pump supply line retaining bolt.

10.  CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Remove and discard the high-pressure fuel supply line.

- Install blanking caps to the exposed ports.

11. Remove the fuel injector.

For additional information, refer to: [Fuel Injector](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

12. Remove the 2 remaining fuel injectors.

13. Detach the electrical connector from the valve cover.

14. Release the left hand knock sensor (KS) electrical connector.

15. Disconnect the left hand KS electrical connector.

16. Remove the cover from the engine wiring harness casing.

- Release the 7 retaining clips.

17. Remove the engine wiring harness casing.

- Remove the 4 retaining bolts.

18. Disconnect the swirl plate actuator vacuum hose.

19. Detach the engine harness.

20. Remove the engine breather hose.

21. Remove the left hand fuel injection supply manifold.

22. Remove the fuel injection supply manifold securing bracket.

23. Remove the engine cover locating studs.

24. Remove the left hand valve cover.

- Remove and discard the gasket.

Installation

1. WARNINGS:

-  Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.
-  Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.
-  This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.
-  Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

-  Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.
-  Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.
-  Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Install the left hand valve cover.

- Install a new gasket.
- Tighten to 10 Nm.

2. Install the engine cover locating studs.

- Tighten to 10 Nm.

3. Install the fuel injection supply manifold securing bracket.

- Tighten to 24 Nm.

4. NOTE: Loosely install all retaining bolts.

Install the left hand fuel injection supply manifold.

5. Install the fuel injector.

For additional information, refer to: [Fuel Injector](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

6. Install the 2 remaining fuel injectors.

7. Install a new high-pressure fuel supply line.

- Remove the blanking caps from the ports.
- Loosely install the new high-pressure fuel supply line.
- Tighten the fuel injection supply manifold retaining bolts to 23 Nm (17 lb.ft).
- Tighten the fuel injection supply line unions in the sequence shown in four stages:
 - Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
 - Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 15 Nm (11 lb.ft).
 - Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).
 - Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 30 Nm (22 lb.ft).

8. Install the fuel injection pump supply line retaining bolt.

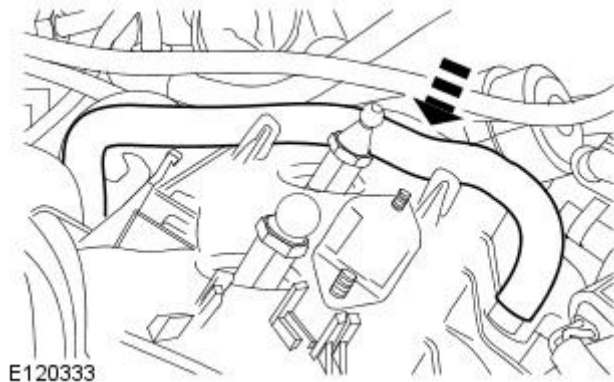

- Tighten to 10 Nm.

9. Connect the swirl plate actuator vacuum hose.

10. Install the engine breather hose.

E120333

11. Install the engine wiring harness casing.

E64524

12. Install the engine wiring harness cover.

E64521

13. Attach the engine wiring harness.

E120332

14. Connect the left hand KS electrical connector.

15. Secure the left hand KS electrical connector.

16. Attach the electrical connector onto the valve cover.

17. Install the engine compartment brace.

- Tighten to 25 Nm.

18. NOTE: Install a new gasket.

Attach the left hand timing cover.

- Tighten to 10 Nm.

E51081

19. Install the oil level indicator tube.

- Tighten the bolt to 3 Nm (2.2 lb.ft).

E51080

20. Install the fuel filter bracket.

- Tighten to 25 Nm.

21. Secure the fuel filter assembly.

E112880

22. Install the air cleaner assembly.

For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).

23. Install the secondary bulkhead center panel.

For additional information, refer to: [Secondary Bulkhead Center Panel](#) (501-02 Front End Body Panels, Removal and Installation).

24. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - TDV6 2.7L Diesel - Valve Cover RH

Removal and Installation

Removal

1. WARNINGS:

Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Disconnect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the secondary bulkhead center panel.

For additional information, refer to: [Secondary Bulkhead Center Panel](#) (501-02 Front End Body Panels, Removal and Installation).

3. Detach the coolant hose.

E51272

4. Remove the intake air shut off throttle elbow bolt.

5. Disconnect the air charge temperature sensor electrical connector.

6. Detach the intake air shut off throttle elbow.

- Release the clip.
- Position aside.

7. Release the port deactivation solenoid and bracket assembly.

- Remove the 3 bolts.
- Position aside.

8. Release the right hand timing cover.

- Remove the 5 bolts.
- Release from the cylinder head.

E51151

9. Disconnect the manifold absolute pressure (MAP) sensor and the fuel pressure sensor electrical connectors.

E112902

10. Disconnect the right hand knock sensor (KS) electrical connector.

- Release from the valve cover.
- Disconnect the electrical connector.

E112904

11. Remove the cover from the engine wiring harness casing.

- Release the 7 retaining clips.

E64521

12. Remove the engine wiring harness casing.

- Remove the 4 retaining bolts.

13. Disconnect the 2 vacuum lines from the brake vacuum pump.

- Position aside.

14. Disconnect the swirl plate actuator vacuum hose.

15. NOTE: LH illustration shown, RH is similar.

Detach the engine harness.

16. NOTE: LH illustration shown, RH is similar.

Remove the engine breather hose.

17. NOTE: LH illustration shown, RH is similar.

Remove the fuel injection pump supply line retaining bolt.

18.  CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

• NOTE: LH illustration shown, RH is similar.

Remove and discard the high-pressure fuel supply line.

- Install blanking caps to the exposed ports.

19. Remove the fuel injector.

For additional information, refer to: [Fuel Injector](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

20. Remove the 2 remaining fuel injectors.

21. NOTE: LH illustration shown, RH is similar.

Remove the right hand fuel injection supply manifold.

22. NOTE: LH illustration shown, RH is similar.

Remove the fuel injection supply manifold securing bracket.

23. NOTE: LH illustration shown, RH is similar.

Remove the engine cover locating studs.

24. Remove the right hand valve cover.

- Remove and discard the gasket.

Installation

1. WARNINGS:

 Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

 Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Install the right hand valve cover.

- Install a new gasket.
- Tighten to 10 Nm.

2. Install the engine cover locating studs.

- Tighten to 10 Nm.

3. Install the fuel injection supply manifold securing bracket.

- Tighten to 24 Nm.

4. NOTE: Loosely install all retaining bolts.

Install the right-hand fuel injection supply manifold.

5. Install the fuel injector.

For additional information, refer to: [Fuel Injector](#) (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

6. Install the 2 remaining fuel injectors.

7. Install a new high-pressure fuel supply line.

- Remove the blanking caps from the ports.
- Loosely install the new high-pressure fuel supply line.
- Tighten the fuel injection supply manifold retaining bolts to 23 Nm (17 lb.ft).
- Tighten the fuel injection supply line unions in the sequence shown in four stages:
 - Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
 - Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 15 Nm (11 lb.ft).
 - Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).
 - Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 30 Nm (22 lb.ft).

8. Install the fuel injection pump supply line retaining bolt.

- Tighten to 10 Nm.

9. Connect the swirl plate actuator vacuum hose.

10. Connect the brake booster vacuum line to the brake vacuum pump.

11. Install the engine breather hose.

12. Install the engine wiring harness casing.

13. Install the engine wiring harness cover.

14. Attach the engine wiring harness.

E120332

15. Connect the right-hand KS electrical connector.

E112904

16. Attach the KS electrical connector to the valve cover.

E120331

17. Connect the MAP sensor and the fuel pressure sensor electrical connectors.

18. **NOTE:** Install a new gasket.

Attach the right hand timing cover.

- Tighten to 10 Nm.

19. Install the port deactivation solenoid and bracket assembly.

- Tighten the bolts to 10 Nm.

20. Attach the intake air shutoff throttle elbow.

- Secure with the clip.

21. Connect the air charge temperature sensor electrical connector.

22. Install the intake air shutoff throttle elbow retaining bolt.

23. Attach the coolant hose.

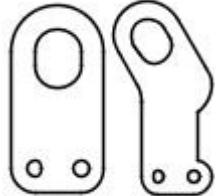

24. Install the secondary bulkhead center panel.
For additional information, refer to: [Secondary Bulkhead Center Panel](#) (501-02 Front End Body Panels, Removal and Installation).

25. Connect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Make sure to support the vehicle with axle stands.
Raise and support the vehicle.
3. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).
4. Recover the air conditioning (A/C) refrigerant.
5. Remove the cooling fan motor and shroud.
For additional information, refer to: [Cooling Fan Motor and Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).
6. Remove the transmission.
For additional information, refer to: [Transmission - TDV6 2.7L Diesel](#) (307-01 Automatic Transmission/Transaxle - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol/TDV6 2.7L Diesel, Removal).
7. Remove the injector sound proofing.
8. Remove the radiator top hose.

E50704

9. Disconnect the hose from the radiator.

10. Disconnect the brake booster vacuum pipe.

11. Disconnect the glow plug harness electrical connectors.

12. Remove the engine compartment brace.

13. Disconnect the air intake hose.

E51070

14. Detach the coolant expansion tank coolant hose from the intake air shutoff throttle elbow.

E63470

15. Remove the intake air shutoff throttle elbow retaining bolt.

E63471

16. Disconnect the intake air temperature (IAT) sensor electrical connector.

E65954

17. Remove the intake air shutoff throttle elbow.

- Remove and discard the O-ring seal.

E67390

18. Disconnect the exhaust gas recirculation (EGR) coolant hose.

19. Disconnect the coolant hose.

20. Disconnect the charge air cooler inlet hose.

21.  CAUTION: Be prepared to collect escaping coolant.

Disconnect the thermostat housing lower radiator hose.

- Release the retaining clip.

Left-hand drive vehicles

22. Release and reposition the wiring harness.

All vehicles

23. Release the diesel particulate filter (DPF) differential pressure sensor.

24. Remove the RH secondary bulkhead panel.

25. Remove the RH pedestrian protection actuator and bracket.

E98989

26. Remove the engine control module (ECM) cover.

E98990

27. Disconnect the ECM electrical connectors.

E 67398

28. Disconnect the engine wiring harness electrical connector.

E67442

29. Release the fuel line safety clip.

E94326

30.  CAUTION: Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Disconnect the high pressure fuel pump supply line from the fuel filter.

E94328

31.  CAUTION: Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Disconnect the high-pressure fuel pump return line from the fuel filter.

32.  CAUTION: Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Disconnect the fuel line.

33. Reposition the fuel filter and support bracket.

34. Release the accessory drive belt.

1. Using the special tool, rotate the accessory drive belt tensioner counter-clockwise.

35. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Release and reposition the power steering pump.

- Tie aside.

36. Disconnect the air conditioning (A/C) compressor supply and return lines.

- Remove and discard the O-ring seals.
- Install blanking caps to the exposed ports.

37. Disconnect the coolant hose.

38. Disconnect the 2 transmission fluid cooler hoses.

39. Raise the vehicle.

40. Detach the starter motor cable.

41. Release the battery positive cable protective cover.

42. Disconnect the battery positive cable from the generator.

43. Disconnect the engine earth strap.

44. NOTE: Right-hand shown, left-hand similar.

Remove the engine mounts lower retaining nuts.

45. Lower the vehicle.

46. Install the special tool.

47. Remove the special tool.

48. Install the lifting equipment to the vehicle.

- Install the lifting chains.

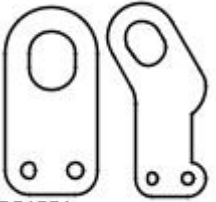

49. Remove the engine.

- With assistance, carefully remove the engine.

Engine - TDV6 2.7L Diesel - Engine

Installation

Installation

All vehicles

1. Install the engine.

- With assistance, carefully install the engine.

E31824

2. Remove the engine lifting equipment.

- Remove the lifting chains.

3. Install the special tool.

- Rotate the special tool adjustment bolt a suitable amount of turns to support the engine.

E51613

4. Remove the special tool.

5. Raise the vehicle.

6. NOTE: Right-hand shown, left-hand similar.

Install the engine mounts lower retaining nuts.

- Tighten to 63 Nm.

7. Connect the engine earth strap.

- Tighten to 25 Nm.

8. Connect the battery positive cable to the generator.

- Tighten to 15 Nm.

9. Attach the battery positive cable protective cover.

10. Attach the starter motor cable.

- Tighten to 10 Nm.

11. Lower the vehicle.

12. Connect the 2 coolant hoses to the transmission fluid cooler.

13. Connect the coolant hose.

14. Connect the A/C lines.

- Remove the blanking plugs.
- Install new O-ring seals.
- Tighten to 10 Nm.

15. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Attach the power steering pump.

- Tighten to 25 Nm.

16. Attach the accessory drive belt.

- Using the special tool, rotate the accessory drive belt tensioner counter-clockwise.

17. Install the fuel filter support bracket.

- Tighten to 25 Nm.

18. NOTE: Remove and discard the blanking caps.

Connect the fuel line.

19. NOTE: Remove and discard the blanking caps.

Connect the high-pressure fuel pump return line to the fuel filter.

E94329

20. NOTE: Remove and discard the blanking caps.

Connect the high pressure fuel pump supply line to the fuel filter.

E94328

21. Attach the fuel line safety clip.

E94326

22. Connect the engine wiring harness electrical connector.

- Tighten to 10 Nm.

E67442

23. Connect the ECM electrical connectors.

E 67398

24. Install the ECM cover.

- Tighten to 10 Nm.

E98990

25. Install the RH pedestrian protection actuator and bracket.

- Tighten to 25 Nm.

E98989

26. Install the RH secondary bulkhead panel.

E95320

27. Attach the DPF differential pressure sensor.

- Tighten to 2 Nm.

E95319

Left-hand drive vehicles

28. Attach the wiring harness.

All vehicles

29. Connect the thermostat housing to the radiator.

- Attach the retaining clip.

30. Connect the charge air cooler inlet hose.

- Tighten to 5 Nm.

31. Connect the coolant hose.

32. Connect the RH EGR coolant hose.

33. Install the intake air shutoff throttle elbow.

- Install a new O-ring seal.

34. Connect the intake air temperature (IAT) sensor electrical connector.

35. Install the intake air shutoff throttle elbow retaining bolt.

- Tighten to 10 Nm.

36. Attach the coolant expansion tank coolant hose to the intake air shutoff throttle elbow.

37. Connect the air intake hose.

- Tighten to 5 Nm.

E51070

38. Install the engine compartment brace.

- Tighten to 25 Nm.

E98676

39. Connect the glow plug harness electrical connectors.

E67444

40. Connect the brake booster vacuum pipe.

E98987

41. Connect the coolant hose to the radiator.

42. Connect the coolant top hose.

43. Install the injector sound proofing.

44. Install the transmission.

For additional information, refer to: [Transmission - TDV6 2.7L Diesel](#) (307-01 Automatic Transmission/Transaxle - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol/TDV6 2.7L Diesel, Removal).

45. Install the cooling fan motor and shroud.

For additional information, refer to: [Cooling Fan Motor and Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

46. Charge the A/C refrigerant.

47. Refill and bleed the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).

48. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

49. Check and top-up the engine oil.

Engine - V6 3.0L Petrol - Engine - Overview

Description and Operation

Overview

The 3.0 V6 engine is a liquid cooled 6 cylinder unit, arranged in 2 planes having a 60 degree 'V' configuration. It features a strong, forged steel crankshaft having 3 throws and 4 main bearings.

The lightweight aluminum cylinder block is equipped with steel dry liners and provides 4 main bearings. These are supported by an aluminum structural bedplate with cast iron inserts. This design increases the torsional stiffness of the crankcase/bed-plate assembly and minimizes vibration levels. A die-cast aluminum oil pan is bolted to the bed-plate and adds further stiffness.

The 4 cast iron camshafts, 2 per cylinder head, are chain-driven and operate a total of 24 valves (4 valves per cylinder). All valves are directly activated via mechanical bucket tappets and the inlet camshaft features continuously [VCT \(variable camshaft timing\)](#).

The continuously [VCT](#) adjusts the timing of the inlet camshafts. This ensures maximum performance throughout the speed range and for all engine demands. The system is controlled by the engine management system.

Engine - V6 3.0L Petrol - Engine - System Operation and Component Description

Description and Operation

System Operation

Operation of the engine is controlled by the [ECM \(engine control module\)](#).

Refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - V6 3.0L Petrol, Description and Operation).

Component Description

General

The engine includes the following features:

- 10.5 : 1 compression ratio.
- Lightweight valve gear.
- Unique camshaft lift and duration.

The engine has an aluminum cylinder block with dry steel liners. A forged steel, three-throw crankshaft is carried in four main bearings supported by an aluminum structural bedplate with cast iron inserts. This design increases the engine's torsional stiffness and minimizes vibration levels. Torsional stiffness is further increased by a die-cast aluminum oil pan bolted to the bedplate.

Four chain-driven cast iron camshafts, two per cylinder head, operate four valves per cylinder. All valves are directly activated via mechanical bucket tappets, and the intake camshafts feature [VCT \(variable camshaft timing\)](#). The [RH \(right-hand\)](#) cylinder bank (bank 1) contains the odd numbered cylinders, with cylinder No. 1 towards the front of the vehicle. The [LH \(left-hand\)](#) cylinder bank (bank 2) contains the even numbered cylinders, with cylinder No. 2 towards the front of the vehicle.

Variable Camshaft Timing

Oil is supplied to the front of each [VCT](#) actuator via the spider bracket assembly, which contains the [VCT](#) actuator solenoid, supply oil galleries and timing chain guide. Oil pressure advances and retards the camshaft timing which is controlled by the engine management system via a solenoid valve mounted on top of the oil feed spider assembly. Camshaft timing, dependant on engine speed, load and oil temperature can be optimised over the adjustment range of 30 degrees.

Engine Lubrication System

The engine lubrication system is of the force-feed type in which oil is supplied under pressure to the:

- Crankshaft main bearings.
- Crankshaft thrust main bearing.
- Connecting rod bearings.
- Valve shims.
- Camshaft bearings.
- [VCT](#).

All other parts are lubricated by splashed oil.

The oil is pressurized by a rotary pump installed at the front of the engine block and driven by the crankshaft.

A full flow oil filter is externally mounted on the oil filter housing. If the filter element should become blocked, a spring-loaded bypass valve will open and allow an uninterrupted flow of oil to the engine.

Engine - V6 3.0L Petrol - Engine

Diagnosis and Testing

For additional information.

Engine - V6 3.0L Petrol - Engine Oil Draining and Filling

General Procedures

Special Tool(s)

303-752

E75849

Wrench, Oil filter

303-752

 **WARNING:** The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

 **CAUTION:** Correct installation of the oil filler cap can be obtained by tightening the cap until an audible click is heard.

• **NOTE:** Clean the components general area prior to dismantling.

 **1. WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the air deflector.
For additional information, refer to: Air Deflector (501-02, Removal and Installation).

3. Remove the oil pan drain plug.

- Position a container to collect the fluid.
- Discard the oil pan drain plug seal.

4. Using the special tool, remove the oil filter.

- Position a container to collect the fluid.
- Discard the oil filter.

5. Using the special tool, install the oil filter.

6. Tighten the drain plug to 25 Nm.

- Install a new seal.

7. Fill the engine with oil.

8. Start engine and run at idle speed until the oil pressure warning light extinguishes.

- Stop the engine.
- Check for leaks.

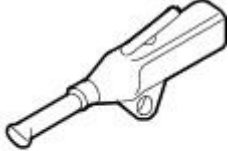

9. Install the air deflector.

For additional information, refer to: Air Deflector (501-02, Removal and Installation).

10. Check and top-up the engine oil.

Engine - V6 3.0L Petrol - Valve Clearance Adjustment

General Procedures

Special Tool(s)	
 DWST074	Fan nozzle - air gun 303-590
 E99146	Tappet hold-down tool 303-717

- Remove the LH valve cover.
For additional information, refer to: [Valve Cover LH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).
- Remove the RH valve cover.
For additional information, refer to: [Valve Cover RH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

3. CAUTIONS:

 Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

 Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

Rotate the engine clockwise to position the camshaft lobe away from the shim surface.

- Using the feeler gauge set, measure the clearance between the camshaft and the shim surface. Record and check the readings.
- Repeat the above procedure for the remaining valves.

- Remove the camshaft bearing cap.

- Install the special tool.

- Make sure the legs of the tool are in contact with the edge of the valve bucket, compress the bucket.

- Use the following formula to calculate the required shim thickness.
6.  WARNING: The following operations require the use of compressed air. ~~Original shim thickness~~ + measured clearance - desired clearance = required shim thickness.

 **CAUTION:** Do not use a magnet to remove shims. Failure to follow these instructions may result in damage to the vehicle.

 compressed air to remove the shims that require replacing. Shims must be fitted with the size markings facing the tappet, not the camshaft. Surround the immediate working area with a cloth, to retain any loose shims displaced by the compressed air.

 Do not use the special tool 303-590 aimed at the edge of the shim, to lift it from the tappet. Note the position of each one. Instructions may result in damage to the vehicle.

- Remove the old shim and measure the shim.

- Apply a light coat of clean engine oil to the replacement valve shims.

9. Remove the special tool.

10. Install the camshaft bearing caps in their original position.

- Lubricate the journals and camshaft lobes with clean engine oil.
- Install the cap.
- Install the camshaft bearing cap retaining bolts evenly.
- Tighten to 10 Nm.

11. If necessary, repeat the above adjustment procedure.

- Check the valve tappet clearances are correct.
- Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.
- Adjust the clearances as necessary.

12.  **WARNING:** The following operations require the use of compressed air. Always wear suitable eye protection.

• CAUTIONS:

 Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

 Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

 Do not use a magnet to remove shims. Failure to follow these instructions may result in damage to the vehicle.

Repeat the above procedure for the remaining valves.

13. Install the right-hand valve cover.

For additional information, refer to: [Valve Cover RH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

14. Install the left-hand valve cover.

For additional information, refer to: [Valve Cover LH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

Engine - V6 3.0L Petrol - Valve Clearance Check

General Procedures

1. Remove the LH valve cover.
For additional information, refer to: [Valve Cover LH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).
2. Remove the RH valve cover.
For additional information, refer to: [Valve Cover RH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

3. CAUTIONS:

 Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

 Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

Rotate the engine clockwise to position the camshaft lobe away from the shim surface.

- Using the feeler gauge set, measure the clearance between the camshaft and the shim surface. Record and check the readings.
- Repeat the above procedure for the remaining valves.

4. Adjust the clearances as necessary.
For additional information, refer to: [Valve Clearance Adjustment](#) (303-01B Engine - V6 3.0L Petrol, General Procedures).
5. Install the right-hand valve cover.
For additional information, refer to: [Valve Cover RH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).
6. Install the left-hand valve cover.
For additional information, refer to: [Valve Cover LH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

Engine - V6 3.0L Petrol - Camshafts LH

In-vehicle Repair

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
- Remove the timing drive components.
For additional information, refer to: [Timing Drive Components](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

-  **CAUTION:** Note the fitted position of the component prior to removal.

Remove the camshaft bearing caps evenly.

VUJ0003766

VUJ0003767

-  **CAUTION:** Note the fitted position of the component prior to removal.

Remove the camshafts.

Installation

-  **CAUTION:** Make sure that these components are installed to the noted removal position.

- NOTE:** Lubricate the camshafts and the camshaft bearing caps with oil meeting Jaguar specification prior to installation.

Install the camshafts.

VUJ0003767

VUJ0004303

2. CAUTIONS:

Do not install the cylinder head camshaft journal thrust caps until the camshaft journal caps are installed or damage to the thrust caps may occur.

Make sure that these components are installed to the noted removal position.

Install the camshaft bearing caps in their original position.

- Install the camshaft bearing cap retaining bolts evenly.
- Tighten the retaining bolts in the sequence shown to 10 Nm.

3. Carry out a valve clearance check.

For additional information, refer to: [Valve Clearance Check](#) (303-01B Engine - V6 3.0L Petrol, General Procedures).

4. Install the timing drive components.

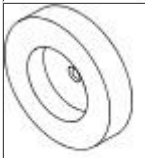

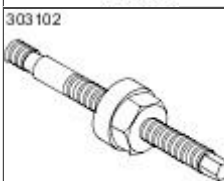

For additional information, refer to: [Timing Drive Components](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

5. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

14. Install the special tool.
15. NOTE: This step requires the aid of another technician.
Remove the crankshaft pulley retaining bolt.

16. Install the special tool.

VUJ0001015

E30900

17. Using the special tools, remove the crankshaft pulley.

Installation

All vehicles

1. Using the special tools, install the crankshaft pulley.

- Coat the crankshaft pulley keyway with silicone gasket sealant meeting Jaguar specification.

2. Install the special tool.

3. **NOTE:** This step requires the aid of another technician.

Install the crankshaft pulley bolt.

- Tighten to 120 Nm.
- Loosen the bolt (minimum 1 turn).
- Tighten to 50 Nm.
- Angle torque to 90 degrees.

4. Install the coolant hose.

5. Install the accessory drive pulley.
For additional information, refer to: [Accessory Drive Belt Idler Pulley](#)
(303-05B Accessory Drive - V6 3.0L Petrol, Removal and Installation).
6. Connect the radiator lower hose.

7. Connect the 2 coolant hoses.

8. Install the fuel line retaining bracket.

- Install the bolt and tighten to 10 Nm

9. Connect the ECT sensor electrical connector.

- Attach the retaining clip.

10. Connect the radiator upper hose.

11. Connect the coolant hoses.

E101416

12. Install the throttle body.

For additional information, refer to: [Throttle Body](#) (303-04C Fuel Charging and Controls - V6 3.0L Petrol, Removal and Installation).

Vehicles with secondary air injection (AIR)

13. Install the AIR control valve.

For additional information, refer to: [Secondary Air Injection \(AIR\) Control Valve](#) (303-08B Engine Emission Control - V6 3.0L Petrol, Removal and Installation).

All vehicles

14. Carry out the cooling system filling and bleeding procedure.

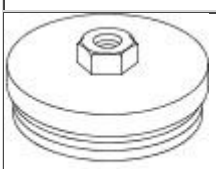

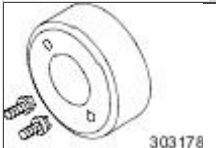

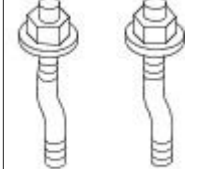

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03B Engine Cooling - V6 3.0L Petrol, General Procedures).

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
- Remove the flexplate.
For additional information, refer to: [Flexplate](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

-  **CAUTION:** Avoid scratching or damaging the oil seal sealing surfaces on the crankshaft and cylinder block.

Using the special tools, remove the crankshaft rear seal.

Installation

- Clean and inspect the crankshaft rear seal sealing surfaces.
- Lubricate the crankshaft flange, the crankshaft rear seal, and the seal lip.
 - Use engine assembly lubricant or equivalent meeting Jaguar specification ESR-M99C80-A.

3. NOTE: Alternate bolt tightening to correctly seat the crankshaft rear oil seal until it is flush with the cylinder block.

Using the special tools, install the crankshaft rear seal.

- Install the crankshaft rear oil seal between flush and 2.0 mm underflush with the engine block.

4. Install the flexplate.

For additional information, refer to: [Flexplate](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

5. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - V6 3.0L Petrol - Cylinder Head

In-vehicle Repair

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
- Remove the camshafts.
For additional information, refer to: [Camshafts LH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).
- Disconnect the fuel pressure regulator electrical connector and vacuum hose.

- Remove the fuel supply manifold and lower intake manifold.
 - Remove and discard the lower intake manifold gaskets.

- Remove the coolant crossover tube.
 - Discard the O-ring seals.

- Remove the catalytic converter.
For additional information, refer to: [Catalytic Converter](#) (309-00B Exhaust System - V6 3.0L Petrol, Removal and Installation).

8. NOTE: LH cylinder head only.

Remove the oil level indicator and tube.

- Remove the retaining bolt.
- Remove the oil level indicator and tube.

9. NOTE: LH cylinder head only.

Detach the engine harness earth strap from the rear of the left-hand cylinder head.

10. NOTE: Remove the retaining bolts in the indicated sequence.

Remove the cylinder head.

- Remove the retaining bolts in the indicated sequence.
- Remove and discard the cylinder head gasket.

11. NOTE: Make sure that all the component mating faces are clean.

Clean and inspect the cylinder head and cylinder block.

Installation

1. NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

Install a new cylinder head gasket.

2. ⚠ CAUTION: Use care when installing the cylinder head. Damage to the cylinder block, cylinder head or cylinder head gasket may result.

- NOTE: Make sure the cylinder head is installed in its original position.
- NOTE: Make sure the cylinder head is installed in its original position.
- NOTE: Tighten the retaining bolts in the indicated sequence in six stages.

Install the cylinder head and install new cylinder head retaining bolts and washers.

- Stage 1: Tighten to 30 Nm.
- Stage 2: Tighten the bolts a further 90 degrees.
- Stage 3: Loosen 360 degrees.
- Stage 4: Tighten to 30 Nm.
- Stage 5: Tighten the bolts a further 90 degrees.
- Stage 6: Tighten the bolts a further 90 degrees.

3. NOTE: LH cylinder head only.

Attach the engine harness earth strap to the rear of the left-hand cylinder head.

- Tighten to 10 Nm.

4. NOTE: LH cylinder head only.

Install the oil level indicator and tube.

- Install the retaining bolt.
- Tighten to 10 Nm.

5. Install the catalytic converter.

For additional information, refer to: [Catalytic Converter](#) (309-00B Exhaust System - V6 3.0L Petrol, Removal and Installation).

6. NOTE: Install new O-ring seals.

Install the coolant crossover tube.

- Tighten to 10 Nm.

7. NOTE: Install new lower intake manifold gaskets.

Install the fuel injection supply manifold and lower intake manifold.

- Install the fuel supply manifold and lower intake manifold gaskets.
- Tighten the bolts to the sequence shown.
- Tighten to 10 Nm.

- 8.** Connect the fuel pressure regulator electrical connector and vacuum hose.

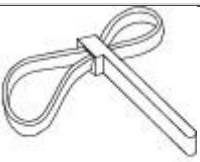

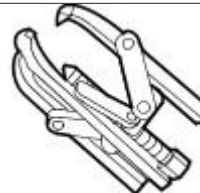

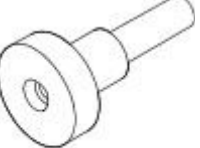

VUJ0001115

- 9.** Install the camshafts.
For additional information, refer to: [Camshafts LH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).
- 10.** Connect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

29. Lower the vehicle.

30. Disconnect the crankshaft position (CKP) sensor electrical connector.

E30914

31. NOTE: Right-hand camshaft position sensor shown, left-hand similar.

Disconnect the 2 camshaft position (CMP) sensor electrical connectors.

32. Remove the engine front cover.

33. Remove and discard the engine front cover gaskets.

Installation

1. Install new engine front cover gaskets.

2. Apply a 6 mm diameter dot of silicone sealant meeting Jaguar specification to the indicated locations.

VUJ0003672

3. NOTE: The engine front cover retaining bolts numbered 3,4,10 and 11 are longer than the retaining bolts numbered 1,2,5,6,7,8,9,12,13,15 and 16. The retaining bolt numbered 14 is a retaining bolt with a stud head.

Install the engine front cover.

- Tighten to 25 Nm.

E 30916

4. NOTE: Right-hand camshaft position sensor shown, left-hand similar.

Connect and secure the CMP sensor electrical connectors.

VUJ0003995

5. Connect the CKP sensor electrical connector.

E 30914

6. Raise the vehicle.

7. Attach the power steering pump.

- Tighten to 25 Nm.

VUJ0001803

8. Install the splash shield.

- Install the splash shield retaining clip.

9. Install the power steering pump upper retaining bolts.

- Tighten to 25 Nm.

10. Install the left-hand idler pulley.

- Tighten to 25 Nm.

11. Install the right-hand idler pulley.

- Tighten to 25 Nm.

12. Attach the engine splash shield.

- Attach the engine harness to the right-hand idler pulley.
- Attach the engine splash shield.
- Tighten to 25 Nm.

13. Lower the vehicle.

14. Install the accessory drive belt tensioner.

- Tighten to 45 Nm.

15. Attach the fuel supply manifold retaining bolt.

- Tighten to 10 Nm.

16. Install the coolant pump.

- Tighten to 25 Nm.

17. Install the coolant hose.

18. Attach the coolant hose.

19. Install the crankshaft front oil seal.

20. Using the special tools, install the crankshaft pulley.

- Coat the crankshaft pulley keyway with silicone gasket sealant meeting Jaguar specification.
- Coat the sealing surfaces of the crankshaft pulley with silicone gasket sealant meeting Jaguar specification.

21. Install the special tool.

22. Install the crankshaft pulley bolt.

- Tighten to 120 Nm.
- Loosen the bolt (minimum 1 turn).
- Tighten to 50 Nm.
- Tighten a further 90 degrees.

23. Install the coolant hose assembly.

24. Connect the coolant hose assembly to the coolant pump and lower hose.

25. Connect the coolant hose to the radiator upper hose assembly.

26. Connect the radiator upper hose.

27. Install the accessory drive belt.

For additional information, refer to: [Accessory Drive Belt](#) (303-05B Accessory Drive - V6 3.0L Petrol, Removal and Installation).

28. Install the oil pan.

For additional information, refer to: [Oil Pan](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

29. Install the LH valve cover.

For additional information, refer to: [Valve Cover LH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

30. Install the RH valve cover.

For additional information, refer to: [Valve Cover RH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

31. Refill and bleed the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03B Engine Cooling - V6 3.0L Petrol, General Procedures).

32. Fill the engine with the recommended oil to the correct level.

Engine - V6 3.0L Petrol - Engine Mount LH

In-vehicle Repair

Special Tool(s)

502-005

Subframe Alignment Bolt

502-005

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

4.  **CAUTION:** Discard the bolt.

Remove the steering gear shaft pinch bolt.

VUJ0005119

5. Detach the steering gear.
 - Remove the 3 bolts.

VUJ0005142

6. Secure the steering gear.

VUJ0005121

7. Remove the engine mount retaining nut.

- Support the engine.

VUJ0005532

8.  **WARNING:** Do not remove the front subframe retaining bolts. Failure to follow this procedure may result in personal injury.

Loosen the front subframe retaining bolts to enable the engine mount to be removed.

E30924

9. Remove the engine mount.

- Raise the engine.

E30923

Installation

1.  **CAUTION:** Make sure the engine mount locators are correctly aligned on installation. Failure to follow this procedure may result in damage to the vehicle.

- **NOTE:** Left-hand shown, right-hand similar.

Install the engine mount.

- Install a new nut and tighten to 48 Nm.

E30923

2. NOTE: Left-hand shown, right-hand similar.

Install the special tool.

3. NOTE: Left-hand shown, right-hand similar.

Install the front subframe rear retaining bolt.

- Tighten to 150 Nm + 240°.

4. Remove the special tool.

5. Install the front subframe front retaining bolt.

- Tighten to 150 Nm + 240°.

6. NOTE: Left-hand shown, right-hand similar.

Install the engine mounts retaining nut.

- Tighten to 63 Nm.

VUJ0005142

7. Attach the steering gear.

- Tighten to 100 Nm.

VUJ0005119

8.  CAUTION: Make sure that a new bolt is installed.

Install the steering gear shaft pinch bolt.

- Tighten to 35 Nm.

9. Install the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

10. Lower the vehicle.

11. Connect the battery ground cable.

For additional information, refer to: [Specifications](#) (414-01 Battery, Mounting and Cables, Specifications).

Engine - V6 3.0L Petrol - Exhaust Manifold LH

In-vehicle Repair

Removal

All vehicles

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

All vehicles

2. Remove the left-hand exhaust manifold heat shield.

E30942

Vehicles with secondary air injection (AIR)

3. Disconnect the secondary air injection (AIR) control valve to exhaust manifold left-hand tube.

E100421

All vehicles

4. NOTE: Engine shown removed for clarity.

- NOTE: When an exhaust manifold retaining stud is removed, it must be replaced with a new retaining stud and nut.

Remove the left-hand exhaust manifold upper retaining nuts.

E30943

5. Raise the vehicle.

Left-hand drive vehicles

6. Detach the steering column lower shaft and tie aside.

E99345

7. Disconnect the steering gear control valve actuator electrical connector.

E62469

8. Detach the steering gear.

VUJ0005142

9. Using suitable tie strap(s), secure the steering gear.

All vehicles

10. Remove the left-hand catalytic converter.
For additional information, refer to: [Catalytic Converter](#) (309-00B Exhaust System - V6 3.0L Petrol, Removal and Installation).

11. NOTE: Engine shown removed for clarity.

• NOTE: When an exhaust manifold retaining stud is removed, it must be replaced with a new retaining stud and nut.

Remove the left-hand exhaust manifold.

- Remove and discard the gasket.

Installation

All vehicles

1. NOTE: Engine shown removed for clarity.

• NOTE: Tighten the exhaust manifold retaining nuts in the sequence shown.

• NOTE: When a new exhaust manifold retaining stud is installed, tighten to 9 Nm.

To install, reverse the removal procedure.

- Install a new gasket.
- Tighten to 20 Nm.

Vehicles with secondary air injection (AIR)

2. Tighten to 35 Nm.

Left-hand drive vehicles

3. Tighten to 100 Nm.

4. Tighten to 35 Nm.

All vehicles

5. Tighten to 10 Nm.

E30942

Engine - V6 3.0L Petrol - Flexplate

In-vehicle Repair

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the automatic transmission.
For additional information, refer to: [Transmission - V6 3.0L Petrol](#) (307-01 Automatic Transmission/Transaxle - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol/TDV6 2.7L Diesel, Removal).

- NOTE:** Prevent the flexplate from rotating.

Remove the flexplate.

- Remove the 8 bolts.

E46527

Installation

-  **CAUTION:** Make sure that the locating pin on the crankshaft is aligned with the guide hole in the flexplate.

To install, reverse the removal procedure.

- Tighten the bolts in the sequence shown in two stages.
- Tighten to 15 Nm.
- Tighten to 80 Nm.

E53833

- Install the automatic transmission.
For additional information, refer to: [Transmission - V6 3.0L Petrol](#) (307-01 Automatic Transmission/Transaxle - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol/TDV6 2.7L Diesel, Removal).

Engine - V6 3.0L Petrol - Oil Cooler

In-vehicle Repair

Special Tool(s)	
 <p>303-752</p> <p>E75849</p>	<p>Wrench, Oil filter</p> <p>303-752</p>

Removal

1. Raise and support the vehicle.
2. Carry out the cooling system draining procedure.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03B Engine Cooling - V6 3.0L Petrol, General Procedures).
3. Remove the left-hand engine mount.
For additional information, refer to: [Engine Mount LH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).
4. Drain the engine oil.
 - Place a suitable container under the vehicle.
 - Remove the drain plug and drain the engine oil.
5. Remove and discard the engine oil filter.

6. Disconnect the coolant hoses.
7. Remove the oil filter housing.
 - Remove the center oil filter housing retaining bolt.
 - Remove the oil filter housing.

8. Remove the oil cooler.

- Remove and discard the oil cooler O-ring seal.

E30930

Installation

1. Install the oil cooler.

- Install a new oil cooler O-ring seal.
- Tighten to 58 Nm.

E30930

2. Install the oil filter housing.

- Loosely install the oil filter housing retaining bolts.
- Loosely install the center oil filter housing retaining bolt.
- Install the oil filter housing.

VUJ0001073

3. NOTE: Tighten the bolts in the indicated sequence.

Tighten all bolts to 25 Nm.

- Tighten the M22 bolt to 155 Nm.
- Tighten the rest to 40 Nm + 90 degrees.

VUJ0001841

4. Connect the coolant hoses.

5. Install a new engine oil filter.

6. Install the left-hand engine mount.

For additional information, refer to: [Engine Mount LH](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

7. Install the oil pan drain plug

- Tighten to 24 Nm.

8. Lower the vehicle.

9. Refill the engine with oil.

10. Carry out the coolant fill and bleeding procedure.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03B Engine Cooling - V6 3.0L Petrol, General Procedures).

Engine - V6 3.0L Petrol - Oil Pan

In-vehicle Repair

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
- Remove the cowl vent screen.
For additional information, refer to: [Cowl Vent Screen](#) (501-02 Front End Body Panels, Removal and Installation).
- NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Remove the engine compartment support.

- Detach the right-hand valve cover wiring harness.

- Disconnect the left-hand ignition coil-on plug electrical connectors.

7. Detach the left-hand valve cover wiring harness.

8. Remove the oil level indicator tube retaining bolt.

- Reposition the oil level indicator tube.

9. Remove the front subframe assembly.

For additional information, refer to: [Front Subframe - V6 3.0L Petrol](#) (502-00 Uni-Body, Subframe and Mounting System, Removal and Installation).

10. Remove the air conditioning (A/C) compressor.

For additional information, refer to: [Air Conditioning \(A/C\) Compressor - V6 3.0L Petrol](#) (412-03 Air Conditioning, Removal and Installation).

11. Detach the generator battery positive cable protective cover.

12. Disconnect the generator battery positive cable.

- Remove the battery positive cable retaining nut.

13. Disconnect the generator electrical connector.

14. Remove the generator.

15. Drain the engine oil.

16. Detach the power steering hose.

17. Detach the automatic transmission oil cooler tubes retaining bracket.

18. Lower the vehicle.

19. Using the special tools, raise the engine to a suitable height.

20. Raise the vehicle.

21. Remove the oil pan rear retaining bolts.

22. Remove the oil pan.

- Remove and discard the oil pan gasket.
- Clean and inspect the oil pan and cylinder block sealing surfaces using metal surface cleaner or equivalent meeting Jaguar specification.

Installation

1.  **CAUTION:** Install the oil pan within five minutes of applying the sealer. Failure to follow this instruction may cause damage to the vehicle.

• **NOTE:** Apply a 10 mm dot of silicone gasket and sealant meeting Jaguar specification to the engine block and front cover mating surface.

Install the oil pan retaining bolts.

1. Install a new gasket.
2. Install the retaining bolts finger tight.

2. Install and tighten the bolts.

- Tighten to 10 Nm.

3. Tighten the oil pan retaining bolts.

- Tighten the 4 bolts to 10 Nm.

4. Tighten the oil pan retaining bolts.

- Complete the tightening sequence as illustrated.
- Tighten to 25 Nm.

5. Tighten the oil pan to transmission housing retaining bolts.

- Tighten to 48 Nm.

6. Install the front subframe.
 For additional information, refer to: [Front Subframe - V6 3.0L Petrol \(502-00 Uni-Body, Subframe and Mounting System, Removal and Installation\)](#).

7. Lower the vehicle.

8.  CAUTION: Make sure the engine mounts locate into the correct position when the engine is repositioned.

Using the special tools, reposition the engine.

9.  WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise the vehicle.

10. Attach the automatic transmission oil cooler tubes retaining bracket.

- Tighten to 10 Nm.

11. Attach the power steering hose.

- Tighten to 10 Nm.

12. NOTE: Install a new sealing washer.

Install the oil pan drain plug.

- Tighten to 24 Nm.

13. Install the generator.

- Tighten to 48 Nm.

14. Connect the generator electrical connector.

15. Install the battery positive cable retaining nut.

- Tighten to 12 Nm.

16. Attach the generator battery positive cable protective cover.

17. Install the air conditioning (AC) compressor.

For additional information, refer to: [Air Conditioning \(A/C\) Compressor - V6 3.0L Petrol](#) (412-03 Air Conditioning, Removal and Installation).

18. Install the oil level indicator and tube.

- Tighten to 10 Nm.

19. Attach the left-hand valve cover wiring harness.

20. Connect the left-hand ignition coils electrical connectors.

21. Attach the right-hand valve cover wiring harness.

22. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Install the engine compartment support.

- Tighten to 25 Nm.

23. Install the cowl vent screen.

For additional information, refer to: [Cowl Vent Screen](#) (501-02 Front End Body Panels, Removal and Installation).

24. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

25. Refill the engine with oil.

Engine - V6 3.0L Petrol - Oil Pump

In-vehicle Repair

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
- Remove the timing drive components.
For additional information, refer to: [Timing Drive Components](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).
- Remove the oil pump tube.

E101237

- Remove the 2 retaining bolts.
- Remove and discard the O-ring seal.

- Remove the oil pump.

- Remove the 4 bolts.
- Remove and discard the O-ring seal.

E101238

Installation

1. CAUTIONS:

Install the oil pump flush to the cylinder block for correct sealing.

Rotate the inner rotor of the oil pump to align with the flats on the crankshaft before installation.

Install the oil pump.

- Install a new O-ring seal.
- Complete the tightening sequence.
- Tighten to 10 Nm.

2. Install the oil pump tube.

- Install a new O-ring seal.
- Tighten to 10 Nm.

E101414

E101237

3. Install the timing drive components.

For additional information, refer to: [Timing Drive Components](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

Engine - V6 3.0L Petrol - Timing Drive Components

In-vehicle Repair

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
- Remove the engine front cover.
For additional information, refer to: [Engine Front Cover](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).
- Remove the spark plugs.

- NOTE:** Note the position of the crankshaft position (CKP) sensor pulse wheel during removal. It must be returned to its original position during installation.

Remove the crankshaft position (CKP) sensor pulse wheel.

-  **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Install the crankshaft pulley retaining bolt and washer.

-  **CAUTION:** Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Rotate the crankshaft clockwise until the crankshaft keyway is at the 7 O'clock position, the alignment mark on the right-hand intake camshaft sprocket is at the 1 O'clock position and the alignment mark on the right-hand exhaust camshaft sprocket is at the 8 O'clock position.

8. Release the timing chain tensioner ratchet.

9. NOTE: Keep the timing chain tensioner ratchet released.
Reposition the timing chain tensioner plunger.

10. Retain the timing chain tensioner plunger.

11. Remove the right-hand timing chain tensioner.

12. Remove the right-hand timing chain outer guide.

13. Remove the right-hand timing chain.

VUJ0003362

14.  CAUTION: Inspect and replace the O-ring if necessary.

Remove the right-hand timing chain inner guide.

VUJ0003361

15.  CAUTION: Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Rotate the crankshaft clockwise until the crankshaft keyway is at the 11 O'clock position, the alignment mark on the left-hand intake camshaft sprocket is at the 9 O'clock position and the alignment mark on the left-hand exhaust camshaft sprocket is at the 2 O'clock position.

E31326

16. NOTE: Right-hand bank shown, left-hand bank similar.

Release the timing chain tensioner ratchet.

E48403

17. NOTE: Keep the timing chain tensioner ratchet released.

• NOTE: Right-hand bank shown, left-hand bank similar.

Reposition the timing chain tensioner plunger.

E48404

18. NOTE: Right-hand bank shown, left-hand bank similar.

Retain the timing chain tensioner plunger.

E48405

19. Remove the left-hand timing chain tensioner.

VUJ0003358

20. Remove the left-hand timing chain inner guide.

VUJ0003357

21. Remove the left-hand timing chain.

VUJ0003356

22.  CAUTION: Inspect and replace the O-ring if necessary.

Remove the left-hand timing chain outer guide.

VUJ0003355

23.  CAUTION: Make sure the crankshaft keyway is at the 9 O'clock position before any further engine repairs are carried out.

Remove the crankshaft pulley retaining bolt and washer.

24. Remove the crankshaft sprocket.

Installation

1. NOTE: Make sure the crankshaft sprocket timing marks are facing outwards.

Install the crankshaft sprocket.

2.  CAUTION: Make sure the crankshaft keyway is at the 9 O'clock position before the camshaft positions are aligned.

Install the crankshaft pulley retaining bolt and washer.

3. Rotate the left-hand intake camshaft clockwise until the camshaft sprocket alignment mark is at the 9 O'clock position and rotate the left-hand exhaust camshaft sprocket clockwise until the camshaft sprocket alignment mark is at the 2 O'clock position.

4. Rotate the right-hand intake camshaft clockwise until the camshaft sprocket alignment mark is at the 5 O'clock position and rotate the right-hand exhaust camshaft clockwise until the camshaft sprocket alignment mark is at the 12 O'clock position.

VUJ0004271

5. Rotate the crankshaft clockwise until the keyway is at the 11 O'clock position.

6.  **CAUTION:** Inspect and replace the O-ring if necessary.

Install the left-hand timing chain outer guide.

- Tighten the retaining bolts in the sequence shown.
- Stage 1: Tighten bolt 1 to 25 Nm.
- Stage 2: Tighten bolts 2 to 25 Nm.

VUJ0003807

7. CAUTIONS:

 Make sure the crankshaft keyway is at the 11 O'clock position, the alignment mark on the left-hand intake camshaft sprocket is at the 9 O'clock position and the alignment mark on the left-hand exhaust camshaft sprocket is at the 2 O'clock position.

 Make sure the timing chain alignment marks are correctly positioned to the crankshaft sprocket and camshaft sprocket alignment marks.

 Make sure the timing chain slack is on the tensioned side of the timing chain.

Install the left-hand timing chain.

VUJ0003356

8. Install the left-hand timing chain inner guide.

VUJ0003357

VUJ0003358

9.  CAUTION: Do not manually adjust the timing chain tensioner.

Install the left-hand timing chain tensioner.

- Tighten to 25 Nm.

VUJ0003808

10.  CAUTION: Do not manually adjust the timing chain tensioner.

Make sure the left-hand timing chain alignment marks have remained correctly positioned to the camshaft sprocket and crankshaft sprocket alignment marks.

E48405

11.  CAUTION: Do not manually adjust the timing chain tensioner.

Remove the timing chain tensioner retaining pin.

VUJ0003142

12.  CAUTION: Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Rotate the crankshaft clockwise until the crankshaft keyway is at the 3 O'clock position.

VUJ0003991

13.  CAUTION: Inspect and replace the O-ring if necessary.

Install the right-hand timing chain inner guide.

- Tighten the retaining bolts in the sequence shown.
- Stage 1: Tighten bolt 1 to 25 Nm.
- Stage 2: Tighten bolts 2 to 25 Nm.

14. CAUTIONS:

-  Make sure the crankshaft keyway is at the 3 O'clock position, the alignment mark on the right-hand intake camshaft sprocket is at the 5 O'clock position and the alignment mark on the right-hand exhaust camshaft sprocket is at the 12 O'clock position.
-  Make sure the timing chain alignment marks are correctly positioned to the crankshaft sprocket and camshaft sprocket alignment marks.
-  Make sure the timing chain slack is on the tensioned side of the timing chain.

Install the right-hand timing chain.

15. Install the right-hand timing chain outer guide.

16.  CAUTION: Do not manually adjust the timing chain tensioner.

Install the right-hand timing chain tensioner.

- Tighten to 25 Nm.

17.  CAUTION: Do not manually adjust the timing chain tensioner.

Remove the timing chain tensioner retaining pin.

18. CAUTIONS:

-  Make sure the right-hand timing chain alignment marks have remained correctly positioned to the camshaft sprocket and crankshaft sprocket alignment marks.

-  Do not manually adjust the timing chain tensioner.

Make sure all the timing chain alignment marks are in the positions shown.

19.  CAUTION: Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

• NOTE: Rotate the crankshaft using hand tools only.

Rotate the crankshaft two complete turns clockwise to make sure the valves and pistons do not clash.

20.  CAUTION: Do not rotate the crankshaft counterclockwise. The timing chains may bind causing engine damage.

Remove the crankshaft pulley retaining bolt and washer.

21. CAUTIONS:

 Make sure the crankshaft position (CKP) sensor wheel is correctly installed with the missing tooth aligned to the crankshaft keyway.

 Make sure the crankshaft position (CKP) sensor wheel is correctly installed with the teeth pointing outwards.

Install the crankshaft position (CKP) sensor pulse wheel.

22. Install the spark plugs.

- Tighten to 15 Nm.

23. Install the engine front cover.

For additional information, refer to: [Engine Front Cover](#) (303-01B Engine - V6 3.0L Petrol, In-vehicle Repair).

24. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - V6 3.0L Petrol - Valve Cover LH

In-vehicle Repair

Removal

1. Remove the left-hand on-plug coils.
For additional information, refer to: [Ignition Coil-On-Plug LH](#) (303-07A Engine Ignition - V6 3.0L Petrol, Removal and Installation).
2. Detach the left-hand valve cover wiring harness.

3. Detach the engine breather tube.

4. Detach the engine wiring harness retaining bracket.

5. Remove the valve cover.

Installation

1. NOTE: Apply a 5mm diameter bead of silicone gasket sealant or equivalent meeting Jaguar specification on the half round gaskets and apply an 8mm diameter on the two places where the cylinder head and front cover join.

To install, reverse the removal procedure.

- Install new valve cover gaskets.
- Complete the tightening sequence.
- Tighten to 10 Nm.

Engine - V6 3.0L Petrol - Valve Cover RH

In-vehicle Repair

Removal

1. Remove the right-hand on-plug coils.
For additional information, refer to: [Ignition Coil-On-Plug RH](#) (303-07A Engine Ignition - V6 3.0L Petrol, Removal and Installation).
2. Detach the right-hand valve cover wiring harness.

3. Detach the intake manifold rear retaining bracket.

4. Detach the engine wiring harness retaining bracket.

5. Remove the valve cover.

Installation

1. NOTE: Apply a 5mm diameter bead of silicone gasket sealant or equivalent meeting Jaguar specification on the half round gaskets and apply an 8mm diameter on the two places where the cylinder head and front cover join.

To install, reverse the removal procedure.

- Install new valve cover gaskets.
- Complete the tightening sequence.
- Tighten to 10 Nm.

E31295

Engine - V6 3.0L Petrol - Intake Manifold

Removal and Installation

Removal

1. Remove the air cleaner outlet pipe.

Refer to: [Air Cleaner Outlet Pipe](#) (303-12B Intake Air Distribution and Filtering - V6 3.0L Petrol, Removal and Installation).

2. **2. WARNINGS:**

 Never remove the coolant pressure cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

 To avoid having scalding hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

- 3.

4. **4. NOTE:** Clamp the coolant hose to minimize coolant lose.

5. **5.** NOTE: Remove and discard the O-ring seal.

For additional information, refer to: [Transmission - V6 3.0L Petrol](#) (307-01 Automatic Transmission/Transaxle - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol/TDV6 2.7L Diesel, Removal).
3. Remove the cooling module.
For additional information, refer to: [Cooling Module](#) (303-03B Engine Cooling - V6 3.0L Petrol, Removal and Installation).
4. Remove the front RH fender splash shield.
For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).
5. Lower the vehicle.
6. Evacuate the A/C system.

7.  **WARNING:** Make sure that the hood is sufficiently supported before the gas strut is disconnected.

- **NOTE:** Right-hand shown, left-hand similar.

With assistance, remove the hood.

- Release the hood support struts and secure the hood in an upright position.
- Remove the 2 nuts.

E100919

8. Depressurise the fuel system.
For additional information, refer to: [Fuel System Pressure Release - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol](#) (310-00 Fuel System - General Information, General Procedures).
9. Remove the RH secondary bulkhead panel.

10. Release the engine junction box (EJB).

11. **NOTE:** The engine control module (ECM) electrical connector retaining bolt remains captive in the electrical connector.

Disconnect the 2 electrical connectors.

- Disconnect the ECM electrical connector.
- Disconnect the engine junction box (EJB).
- Detach the engine harness grommet from the RH secondary bulkhead.
- Cut the cable tie.

12.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

Release the clip and disconnect the purge inlet line.

13. Disconnect the fuel supply manifold spring lock coupling.

14. Disconnect the coolant pipes.

15. Release the power steering fluid reservoir.

16. NOTE: The brake booster vacuum hose is attached to the induction manifold by a quick release coupling.

Detach the brake booster vacuum hose from the intake manifold.

17. Disconnect the secondary air injection (AIR) control valve supply hose.

E63560

18. CAUTIONS:

 Cap the power steering line to prevent losses of fluid and dirt ingress.

 If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

• NOTE: Drain the fluid into a suitable container.

Disconnect the power steering reservoir to power steering pump supply line.

E30125

19. CAUTIONS:

 Cap the power steering line to prevent losses of fluid and dirt ingress.

 If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

• NOTE: Drain the fluid into a suitable container.

Disconnect the power steering pump to steering gear supply line.

- Remove and discard the O-ring seal.

E30126

20. NOTE: Left-hand shown, right-hand similar.

Loosen the exhaust manifold retaining nut.

E30751

21. Install the special tool to the exhaust manifold.

- Install the retaining bolt.

E30752

22. NOTE: Left-hand shown, right-hand similar.

Install the retaining bolt.

Right-hand drive vehicles

23. Replace the fuse box.

24. Install the special tool support bars to the special tool.

25. Install the special tool.

26. Raise the vehicle.

27. Detach the battery positive cable protective cover.

E30757

28. Remove the battery positive cable retaining nut.

E30758

29. Disconnect the air conditioning (A/C) compressor supply and return lines.

- Remove and discard the O-ring seals.
- Install blanking caps to the exposed ports.

E97758

30. Reposition the A/C compressor supply and return lines away from the engine.

31. Detach the power steering hose.

32. Reposition the power steering hose away from the engine.

33. NOTE: Left-hand shown, right-hand similar.

Remove the engine mounts lower retaining bolts.

34. Detach the transmission fluid cooler tubes retaining bracket.

35. Reposition the transmission fluid cooler tubes away from the engine.

36. Detach the transmission wiring harness.

37. Lower the vehicle.

38. Remove the special tool.

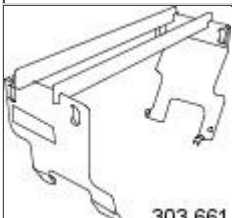

39. Remove the engine assembly.

- Using the special tools, install a suitable floor crane.

Engine - V6 3.0L Petrol - Engine

Installation

Special Tool(s)	
	Engine Lifting Bracket 303-661
	Engine support bracket 303-021

Installation

1. NOTE: Make sure all wiring harnesses and oil pipes are suitably positioned for engine installation.

Install the engine assembly.

- Make sure the engine mounts are correctly located.
- Remove the floor crane.

2. Install the special tool.

3. Raise the vehicle.

4. NOTE: Left-hand engine mount lower retaining bolt shown, right-hand similar.

Install the engine mounts lower retaining bolts.

- Tighten to 63 Nm.

5. Attach the transmission wiring harness

6. Attach the transmission fluid cooler tubes retaining bracket.

- Tighten to 10 Nm.

7. Attach the power steering hose.

- Tighten to 10 Nm.

8. Install the battery positive cable retaining nut.

- Tighten to 12 Nm.

9. Attach the battery positive cable protective cover.

10. Lower the vehicle.

11. Remove the special tool.

12. Remove the special tool.

13. NOTE: Left-hand shown, right-hand similar.

Install the exhaust manifold retaining nut.

- Tighten to 25 Nm.

14. NOTE: Un-cap the exposed ports.

Install new A/C compressor O-ring seals.

- Lubricate the new O-rings with A/C refrigerant oil.

15. Connect the A/C compressor supply and return lines.

E97758

16. NOTE: Un-cap the power steering pump exposed ports.

Install new power steering pump supply line O-ring seal.

17.  CAUTION: If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

Connect the power steering pump to the steering gear supply line.

E30126

18.  CAUTION: If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

Connect the power steering reservoir to the power steering pump supply line.

E30125

19. Attach the brake booster vacuum hose to the intake manifold.

E30103

20. Connect the secondary air injection (AIR) control valve supply hose.

E63560

21. NOTE: Install new O-ring seals.

Connect the fuel supply manifold spring lock coupling.

E30748

22. Connect the purge inlet line.

E61517

23. Secure the power steering fluid reservoir.

E97798

24. Connect the 2 hoses to the coolant pipes.

E100922

25. Connect the 2 electrical connectors.

- Connect the ECM electrical connector.
- Connect the EJB electrical connector.
- Attach the engine harness grommet to the RH secondary bulkhead.
- Secure the harness with a new cable tie.

E100920

26. Install the RH fender splash shield.

For additional information, refer to: [Fender Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

27. Install the cooling module.

For additional information, refer to: [Cooling Module](#) (303-03B Engine

Cooling - V6 3.0L Petrol, Removal and Installation).

28. Install the transmission.

For additional information, refer to: [Transmission - V6 3.0L Petrol](#) (307-01 Automatic Transmission/Transaxle - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol/TDV6 2.7L Diesel, Removal).

29. Install the secondary bulkhead RH panel.

For additional information, refer to: [Secondary Bulkhead Panel RH - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol/TDV6 2.7L Diesel](#) (501-02 Front End Body Panels, Removal and Installation).

30. Recharge the A/C system.

For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

31. Secure the EJB.

32. Install the hood.

- Tighten to 25 Nm

Engine - 4.2L NA V8 - AJV8 - Engine - Component Location

Description and Operation

External View

E93307

Engine - 4.2L NA V8 - AJV8 - Engine - Overview

Description and Operation

Overview

The liquid cooled V8 engine is a 4.2 liter unit, arranged in a 90 degree 'V' configuration, with a 4-throw crankshaft supported by 5 main bearings.

The lightweight cylinder block is of cast aluminum alloy construction with cast iron liners.

The cylinder heads, which are also manufactured in cast aluminum alloy, are unique for each cylinder bank. Deep seated bolts reduce distortion and secure the cylinder heads to the cylinder block. Each cylinder head incorporates 2 overhead camshafts, operating 4 valves per cylinder via valve lifters. A [VVT \(variable valve timing\)](#) system gives improved low and high-speed engine performance and excellent idle quality. The lightweight valve gear provides good economy and noise levels and is chain driven, via the crankshaft, for durability.

The aluminum alloy bedplate is a casting bolted to the bottom of the cylinder block to retain the crankshaft and improve lower structure rigidity. The oil pan assembly consists of a pressed steel oil pan bolted to a structural aluminum alloy casting, which is then bolted to the bedplate.

Engine - 4.2L NA V8 - AJV8 - Engine - System Operation and Component Description

Description and Operation

System Operation

General

Operation of the engine is controlled by the [ECM \(engine control module\)](#).

Refer to: Electronic Engine Controls (303-14 Electronic Engine Controls - 2.7L Diesel, Description and Operation).

Variable Valve Timing

When directed by the [ECM](#), the [VVT \(variable valve timing\)](#) unit will be set to the optimum position between full advance and retard for a particular engine speed and load. This is achieved when the [ECM](#) sends the energizing signal to the oil control solenoid until the target position is met. At this point, the energizing signal is reduced to hold the solenoid position, and as a result the position of the shuttle valve. This function is under closed-loop control, where the [ECM](#) will alter the energizing signal, when required, to maintain the desired position.

Engine oil properties and temperature can affect the ability of the [VVT](#) mechanism to follow demand changes to the cam phase angle. At very low oil-temperatures, movement of the [VVT](#) mechanism is sluggish due to increased viscosity, and at high oil-temperatures the reduced viscosity may impair operation if the oil pressure is too low. To maintain satisfactory [VVT](#) performance, an increased capacity oil pump is installed, plus an engine oil temperature sensor to enable monitoring by the [ECM](#). The [VVT](#) system is normally under closed-loop control except in extreme temperature conditions, such as cold starts below 0 °C (32 °F). At extremely high oil-temperatures, the [ECM](#) may limit the amount of [VVT](#) advance to prevent the engine from stalling when returning to idle speed.

The [VVT](#) does not operate when engine oil-pressure is below 1.25 bar (18.1 lbf/in²), as there is insufficient pressure to release the [VVT](#) unit's internal stopper pin. This usually occurs when the engine is shutting-down and the [VVT](#) has returned to the retarded position. The stopper pin locks the camshaft to the [VVT](#) unit to ensure camshaft stability during the next engine start-up.

Component Description

Engine Structure

E71998

ItemDescription

1	Cylinder head (2 off)
2	Cylinder block
3	Bedplate
4	Structural sump

Cylinder Block Components

The cylinder block is of a cast aluminum alloy construction with cast iron liners. The 90 degree 'V' configuration provides a rigid structure with good vibration levels. A low volume coolant jacket improves warm-up times and piston noise levels; the longitudinal flow design of the jacket, with a single cylinder head coolant transfer port in each bank, improves rigidity and head gasket sealing. The **RH (right-hand)** cylinder bank is designated as bank 1, and the **LH (left-hand)** as bank 2, viewed from the front of the engine.

Data Locations

E43426

ItemDescription

1 Engine part number

2 Engine data (main bearing diameters, cylinder bore diameters, etc), emissions code and engine number

Engine data is marked at 3 locations, 2 on the cylinder block (shown) and 1 on the engine front cover, which consists of a label displaying the engine number. Component diameters are represented by alpha and numeric codes.

Refer to: [Crankshaft Main Bearing Journal Clearance - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (303-00 Engine System - General Information, General Procedures).

Piston and Connecting Rod Assembly

E43427

The connecting rods are manufactured from sinter-forged steel and have fracture-split bearing caps. The bearing caps are produced by fracturing the opposing sides of the connecting rod at the bearing horizontal centre line. As well as being easier to manufacture, when reassembled the fractured surfaces interlock to form a strong seamless joint. The cylinder position is marked on adjoining sides of the joint to identify matching connecting rods and bearing caps. The connecting rod bearings are aluminum/tin split plain bearings.

The pistons are of the open-ended skirt design with a dished crown. Three piston rings, 2 compression and one 3-piece oil control ring, are installed on each piston. Each piston is installed on a gudgeon pin located in a bronze bushing in the connecting rod.

Connecting Rod Orientation

E43428

ItemDescription

1	Bank 1
2	Bank 2
3	Piston

The piston grade number is stamped on the crown of the piston and must coincide with that for each cylinder bore. The piston must be assembled in the correct orientation for the designated cylinder bore:

- Bank 1 - piston grade number and the thick flange of the connecting rod must face the front of the engine.
- Bank 2 - piston grade number and the thin flange of the connecting rod must face the front of the engine.

Crankshaft and Structural Sump Components

E43435

ItemDescription

1 Bedplate

2 Main bearings - lower (5 off)

Crankshaft and Main Bearings

E43436

ItemDescription

1	Crankshaft
2	Thrust washer
3	Thrust washer
4	Main bearings - upper (5 off)

Six counter-balance weights ensure good vibration levels from the 4 throw, 5 bearing crankshaft. Manufactured in cast iron, the crankshaft also has undercut and rolled fillets for improved strength.

The crankshaft rear oil seal is a press fit in the bedplate to cylinder block interface.

The main bearings are aluminum/tin split plain bearings. An oil groove in the upper half of each bearing transfers the oil into the crankshaft for lubrication of the connecting rod bearings. An aluminum/tin thrust washer is installed each side of the top half of the center main bearing.

Bedplate

E43437

The bedplate is a structural casting bolted to the bottom of the cylinder block to retain the crankshaft. The use of a bedplate further improves rigidity. Iron inserts, cast into the main bearing supports of the bedplate, minimize main bearing clearance changes due to heat expansion.

Two hollow dowels align the bedplate with the cylinder block.

Beads of sealant seal the joint between the bedplate and the cylinder block.

Oil Pan

E94455

ItemDescription

1	Oil pan
2	Structural sump

The aluminum alloy structural sump is bolted to the bedplate. A windage tray attached to the underside of the bedplate isolates the oil pan from the disturbed air produced by the rotation of the crankshaft, to prevent oil aeration and improve oil drainage. A rubber plug at the rear of the structural sump seals the port that provides access to the torque converter securing bolts. The engine oil drain plug is located in the pressed steel oil pan, which attaches to the underside of the aluminum alloy structural sump.

A bead of sealant seals the joint between the structural sump and the bedplate.

Oil Pump

E43439

The oil pump is installed on the crankshaft at the front of the engine. The pump outlet port aligns with oil passages in the bedplate (see Lubrication System for more information).

Starter Drive Plate

E43440

ItemDescription

- | | |
|---|---------------------|
| 1 | Starter drive plate |
| 2 | Bolts (8 off) |

The starter drive plate is attached to the rear of the crankshaft. A timing disc, for the [CKP \(crankshaft position\)](#) sensor, is spot welded to the front face of the drive plate.

Camshaft Timing Components

E43442

ItemDescription

1	Secondary chain tensioner
2	Secondary chain
3	VVT unit
4	Primary chain
5	Primary chain tensioner

Multiple link primary and single row secondary chains drive the camshafts of each cylinder bank. The primary chains transmit the drive from 2 sprockets on the crankshaft to variable valve timing units on the intake camshafts. The secondary chains transmit the drive from the variable valve-timing units to sprockets on the exhaust camshafts.

A key locates the 2 drive sprockets on the crankshaft. The crankshaft's torsional vibration damper retains the sprockets in

position. The variable valve timing units and the exhaust camshaft sprockets are non-interference, non-keyed fits on their respective camshafts; the drive being transmitted by the face to face friction load produced by the valve timing unit/sprocket securing bolt.

Each chain has a hydraulic tensioner operated by engine oil. The primary chains are lubricated via oil squirt tubes located at the front of the engine block near the crankshaft drive sprockets. A jet of oil from the end of each secondary chain tensioner lubricates the secondary chains. The primary chain tensioners act on pivoting flexible tensioner blades. The secondary chain tensioners act directly on the chains. Guide rails are installed on the drive side of the primary chains.

Variable Valve Timing

E31298

ItemDescription

1	VVT oil control unit
2	VVT oil control solenoid
3	Bush carrier

The [VVT](#) unit is a hydraulic actuator mounted on the end of the intake camshaft, which advances or retards the intake camshaft timing and thereby alters the camshaft to crankshaft phasing. The oil control solenoid, controlled by the [ECM](#), routes oil pressure to either the advance or retard chambers located either side of the 3 vanes interspersed within the machined housing of the unit.

The [VVT](#) unit is driven by the primary chain and rotates relative to the exhaust camshaft sprocket. When the [ECM](#) requests the camshaft timing to advance, the oil control solenoid is energized moving the shuttle valve to the relevant position to allow engine oil pressure, via a filter, into the [VVT](#) unit's advance chambers. When the camshaft timing is requested to retard, the shuttle valve moves position to allow oil pressure to exit the advance chambers, while simultaneously routing the oil pressure into the retard chambers.

Timing Cover

E43443

The aluminum alloy timing cover accommodates the crankshaft front oil seal (a [PTFE \(polytetrafluoroethylene\)](#) lip seal). Silicon rubber in-groove gaskets seal the joint between the timing cover and the front face of the engine.

Cylinder Head Components

E43444

ItemDescription

1	Camshaft bearing cap
2	Tappet
3	Collet
4	Valve spring cap
5	Valve spring
6	Valve stem oil seal
7	Valve
8	intake camshaft

9 Exhaust camshaft

The cylinder heads are unique to each cylinder bank. Deep-seated bolts, to reduce distortion, secure the cylinder heads to the cylinder block. Two hollow dowels align each cylinder head with the cylinder block. The multi-layered steel cylinder head gasket has cylinder specific coolant flow cross-sections for uniform coolant flow.

The 14 mm (0.55 in) spark plugs, 1 per cylinder, locate in recesses down the centre line of each cylinder head.

The engine-lifting eyes are bolted to the cylinder heads, 2 on the rear (1 per head) and 1 at the front.

Each cylinder head incorporates dual overhead camshafts operating 4 valves per cylinder via solid shim-less valve lifters.

The lightweight valve gear provides good fuel economy and noise levels. Valve head diameters are 31 mm (1.220 in) for the exhaust and 35 mm (1.378 in) for the intake. All valves have 5 mm (0.197 in) diameter stems supported in sintered metal seats and guide inserts. Collets, valve collars and spring seats locate single valve springs on both intake and exhaust valves. Valve stem seals are integrated into the spring seats.

Camshafts

E43446

The camshafts are manufactured in chilled cast iron. Five aluminum alloy caps retain each camshaft. Location numbers, 0 to 4 for the intake camshaft and 5 to 9 for the exhaust camshaft, are marked on the outer faces of the caps.

Sensor Timing Ring

E43447

ItemDescription

- | | |
|---|-----------------|
| 1 | Intake camshaft |
| 2 | Timing ring |

A camshaft position sensor timing ring is located at the rear of both intake camshafts. A flat, machined near the front of each camshaft, enables the camshafts to be locked during the valve timing procedure.

Camshaft Covers

E43445

The camshaft covers are manufactured from thermoplastic. Bank 1 camshaft cover incorporates an outlet for the part load engine breather and the pressure control valve. Bank 2 camshaft cover incorporates an outlet for the full load engine breather and the engine oil filler cap. Identical oil separators are incorporated below the breather outlet in each cover. Refer to: [Engine Emission Control](#) (303-08 Engine Emission Control - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

- NOTE: [LH](#) exhaust manifold shown, [RH](#) exhaust manifold similar.

Exhaust Manifolds

E94456

ItemDescription

1	Cylinder head
2	Gasket
3	Heat shield
4	Bolt
5	Gasket
6	LH exhaust manifold
7	Spacer (8 off)
8	Connector for AIR (secondary air injection) system (where fitted)
9	Bolt (8 off)
10	Heat shield
11	Bolt (4 off)

The cast stainless steel exhaust manifolds are unique for each cylinder bank. Each exhaust manifold installation includes two metal gaskets and two heat shields. Spacers on the securing bolts allow the manifolds to expand and contract with changes of temperature while maintaining the clamping loads.

Each exhaust manifold incorporates a connector for the [AIR](#) system (where fitted). Where an [AIR](#) system is not fitted, each connector is sealed with a cap nut. The [RH](#) exhaust manifold incorporates a connection flange for the [EGR \(exhaust gas recirculation\)](#) system.

Refer to: [Engine Emission Control](#) (303-08 Engine Emission Control - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

Lubrication System

E99283

Oil is drawn from the reservoir in the oil pan and pressurized by the oil pump. The output from the oil pump is then filtered, cooled and distributed through internal oil passages.

All moving parts are lubricated by pressure or splash oil. Pressurized oil is also provided for operation of the variable valve timing units and the timing gear chain tensioners.

The oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the quick return of the oil, reducing the volume of oil required and enabling an accurate check of the contents soon after the engine stops.

System replenishment is through the oil filler cap on the [LH](#) camshaft cover.

With the exception of the pump, all oil system components are installed on the structural sump.

Oil Pick-up

E72000

The fabricated steel oil pick-up is immersed in the oil reservoir to provide a supply to the oil pump during all normal vehicle attitudes. A mesh screen in the inlet prevents debris from entering the oil system.

Oil Pump

E43456

The oil pump is installed on the crankshaft at the front of the engine. The pump inlet and outlet ports align with oil passages in the bedplate.

The pumping element is an eccentric rotor, which is directly driven by flats on the crankshaft. An integral pressure relief valve regulates pump outlet pressure at 4.5 bar (65.25 lbf/in²).

Oil Filter Assembly

E99284

ItemDescription

1	Oil temperature sensor
2	Oil pressure switch
3	Filter head
4	Seal
5	O-ring seal
6	Engine oil cooler
7	Mounting bolt
8	Gasket
9	Filter

The oil filter is a replaceable cartridge with an internal bypass facility that permits full flow bypass if the filter is blocked. The oil filter is attached to the engine oil cooler, which is attached to a filter head installed on the front of the structural sump. The filter head also incorporates:

- An oil pressure switch.
Refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation).
- An oil temperature sensor.
Refer to: [Electronic Engine Controls](#) (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

The engine oil cooler is a liquid-to-liquid heat exchanger cooled by engine coolant. The coolant feed and return hoses for the engine oil cooler are connected to the radiator lower hose.
Refer to: [Engine Cooling](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

Oil Level Gage

E99285

The oil level gage locates along the left side of the oil pan, supported in a tube installed in the bedplate. Two holes in the end of the gage indicate the minimum and maximum oil levels. There is a difference of approximately 1.0 liter (1.0 US quart) between the two levels.

General Procedures

Special Tool(s)	
 <p>303-752</p> <p>E75849</p>	<p>Wrench, Oil filter</p> <p>303-752</p>

WARNING: The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

• NOTE: Clean the components general area prior to dismantling.

WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the air deflector.
For additional information, refer to: Air Deflector (501-02, Removal and Installation).

3. Remove the oil pan drain plug.

- Position a container to collect the fluid.
- Discard the oil pan drain plug seal.

4. Remove the oil filter.

- Position a container to collect the fluid.
- Discard the oil filter.

5. Using the special tool, install the oil filter.

6. Tighten the drain plug to 25 Nm.

- Install a new seal.

7. Fill the engine with oil.

8. Start engine and run at idle speed until the oil pressure warning light extinguishes.

- Stop the engine.

- Check for leaks.

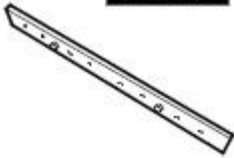

9. Install the air deflector.

For additional information, refer to: Air Deflector (501-02, Removal and Installation).

10. Check and top-up the engine oil.

Engine - 4.2L NA V8 - AJV8 - Valve Clearance Adjustment

General Procedures

Special Tool(s)	
 <p>303-540</p> <p>E65896</p>	<p>Tappet hold-down tool</p> <p>303-540</p>
 <p>303-540/02</p> <p>E65897</p>	<p>Tappet hold-down tool adaptor</p> <p>303-540/02</p>
 <p>DWST074</p>	<p>Fan nozzle - air gun</p> <p>303-590</p>

• CAUTIONS:

Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Check the valve clearances.
For additional information, refer to: [Valve Clearance Check](#) (303-01A Engine - 4.2L NA V8 - AJV8, General Procedures).
3. Rotate the engine clockwise to position the camshaft lobe away from the valve tappet.

4. Install the special tool 303-540, to the cylinder head.

- Tighten the 2 bolts to 10 Nm

5.  CAUTION: Do not rotate the crankshaft while the special tool 303-540/02 is attached to 303-540.

Attach the special tool 303-540/02 to 303-540.

- Secure with the 2 wing nuts.

6. Position the special tool to the tappet as shown.

7. Using the special tool, compress the valve spring.

E31420

8.  **CAUTION:** Do not use a magnet to remove shims. Failure to follow these instructions may result in damage to the vehicle.

• **NOTE:** Use the following formula to calculate the required shim thickness. Original shim thickness + measured shim clearance - desired clearance = required shim thickness.

Remove, clean and measure the shim.

- Surround the immediate working area with a cloth, to retain any loose shims displaced by the compressed air.
- Use the special tool 303-590, aimed at the edge of the shim, to lift it from the tappet. Note the position of each one.

9. CAUTIONS:

 Shims must be fitted with the size markings facing the tappet, not the camshaft.

 Do not use a magnet to install shims. Failure to follow these instructions may result in damage to the vehicle.

Install the new shim.

- Clean the components.
- Lubricate the shim with clean engine oil.
- Release and remove the special tools as required.

10. Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.

E46876

11. Repeat the above procedure for the remaining valves.

Engine - 4.2L NA V8 - AJV8 - Valve Clearance Check

General Procedures

• CAUTIONS:

Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the LH valve cover.
For additional information, refer to: [Valve Cover LH](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).
3. Remove the RH valve cover.
For additional information, refer to: [Valve Cover RH](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

4. CAUTIONS:

Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

Rotate the engine clockwise to position the camshaft lobe away from the valve tappet.

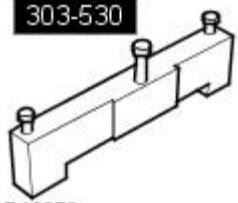

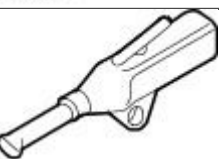

5. Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.

6. Repeat the above procedure for the remaining 11 shims.
7. Adjust the clearance as necessary.
8. For cylinder head data, refer to specifications.
For additional information, refer to: [Specifications](#) (303-01A Engine - 4.2L NA V8 - AJV8, Specifications).
9. Install the RH valve cover.
For additional information, refer to: [Valve Cover RH](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).
10. Install the LH valve cover.
For additional information, refer to: [Valve Cover LH](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).
11. Reconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

 <p>DWST074</p>	<p>Fan nozzle - air gun 303-590</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the engine front cover.

For additional information, refer to: [Engine Front Cover](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

4. Remove the crankshaft position (CKP) sensor.

For additional information, refer to: [Crankshaft Position \(CKP\) Sensor - 4.2L NA V8 - AJV8](#) (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

5. CAUTIONS:

 Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

 Rotate the crankshaft clockwise to position the engine to top dead center (TDC) number 1 cylinder.

Lock the crankshaft.

- Install the special tool.
- Install the screw.

6. Remove the LH variable camshaft timing (VCT) control solenoid housing.

- Remove the 2 bolts.
- Remove the nut.
- Remove and discard the O-ring seals.

VUJ0002400

E48360

7. Install the special tool to the LH cylinder head.

- Install the 3 bolts.
- Rotate the crankshaft until the flats on the camshafts are parallel with the cylinder head joint faces.

E46860

8. Remove the LH primary timing chain tensioner.

- Remove the 2 bolts.

9. Remove the LH upper and lower primary timing chain tensioner guides.

- Remove the 2 bolts.

10. Remove the LH primary timing chain.

11. Release the LH camshaft sprocket assembly.

- Remove and discard the 2 Torx bolts.

12. Remove the LH secondary timing chain, tensioner and sprocket assembly.

- Remove the 2 bolts.

E48364

13. Remove the special tool from the LH cylinder head.

14.  CAUTION: Evenly and progressively, release the camshaft bearing caps.

• NOTE: Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).

Remove the camshaft bearing caps.

- Remove the 20 bolts.

15. Remove the camshafts.

E46868

Installation

1. Install the camshafts.

- Clean the component mating faces.
- Replace the valve shims, with the smallest shim available.
- Lubricate the journals and camshaft lobes.

2. Install the camshaft bearing caps.

- Clean the component mating faces.
- Tighten the bolts to 10 Nm.

E52849

3. Install the special tool to the LH cylinder head.

- Install the 3 bolts.

4. Install the LH secondary timing chain tensioner retaining bolts.

- Tighten to 12 Nm.

5. Install the LH primary timing chain.

- Clean the components.
- Make sure the timing chain slack is on the tensioner side of the timing chain.

6. Install the LH primary timing chain tensioner guides.

- Clean the components.
- Tighten to 12 Nm.

7. **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

- NOTE: LH illustration shown, RH is similar.

Install the LH primary timing chain tensioner.

- Clean the components.
- Using 3 mm diameter metal rod, retain the chain tensioner piston.
- Remove the retaining rod.
- Tighten to 12 Nm.

8. CAUTIONS:

CAUTION: Using the special tool, apply force to the tool in a counter-clockwise direction, to tension the primary timing chain on its drive side.

CAUTION: The intake camshaft sprocket retaining bolt **MUST** be tightened before the exhaust camshaft sprocket retaining bolt. Engine damage will occur if this procedure is not followed.

CAUTION: Make sure that new bolts are installed.

Install the special tool to the LH exhaust camshaft sprocket.

- Tighten the intake camshaft sprocket retaining bolt to 20 Nm + 90 deg.
- Tighten the exhaust camshaft sprocket retaining bolt to 20 Nm + 90 deg.

9. Install the LH VCT control solenoid housing.

- Clean the components.

- Install the new O-ring seals.
- Tighten the nut to 10 Nm.
- Tighten to 22 Nm.

10. Remove the special tool from the LH cylinder head.

11. Remove the crankshaft locking tool.

- Remove the screw.

12. Install the CKP sensor.

For additional information, refer to: [Crankshaft Position \(CKP\) Sensor - 4.2L NA V8 - AJV8](#) (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

13. For cylinder head data, refer to specifications.

For additional information, refer to: [Specifications](#) (303-01A Engine - 4.2L NA V8 - AJV8, Specifications).

14. Rotate the engine clockwise to position the camshaft lobe away from the valve tappet.

15.  **CAUTION:** Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.

16. Repeat the above procedure for the remaining 15 shims.

17. Install the special tool 303-540, to the cylinder head.

- Tighten the two bolts to 10 Nm.

18.  **CAUTION:** Do not rotate the crankshaft while the special tool 303-540/02 is attached to 303-540.

Attach the special tool 303-540/02 to 303-540.

- Secure with the 2 wing nuts.

19. Position the special tool to the tappet as shown.

20. Using the special tool, compress the valve spring.

21.  **CAUTION:** Do not use a magnet to remove shims. Failure to follow these instructions may result in damage to the vehicle.

• **NOTE:** Use the following formula to calculate the required shim thickness. Original shim thickness + measured shim clearance - desired clearance = required shim thickness.

Remove, clean and measure the shim.

- Surround the immediate working area with a cloth, to retain any loose shims displaced by the compressed air.
- Use the special tool 303-590, aimed at the edge of the shim, to lift it from the tappet. Note the position of each one.

22. **CAUTIONS:**

 Shims must be fitted with the size markings facing the tappet, not the camshaft.

 Do not use a magnet to install shims. Failure to follow these instructions may result in damage to the vehicle.

Install the new shim.

- Clean the components.
- Lubricate the shim with clean engine oil.
- Release and remove the special tools as required.

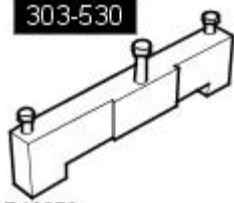

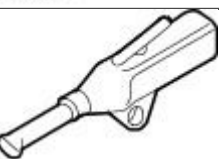

23. Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.

24. Repeat the above procedure for the remaining valves.
25. Install the engine front cover.
For additional information, refer to: [Engine Front Cover](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).
26. Connect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the engine front cover.

For additional information, refer to: [Engine Front Cover](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

4. Remove the crankshaft position (CKP) sensor.

For additional information, refer to: [Crankshaft Position \(CKP\) Sensor - 4.2L NA V8 - AJV8](#) (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

5. CAUTIONS:

 Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

 Rotate the crankshaft clockwise to position the engine to top dead center (TDC) number 1 cylinder.

Lock the crankshaft.

- Install the special tool.
- Install the screw.

6. Remove the RH variable camshaft timing (VCT) control solenoid housing.

- Remove the 3 bolts.
- Remove and discard the O-ring seals.

VUJ0002400

E46858

E46859

7. Install the special tool to the RH cylinder head.

- Rotate the crankshaft until the flats on the camshafts are parallel with the cylinder head joint faces.
- Install the 3 bolts.

8. Remove the RH primary timing chain tensioner.

- Remove the 2 bolts.

E46861

9. Remove the RH upper and lower primary timing chain tensioner guides.

- Remove the 2 bolts.

E66034

10. Remove the RH primary timing chain.

E46863

11. Release the RH camshaft sprocket assembly.

- Remove and discard the 2 Torx bolts.

E46865

12. Remove the RH secondary timing chain, tensioner and sprocket assembly.

- Remove the 2 retaining bolts.

13. Remove the special tool from the RH cylinder head.

- Remove the 3 bolts.

14.  CAUTION: Evenly and progressively, release the camshaft bearing caps.

• NOTE: Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).

Remove the camshaft bearing caps.

- Remove the 20 bolts.

15. Remove the camshafts.

Installation

1. Install the camshafts.

- Clean the component mating faces.
- Replace the valve shims, with the smallest shim available.
- Lubricate the journals and camshaft lobes.

2. Install the camshaft bearing caps.

- Clean the component mating faces.
- Tighten to 10 Nm.

3. Install the special tool to the RH cylinder head.

- Rotate the crankshaft until the flats on the camshafts are parallel with the cylinder head joint faces.
- Install the 3 bolts.

4.  **CAUTION:** Make sure the secondary timing chain and camshaft sprockets are free to rotate.

Install the RH secondary timing chain, tensioner and sprocket assembly.

- Clean the components.
- Install the Torx bolts, but do not tighten fully at this stage.

5. Install the RH secondary timing chain tensioner retaining bolts.

- Tighten to 12 Nm.

6. Install the RH primary timing chain.

- Clean the components.
- Make sure the timing chain slack is on the tensioner side of the timing chain.

7. Install the RH primary timing chain tensioner guides.

- Tighten to 12 Nm.

8.  **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the RH primary timing chain tensioner.

- Clean the components.
- Using 3 mm diameter metal rod, retain the chain tensioner piston.
- Tighten to 12 Nm.
- Remove the retaining rod.

9. CAUTIONS:

 Using the special tool, apply force to the tool in a counter-clockwise direction, to tension the primary timing chain on its drive side.

 The intake camshaft sprocket retaining bolt **MUST** be tightened before the exhaust camshaft sprocket retaining bolt. Engine damage will occur if this procedure is not followed.

Install the special tool to the RH exhaust camshaft sprocket.

- Tighten the exhaust camshaft sprocket retaining bolt to 20 Nm + 90deg.
- Tighten the intake camshaft sprocket retaining bolt to 20 Nm + 90 deg.
- Install new retaining bolts.

10. Install the RH VCT control solenoid housing.

- Clean the components.
- Install the new O-ring seals.
- Tighten to 22 Nm.

11. Remove the special tool from the RH cylinder head.

- Remove the 3 bolts.

12. Remove the crankshaft locking tool.

- Remove the screw.

13. Install the CKP sensor.

For additional information, refer to: [Crankshaft Position \(CKP\) Sensor - 4.2L NA V8 - AJV8](#) (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

14. For cylinder head data, refer to specifications.

For additional information, refer to: [Specifications](#) (303-01A Engine - 4.2L NA V8 - AJV8, Specifications).

15. Rotate the engine clockwise to position the camshaft lobe away from the valve tappet.

16.  **CAUTION:** Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.

17. Repeat the above procedure for the remaining 15 shims.

18. Install the special tool 303-540, to the cylinder head.

- Tighten the two bolts to 10 Nm.

E65899

19.  CAUTION: Do not rotate the crankshaft while the special tool 303-540/02 is attached to 303-540.

Attach the special tool 303-540/02 to 303-540.

- Secure with the 2 wing nuts.

E65900

20. Position the special tool to the tappet as shown.

J.303.530

21. Using the special tool, compress the valve spring.

E65901

E31420

22.  **CAUTION:** Do not use a magnet to remove shims. Failure to follow these instructions may result in damage to the vehicle.

• **NOTE:** Use the following formula to calculate the required shim thickness. Original shim thickness + measured shim clearance - desired clearance = required shim thickness.

Remove, clean and measure the shim.

- Surround the immediate working area with a cloth, to retain any loose shims displaced by the compressed air.
- Use the special tool 303-590, aimed at the edge of the shim, to lift it from the tappet. Note the position of each one.

23. CAUTIONS:

 Shims must be fitted with the size markings facing the tappet, not the camshaft.

 Do not use a magnet to install shims. Failure to follow these instructions may result in damage to the vehicle.

Install the new shim.

- Clean the components.
- Lubricate the shim with clean engine oil.
- Release and remove the special tools as required.

24. Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.

E46876

25. Repeat the above procedure for the remaining valves.

26. Install the engine front cover.

For additional information, refer to: [Engine Front Cover](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

27. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Removal

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the oil filter housing.
For additional information, refer to: [Oil Filter Housing](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

4. Release the accessory drive belt.

- Rotate the accessory drive belt tensioner counter-clockwise, using a 3/8 " drive wrench.

Left-hand drive vehicles

5. Disconnect the power steering control valve actuator electrical connector.

6. NOTE: Note the fitted position.

Disconnect the steering column lower shaft from the steering gear.

- Tie aside.

7. Detach the steering gear.

- Remove the 3 bolts.

All vehicles

8. Disconnect the secondary air injection (AIR) control valve to exhaust manifold tube.

9. Release the LH exhaust manifold heat shield.

10. Disconnect the AIR control valve to exhaust manifold tube.

11. Remove the crankshaft pulley.

- Using a suitable tool, release the crankshaft pulley.
- Collect the locking ring.

12. Check the crankshaft pulley and locking ring for damage.

E31151

13. Using the special tool, remove the crankshaft front seal.

E31171

Installation

All vehicles

1. CAUTIONS:

 Make sure the crankshaft seal mating faces are clean and dry.

 Do not remove the seal protector at this stage.

Using the special tool, install the crankshaft front seal.

- Clean the component mating faces.

2. Remove the seal protector.

E31173

E31150

3. Install the crankshaft pulley.

- Lubricate the seal with clean engine oil.
- Install the locking ring.

E31152

4.  CAUTION: The screw thread in the crankshaft pulley must be cleaned out before installing a new crankshaft pulley bolt.

Install, but do not tighten, the new crankshaft pulley bolt.

5.  CAUTION: Under no circumstances should the crankshaft setting peg, 303-645, be used in the following operations, to restrain the crankshaft.

Using the special tools, retain the crankshaft pulley.

- Tighten the crankshaft pulley bolt to 380 Nm.
- Remove the special tools.

6. Attach the accessory drive belt.

7. Connect the AIR control valve to exhaust manifold tube.

- Tighten to 35 Nm.

E99176

8. Secure the LH exhaust manifold heat shield.

- Tighten to 10 Nm.

9. Connect the AIR control valve to exhaust manifold tube.

- Tighten to 35 Nm.

Left-hand drive vehicles

10. Secure the steering gear.

- Tighten to 100 Nm.

VUJ0005142

11. Connect the steering column lower shaft.

- Tighten to 35 Nm.

VUJ0005119

12. Connect the power steering control valve actuator electrical connector.

All vehicles

13. Install the oil filter housing.
For additional information, refer to: [Oil Filter Housing](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).
14. Connect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L NA V8 - AJV8 - Crankshaft Rear Seal

In-vehicle Repair

Special Tool(s)	
 <p>E46616</p>	<p>Crankshaft rear oil seal remover/installer</p> <p>303-538</p>

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the flexplate.
For additional information, refer to: [Flexplate](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

- Install the special tools.

- Install the 2 bolts.
- Tighten the 2 nuts to retain the special tool.

E46613

- Using the special tool, pierce the seal to create holes for the 6 self-tapping screws.

E46614

5. Using the special tools, remove and discard the crankshaft rear oil seal.

- Install the 6 self-tapping screws.
- Adjust the 2 nuts.
- Tighten the center bolt.

E46615

Installation

1.  **CAUTION:** Do not lubricate the components.

Partially install the crankshaft rear oil seal.

- Make sure the components are clean and dry.
- Carefully remove the transit sleeve, leaving the seal on the crankshaft.

2. Install the special tools.

- Install the 2 bolts.
- Tighten the 2 nuts to retain the special tool.

E46613

3. Using the special tool, install the crankshaft rear oil seal.

- Tighten the special tool nuts evenly and progressively to fully install the seal.

E46613

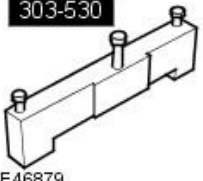

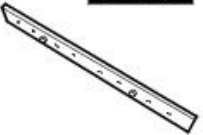

4. Install the flexplate.

For additional information, refer to: [Flexplate](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

5. Check and top-up the engine oil.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
3. Remove the intake manifold.
For additional information, refer to: [Intake Manifold](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).
4. Remove the timing drive components.
For additional information, refer to: [Timing Drive Components](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

5.  **CAUTION:** Evenly and progressively, release the camshaft bearing caps.

• NOTE: Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).

Remove the camshaft bearing caps.

- Remove the 20 bolts.

6. Remove the camshafts.

7. NOTE: Note the fitted position.

- NOTE: Make sure the shim remains with the tappet.

Remove the 16 tappets.

8. Remove the CMP sensor.

- Remove the Torx bolt.
- Remove and discard the O-ring seal.

9. Release the LH catalytic converter.

- Remove and discard the 2 nuts.

10. Remove the oil level indicator and tube.

- Discard the O-ring seal.

E46853

11. CAUTIONS:

 The bolts can only be used twice, mark the bolts with a center punch. If two punch marks are visible, discard the bolts.

 Vehicles fitted with Polydrive cylinder head bolts, the cylinder head bolts must be removed using a 10 mm Polydrive socket or a 10 mm Allen key. Failure to follow this instruction may result in damage to the component.

• **NOTE:** Remove the bolts in the indicated sequence.

Remove the 12 cylinder head bolts.

E46854

12.  CAUTION: The cylinder head must not be placed mating face down. Failure to follow this instruction may result in damage to the vehicle.

With assistance remove the cylinder head.

13. Remove and discard the cylinder head gasket.

- Clean the cylinder head locating dowels.
- Clean and inspect the cylinder head and cylinder block.

E67600

14. NOTE: Do not disassemble further if the component is removed for access only.

Remove the LH heat shield.

- Remove the 4 screws.

E67601

15. NOTE: Do not disassemble further if the component is removed for access only.

Remove the exhaust manifold.

- Remove and discard the 8 bolts.
- Remove the 8 spacers.

16. Remove and discard the exhaust manifold gasket.

- Remove the bolt.

Installation

1. Clean the component mating faces.
2. Check cylinder head face for distortion, across the center and from corner to corner.

3. For cylinder head face distortion data, refer to specifications.
For additional information, refer to: [Specifications](#) (303-01A Engine - 4.2L NA V8 - AJV8, Specifications).

4. NOTE: For cylinder head with distortion above the maximum allowance, the cylinder head material must be measured.

Measure the cylinder head material.

- Check measurement from the centre of the exhaust dowel to the cylinder head face as shown.
- If the measurement is less than 51.88 mm the cylinder head requires replacement.

5. Tighten to 50 Nm.

- Clean the component mating faces.

6. Tighten the new bolts in the sequence shown, to 24 Nm.

- Clean the component mating faces.
- Install the spacers.

E65731

7. Install the heat shield.

- Tighten the screws.

E67600

8.  **CAUTION:** The head gasket must be installed over the cylinder block dowels.

Install a new cylinder head gasket.

9. With assistance install the cylinder head.

10. **NOTE:** Tighten the bolts 1 to 10 in the sequence shown.

Install the cylinder head bolts.

- Lubricate the new cylinder head bolt threads with clean engine oil.
- Tighten the bolts 1 to 10 to 20 Nm.
- Tighten the bolts 1 to 10 to 35 Nm.
- Tighten the bolts 1 to 10, a further 90 degrees.
- Tighten the bolts 1 to 10, a further 90 degrees.
- Tighten the M8 bolts 11 and 12 to 25 Nm.

E46856

11. Install the oil level indicator and tube.

- Clean the components.
- Install a new O-ring seal.
- Lubricate the O-ring seal with clean engine oil.

12. Attach the catalytic converter.

- Tighten to 40 Nm.

13. Install the tappets.

- Clean the components.
- Lubricate the components with clean engine oil.

14. Install the camshafts.

- Clean the component mating faces.
- Lubricate the journals and camshaft lobes with clean engine oil.

15. Install the camshaft bearing caps.

- Clean the component mating faces.
- Tighten the bolts in the sequence shown to 10 Nm .

E48365

16. NOTE: RH illustration shown, LH is similar.

Install the special tool to the LH cylinder head.

- Install the 3 bolts.

E58803

17. NOTE: Do not install the LH valve cover until valve clearance adjustment has been completed.

Install the timing drive components.

For additional information, refer to: [Timing Drive Components](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

18. Rotate the engine clockwise to position the camshaft lobe away from the valve tappet.

19.  CAUTION: Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.

E46876

20. Repeat the above procedure for the remaining 15 shims.

21. Install the special tool 303-540, to the cylinder head.

- Tighten the two bolts to 10 Nm.

E65899

22.  CAUTION: Do not rotate the crankshaft while the special tool 303-540/02 is attached to 303-540.

Attach the special tool 303-540/02 to 303-540.

- Secure with the 2 wing nuts.

23. Position the special tool to the tappet as shown.

24. Using the special tool, compress the valve spring.

25.  CAUTION: Do not use a magnet to remove shims. Failure to follow these instructions may result in damage to the vehicle.

• NOTE: Use the following formula to calculate the required shim thickness.
 $\text{Original shim thickness} + \text{measured shim clearance} - \text{desired clearance} = \text{required shim thickness}$.

Remove, clean and measure the shim.

- Surround the immediate working area with a cloth, to retain any loose shims displaced by the compressed air.
- Use the special tool 303-590, aimed at the edge of the shim, to lift it from the tappet. Note the position of each one.

26. CAUTIONS:

 Shims must be fitted with the size markings facing the tappet, not the camshaft.

 Do not use a magnet to install shims. Failure to follow these instructions may result in damage to the vehicle.

Install the new shim.

- Clean the components.
- Lubricate the shim with clean engine oil.
- Release and remove the special tools as required.

27. Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.

28. Repeat the above procedure for the remaining valves.

29. Install the intake manifold.

For additional information, refer to: [Intake Manifold](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

30. Connect the battery ground cable and install the cover.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L NA V8 - AJV8 - Engine Front Cover

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Recover the A/C refrigerant.
3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.
Raise and support the vehicle.
4. Disconnect the engine oil temperature sensor electrical connector.

5. Disconnect the engine oil pressure (EOP) sensor electrical connector.

6. Remove the thermostat housing.
For additional information, refer to: [Thermostat Housing - 4.2L NA V8 - AJV8](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

7. Detach the oil filter housing.
 - Remove the 3 bolts.
 - Remove and discard the O-ring seal.

8. Remove the power steering pump.
For additional information, refer to: [Power Steering Pump -](#)

[4.2L NA V8 - AJV8](#) (211-02 Power Steering, Removal and Installation).

9. Remove the coolant expansion tank.

For additional information, refer to: [Coolant Expansion Tank](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

10. Disconnect the radiator upper hose.

- Release the clip.
- Disconnect the quick release connector.

E67373

11. Release the auxiliary coolant pump.

E98108

12. Release the radiator lower hose.

- Release the clip.

E98446

13. NOTE: Restrain the pulley to aid the removal of the bolts.

Remove the coolant pump pulley.

- Remove the 3 bolts.

14. Remove the LH valve cover.

For additional information, refer to: [Valve Cover LH](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

15. Remove the RH valve cover.

For additional information, refer to: [Valve Cover RH](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

16. Remove the crankshaft pulley.

For additional information, refer to: [Crankshaft Pulley](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

17. Remove the accessory drive belt idler pulley.

- Remove the bolt.

18. Remove the accessory drive belt tensioner.

- Remove the bolt.

E97758

19.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Disconnect the refrigerant lines from the A/C compressor.

- Remove the 2 bolts.
- Remove and discard the 2 O-ring seals.

E99244

20. Position the A/C compressor aside to access the A/C compressor mounting bracket.

21. Remove the A/C compressor mounting bracket.

- Remove the 4 bolts.

22. Remove the power steering pump mounting bracket.

- Remove the 4 bolts.

23. LH side: Release the wiring harness.

- Release the 2 clips.

24. Remove the engine front cover.

- Remove the 24 bolts.
- Remove and discard the 2 gaskets.
- Remove and discard the 3 O-ring seals.

VUJ0002018

Installation

1. To install, reverse the removal procedure.

- Apply a bead of sealant 3 mm diameter, by 12 mm long, to the 8 places indicated.

E47100

2. Tighten to 12 Nm.

E31273

3. Tighten to 25 Nm

E99246

4. Tighten to 25 Nm

5. Tighten to 20 Nm.

6. Tighten to 10 Nm.

7. Tighten to 9 Nm.

E97758

8. Tighten to 45 Nm.

E65905

9. Tighten to 45 Nm.

E65904

Engine - 4.2L NA V8 - AJV8 - Engine Mount LH

In-vehicle Repair

Removal

All vehicles

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

Left-hand drive vehicles

3. **NOTE:** Note the fitted position.

Detach the steering column lower shaft and tie aside.

4. Disconnect the power steering control valve actuator electrical connector.

5. Detach the steering gear.

- Remove the 3 bolts.

6. Secure the steering gear.

All vehicles

7. Release the engine mount.

- Support the engine.
- Remove and discard the nut.

8. Remove the engine mount and bracket.

- Raise the engine.
- Remove the 4 bolts.

9. NOTE: Do not disassemble further if the component is removed for access only.

Remove the engine mount.

- Remove and discard the nut.

Installation

1. To install, reverse the removal procedure.

- Tighten to 48 Nm.

E31200

2. Tighten to 47 Nm.

E98556

3. Tighten to 63 Nm.

E62721

4. Tighten to 100 Nm.

Engine - 4.2L NA V8 - AJV8 - Exhaust Manifold LH

In-vehicle Repair

Removal

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Release and tie aside the power steering reservoir.

E97798

4. Remove the oil level indicator and tube.
 - Remove the nut.
 - Discard the O-ring seal.

E46646

5. Remove the LH exhaust manifold heat shield retaining bolts.

6.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise the vehicle.

7. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).
8. Remove the LH catalytic converter.
For additional information, refer to: [Catalytic Converter](#) (309-00, Removal and Installation).

Left-hand drive vehicles

9. Disconnect the steering column lower shaft from the steering gear.

- Remove the steering column flexible coupling securing bolts.

10. Disconnect the steering gear control valve actuator electrical connector.

11. Detach the steering gear.

- Remove the steering gear retaining bolts.

12. Using suitable tie strap(s), secure the steering gear.

All vehicles

13. Remove the splash shield retaining clips.

- Position the splash shield to one side.

14. Remove the LH exhaust manifold heat shield retaining bolts.

- Remove the LH exhaust manifold heat shield.

Vehicles with secondary air injection (AIR)

15. Detach the secondary air injection (AIR) control valve to exhaust manifold tube from the exhaust manifold.

All vehicles

16. Remove the exhaust manifold.

- Remove and discard the 8 bolts.
- Remove the 8 spacers.

17. Remove and discard the LH exhaust manifold gasket.

- Remove the bolt.

Installation

All vehicles

1. Install the LH exhaust manifold gasket.

- Clean the component mating faces.
- Tighten the bolt to 50 Nm.

2. Install the LH exhaust manifold.

- Clean the component mating faces.
- Install the spacers.
- Evenly and progressively, tighten the new bolts in the sequence shown, to 24 Nm.

Vehicles with secondary air injection (AIR)

3. Attach the AIR control valve to exhaust manifold tube to the exhaust manifold.

- Tighten to 35 Nm.

All vehicles

4. Install the LH exhaust manifold heat shield.

- Tighten the bolts to 8 Nm.

Left-hand drive vehicles

5. Install the steering gear.

- Tighten the bolts to 100 Nm.

VUJ0005142

6. Connect the steering gear control valve actuator electrical connector.

E62469

7. Connect the lower steering column shaft to the steering gear.

- Tighten the bolts to 35 Nm.

All vehicles

8. Install the splash shield.

- Install the 2 clips.

9. Install the LH catalytic converter.

For additional information, refer to: Catalytic Converter (309-00, Removal and Installation).

10. Install the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

11. Lower the vehicle.

13. With assistance, install the oil level indicator and tube.

- Tighten the bolts to 8 Nm.

Clear the components.

- Install a new O-ring seal.

- Lubricate the O-ring seal with clean engine oil.

- Tighten the nut to 6 Nm.

14. Install the power steering fluid reservoir.

15. Connect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L NA V8 - AJV8 - Flexplate

In-vehicle Repair

Removal

1. Remove the transmission.
For additional information, refer to: [Transmission - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (307-01 Automatic Transmission/Transaxle - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. **NOTE:** Prevent the flexplate from rotating.

Remove the flexplate.

- Remove the 8 bolts.

E46527

Installation

1.  **CAUTION:** Make sure that the locating pin on the crankshaft is aligned with the guide hole in the flexplate.

To install, reverse the removal procedure.

- Tighten the bolts in the sequence shown in two stages.
- Tighten to 15 Nm.
- Tighten to 110 Nm.

E53833

Engine - 4.2L NA V8 - AJV8 - Exhaust Manifold RH

In-vehicle Repair

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the RH catalytic converter.
For additional information, refer to: Catalytic Converter (309-00, Removal and Installation).

4. Release the exhaust heat shield for access.

- Remove the 4 screws.

5. Disconnect the secondary air injection (AIR) control valve to exhaust manifold right-hand tube from the right-hand exhaust manifold.

6. Remove the RH exhaust manifold heat shield.

7. Release the EGR valve to exhaust manifold pipe.

- Remove the 2 nuts.
- Remove and discard the gasket.

Right-hand drive vehicles

8. NOTE: Note the fitted position.

Release the universal joint from the steering gear.

9. Disconnect the power steering control valve actuator electrical connector.

10. NOTE: LHD illustration shown, RHD is similar.

Release the steering gear.

- Remove the 3 bolts.

11. Support the steering gear.

E 31035

12. Disconnect the engine ground cable.

VUJ0005416

13. Release the starter motor positive cable.

VUJ0005418

14. Disconnect the battery positive cable from the generator.

VUJ0001368

15. Remove the exhaust manifold.
- Remove and discard the 8 bolts.
 - Remove the 8 spacers.

16. Remove and discard the exhaust manifold gasket.
- Remove the bolt.

In-vehicle Repair

Special Tool(s)	
 <p>310-D005</p> <p>E45289</p>	Fuel spring lock decoupling tool
	310-D005

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the air cleaner outlet pipe.
For additional information, refer to: [Air Cleaner Outlet Pipe](#) (303-12A Intake Air Distribution and Filtering - 4.2L NA V8 - AJV8, Removal and Installation).
3. Remove the throttle body.
For additional information, refer to: [Throttle Body](#) (303-04A Fuel Charging and Controls - 4.2L NA V8 - AJV8, Removal and Installation).
4. Disconnect the fuel rail pressure (FRP) sensor electrical connector.
 - Disconnect the FRP sensor vacuum line.

5. Disconnect the throttle body elbow vacuum line.
6. Disconnect the positive crankcase ventilation (PCV) line from the throttle body elbow.

7. Remove the engine cover LH bracket.

8. Remove the engine cover RH bracket.

9. Release the engine wiring harness from the intake manifold.

10. Release the exhaust gas recirculation (EGR) valve.

11. Release the RH camshaft position (CMP) sensor electrical connector.

E64542

12. Disconnect the fuel line.

E61611

13. Release the wiring harness from the rear of the engine.

E63947

14. Disconnect the manifold absolute pressure (MAP) sensor electrical connector.

E64534

15. Disconnect the 8 fuel injector electrical connectors.

16. Disconnect the fuel temperature sensor electrical connector.

17. Disconnect the brake booster vacuum hose from the intake manifold.

E64537

18.  CAUTION: Always plug any open connections to prevent contamination.

Remove the intake manifold.

E64538

19. NOTE: Do not disassemble further if the component is removed for access only.

Remove the foam pad.

E64539

20. Remove the throttle body elbow.

E64540

21. Remove the intake manifold MAP sensor housing.

E45492

22. Remove the 2 intake manifold housings.

3. Tighten to 10 Nm.

4. Tighten to 10 Nm.

5. Tighten to 10 Nm.

6. Tighten to 20 Nm.

E64538

7. Tighten to 20 Nm.

E64538

8. Tighten to 10 Nm.

E64540

9. Tighten to 10 Nm.

10. Tighten to 4 Nm.

Engine - 4.2L NA V8 - AJV8 - Oil Pan

In-vehicle Repair

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the air deflector.
For additional information, refer to: Air Deflector (501-02, Removal and Installation).
3. Drain the engine oil.
For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01A Engine - 4.2L NA V8 - AJV8, General Procedures).

- Position a container to collect the fluid.
- Discard the oil pan drain plug seal.

4. Remove the oil pan.

- Remove the 17 bolts.
- Remove and discard the gasket.

E31186

Installation

1. To install, reverse the removal procedure.
 - Tighten to 12 Nm.

E36705

Engine - 4.2L NA V8 - AJV8 - Oil Pan Extension

In-vehicle Repair

Removal

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).
4. Remove the transmission.
For additional information, refer to: [Transmission - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (307-01 Automatic Transmission/Transaxle - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Installation).
5. Remove the oil pan.
For additional information, refer to: [Oil Pan](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).
6. Remove the oil strainer pick-up assembly.

7. Disconnect the engine oil temperature sensor electrical connector.

8. Disconnect the engine oil pressure (EOP) sensor electrical connector.

9. Remove the oil filter housing.

- Remove the 3 bolts.
- Remove and discard the O-ring seal.

10. Detach the right-hand heated oxygen sensor (HO2S) electrical connector retaining bracket.

11. Detach the engine wiring harness from the oil pan extension.

12. Disconnect the crankshaft position (CKP) sensor electrical connector.

13. Remove the crankshaft position (CKP) sensor.

14. Remove the transmission bell housing to oil pan retaining bolts.

- Disconnect the engine ground cable.

15. Detach the left-hand HO2S electrical connector retaining bracket.

- Remove the retaining bolt.

16. Detach the wiring harness from the oil pan.

17. Detach the transmission fluid cooler tubes.

18. Remove the two lower bolts from the air conditioning (A/C) compressor bracket.

19. Remove the oil pan extension.

VUJ0002435

20. NOTE: Use only a plastic scraper when removing old gasket material.

• NOTE: Clean all the mating faces and reusable parts thoroughly and check for damage.

Apply a continuous bead of RTV sealant (Loctite 5699) 3 mm diameter, around the flange as indicated.

E32647

21. NOTE: It is important that the oil pan extension is bolted to the bedplate within 20 minutes of applying the RTV sealant.

Apply a continuous bead of RTV sealant (Loctite 5699) 2 mm diameter, around the diverter valve flange as indicated.

E32648

Installation

1. To install, reverse the removal procedure.

2. Tighten to 21 Nm.

E81046

3. Tighten to 10 Nm.

4. Tighten to 10 Nm.

5. Tighten to 48 Nm.

6. Tighten to 10 Nm.

7. Tighten to 10 Nm.

8. Tighten to 12 Nm.

9. Tighten to 21 Nm.

10. Tighten the bolts to 20 Nm.

Engine - 4.2L NA V8 - AJV8 - Oil Pump

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the timing drive components.
For additional information, refer to: [Timing Drive Components](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).
4. Remove the oil pan.
For additional information, refer to: [Oil Pan](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).
5. **NOTE:** The bolts will remain captive.

Remove the oil strainer pick-up assembly.

- Remove the 2 bolts.
- Remove and discard the O-ring seal.

E36704

6. Remove the oil pump assembly.

- Remove the 4 bolts.
- Remove and discard the O-ring seal.

E61762

Installation

1. To install, reverse the removal procedure.

2. Tighten to 12 Nm.

3. Tighten to 12 Nm.

Engine - 4.2L NA V8 - AJV8 - Secondary Timing Chain Tensioner

In-vehicle Repair

Removal

1. Remove the timing drive components.

For additional information, refer to: [Timing Drive Components](#)
(303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

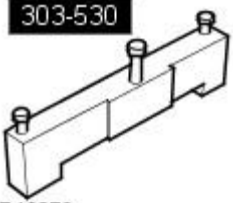

Installation

1. Install the timing drive components.

For additional information, refer to: [Timing Drive Components](#)
(303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

Engine - 4.2L NA V8 - AJV8 - Timing Drive Components

In-vehicle Repair

Special Tool(s)	
 <p>303-530 E46879</p>	<p>Camshaft setting/locking tool 303-530</p>
 <p>303-645 E46881</p>	<p>Timing Setting tool 303-645</p>
 <p>303-532 E46880</p>	<p>Timing chain tensioning tool 303-532</p>

Removal

• NOTE: This procedure covers the removal and installation of the following components: timing chains, chain guides, tensioners and sprockets.

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the engine front cover.
For additional information, refer to: [Engine Front Cover](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).
4. Remove the crankshaft position (CKP) sensor.
For additional information, refer to: [Crankshaft Position \(CKP\) Sensor - 4.2L NA V8 - AJV8](#) (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

5. CAUTIONS:

 Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

 Rotate the crankshaft clockwise to position the engine to top dead center (TDC) number 1 cylinder.

Lock the crankshaft.

- Install the special tool.
- Install the screw.

VUJ0002400

E46858

6. Remove the RH variable camshaft timing (VCT) control solenoid housing.

- Remove the 3 bolts.
- Remove and discard the O-ring seals.

E46859

7. Install the special tool to the RH cylinder head.

- Rotate the crankshaft until the flats on the camshafts are parallel with the cylinder head joint faces.
- Install the 3 bolts.

E46861

8. Remove the RH primary timing chain tensioner.

- Remove the 2 bolts.

E66034

9. Remove the RH upper and lower primary timing chain tensioner guides.

- Remove the 2 bolts.

10. Remove the RH primary timing chain.

E46863

11. Remove the LH variable camshaft timing (VCT) control solenoid housing.

- Remove the 2 bolts.
- Remove the nut.
- Remove and discard the O-ring seals.

E48360

12. Install the special tool to the LH cylinder head.

- Install the 3 bolts.

E46860

13. Remove the LH primary timing chain tensioner.

- Remove the 2 bolts.

E48361

14. Remove the LH upper and lower primary timing chain tensioner guides.

- Remove the 2 bolts.

E48362

15. Remove the LH primary timing chain.

E30710

16. Release the LH camshaft sprocket assembly.

- Remove and discard the 2 Torx bolts.

E48363

17. Remove the LH secondary timing chain, tensioner and sprocket assembly.

- Remove the 2 bolts.

E48364

18. Release the RH camshaft sprocket assembly.

- Remove and discard the 2 Torx bolts.

19. Remove the RH secondary timing chain, tensioner and sprocket assembly.

- Remove the 2 retaining bolts.

20. NOTE: Note the orientation of the crankshaft sprocket.

Remove the crankshaft sprocket.

- Remove the crankshaft sprocket key.

Installation

1. Install the crankshaft sprocket.

- Clean the components.
- Install the crankshaft sprocket key.

E66035

2.  CAUTION: Make sure the secondary timing chain and camshaft sprockets are free to rotate.

• NOTE: LH illustration shown, RH is similar.

Install the LH secondary timing chain, tensioner and sprocket assembly.

- Clean the components.
- Install the Torx bolts, but do not tighten fully at this stage.

E31268

3. Install the special tool to the exhaust camshaft sprocket.

- Reposition the camshaft sprockets for the most advantageous position for use of the special tool.

4. Install the LH secondary timing chain tensioner retaining bolts.

- Tighten to 12 Nm.

5. Install the LH primary timing chain.

- Clean the components.
- Make sure the timing chain slack is on the tensioner side of the timing chain.

6. Install the LH primary timing chain tensioner guides.

- Clean the components.
- Tighten to 12 Nm.

7.  CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

• NOTE: LH illustration shown, RH is similar.

Install the LH primary timing chain tensioner.

- Clean the components.
- Using 3 mm diameter metal rod, retain the chain tensioner piston.
- Remove the retaining rod.
- Tighten to 12 Nm.

E53556

8. CAUTIONS:

-  Using the special tool, apply force to the tool in a counter-clockwise direction, to tension the primary timing chain on its drive side.
-  The intake camshaft sprocket retaining bolt **MUST** be tightened before the exhaust camshaft sprocket retaining bolt. Engine damage will occur if this procedure is not followed.
-  Make sure that new bolts are installed.

Install the special tool to the LH exhaust camshaft sprocket.

- Tighten the intake camshaft sprocket retaining bolt to 20 Nm + 90 deg.
- Tighten the exhaust camshaft sprocket retaining bolt to 20 Nm + 90 deg.

9. Install the LH VCT control solenoid housing.

- Clean the components.
- Install the new O-ring seals.
- Tighten the nut to 10 Nm.
- Tighten to 22 Nm.

10. CAUTION: Make sure the secondary timing chain and camshaft sprockets are free to rotate.

Install the RH secondary timing chain, tensioner and sprocket assembly.

- Clean the components.
- Install the Torx bolts, but do not tighten fully at this stage.

11. Install the RH secondary timing chain tensioner retaining bolts.

- Tighten to 12 Nm.

12. Install the RH primary timing chain.

- Clean the components.
- Make sure the timing chain slack is on the tensioner side of the timing chain.

13. Install the RH primary timing chain tensioner guides.

- Tighten to 12 Nm.

14. CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the RH primary timing chain tensioner.

- Clean the components.
- Using 3 mm diameter metal rod, retain the chain tensioner piston.
- Tighten to 12 Nm.
- Remove the retaining rod.

15. CAUTIONS:

-  Using the special tool, apply force to the tool in a counter-clockwise direction, to tension the primary timing chain on its drive side.
-  The intake camshaft sprocket retaining bolt **MUST** be tightened before the exhaust camshaft sprocket retaining bolt. Engine damage will occur if this procedure is not followed.
-  Make sure that new bolts are installed.

Install the special tool to the RH exhaust camshaft sprocket.

- Tighten the intake camshaft sprocket retaining bolt to 20 Nm + 90 deg.
- Tighten the exhaust camshaft sprocket retaining bolt to 20 Nm + 90 deg.

16. Install the RH VCT control solenoid housing.

- Clean the components.
- Install the new O-ring seals.
- Tighten to 22 Nm.

17. Remove the special tool from the RH cylinder head.

- Remove the 3 bolts.

18. Remove the special tool from the LH cylinder head.

- Remove the 3 bolts.

19. Install the engine front cover.

For additional information, refer to: [Engine Front Cover](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

20. Remove the crankshaft locking tool.

- Remove the screw.

21. Install the CKP sensor.

For additional information, refer to: [Crankshaft Position \(CKP\) Sensor - 4.2L NA V8 - AJV8](#) (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

22. Install the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L NA V8 - AJV8 - Valve Cover LH

In-vehicle Repair

Special Tool(s)	
 <p>310-D005</p> <p>E45289</p>	Fuel spring lock decoupling tool
	310-D005

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the ignition coil-on-plug.
For additional information, refer to: [Ignition Coil-On-Plug - 4.2L NA V8 - AJV8](#) (303-07 Engine Ignition - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
3. Remove the remaining ignition coil-on-plugs.
4. Remove the oil level indicator and tube.
 - Remove the nut.
 - Remove and discard the O-ring seal.

5. Release the clip and disconnect the purge inlet line.

6. Remove the engine cover bracket.

- Remove the 2 nuts.
- Position the bracket aside.

7. Release the 3 wiring harness clips.

8. Disconnect the variable camshaft timing (VCT) oil control solenoid electrical connector.

9. Disconnect the valve cover breather hose.

10. Using the special tool, disconnect the fuel line.

- Release the clip.
- Position an absorbent cloth to collect fluid spillage.

11. Remove the secondary bulkhead LH panel.

For additional information, refer to: [Secondary Bulkhead Panel LH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).

12. NOTE: Note the fitted position of the retaining bolts prior to removal.

Remove the valve cover assembly.

- Remove the 14 valve cover retaining bolts.

13. Remove and discard the valve cover gasket.

- Carefully remove the sealant.

14. Remove the valve cover plug aperture seals.

15. Remove the VCT oil control solenoid seal.
16. NOTE: Do not disassemble further if the component is removed for access only.

Remove the oil filler pipe.

- Remove and discard the O-ring seal.

17. NOTE: Note the fitted position.

Remove the bolts, remove and discard the seals.

E61614

Installation

1. NOTE: Install the components to their original fitted positions.

Install the seals and bolts.

2. Install the oil filler pipe.

- Install a new O-ring seal.

3. Install new valve cover plug aperture seals.

4. Install a new valve cover gasket.

5. Install the new VCT oil control solenoid seal.

6. NOTE: Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3mm diameter 12mm long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

Install the valve cover.

- Clean the component mating faces.

E49922

7. Install the valve cover retaining bolts.

- Complete the tightening sequence as illustrated.
- Tighten to 12 Nm.

E46654

8. Install the secondary bulkhead LH panel.

For additional information, refer to: [Secondary Bulkhead Panel LH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).

E61609

9. Install the engine cover mounting bracket.

- Tighten to 10 Nm.

E61608

10. Connect the purge line.

11. Install the oil level indicator and tube.

- Install a new O-ring seal.
- Tighten to 6 Nm.

12. Connect the fuel line.

- Secure the clip.

13. Connect the VCT oil solenoid electrical connector.

14. Install the ignition coil-on-plug.

For additional information, refer to: [Ignition Coil-On-Plug - 4.2L NA V8 - AJV8](#) (303-07 Engine Ignition - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

15. Install the remaining ignition coil-on-plugs.

16. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L NA V8 - AJV8 - Valve Cover RH

In-vehicle Repair

Removal

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the ignition coil-on-plug.
For additional information, refer to: [Ignition Coil-On-Plug - 4.2L NA V8 - AJV8](#) (303-07 Engine Ignition - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
3. Remove the remaining ignition coil-on-plugs.
4. Release the 3 wiring harness clips.

E61617

5. Detach the positive crankcase ventilation (PCV) valve from the RH valve cover.

- Disconnect the vacuum hose.

E98529

6. Remove the engine cover bracket.

- Remove the 2 nuts.
- Position the bracket aside.

7. Remove the secondary bulkhead RH panel.

For additional information, refer to: [Secondary Bulkhead Panel RH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).

8. Remove the valve cover assembly.

- Remove the 14 valve cover retaining bolts.

9. Remove and discard the valve cover gasket.

- Carefully remove the sealant.

10. Remove the valve cover plug aperture seals.

11. NOTE: Note the fitted position.

Remove the bolts, remove and discard the seals.

E61627

Installation

1. To install, reverse the removal procedure.

- Tighten to 12 Nm.

E61620

2. Tighten to 10 Nm.

E61619

3. Tighten to 4 Nm.

Engine - 4.2L NA V8 - AJV8 - Oil Filter Housing

In-vehicle Repair

Special Tool(s)	
 <p>303-752</p> <p>E75849</p>	<p>Wrench, Oil filter</p> <p>303-752</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02, Removal and Installation).
4. Disconnect the engine oil temperature sensor electrical connector.

5. Disconnect the engine oil pressure (EOP) sensor electrical connector.

6. NOTE: Some oil spillage is inevitable during this operation.

• **NOTE:** Clean the components general area prior to dismantling.

Remove the oil filter.

- Position a container to collect the fluid.
- Drain the engine oil.

7. Detach the oil cooler housing from the oil filter housing.

8. Remove the oil filter housing.

- Remove the 3 bolts.
- Remove and discard the O-ring seal.

9. NOTE: Do not disassemble further if the component is removed for access only.

Remove the engine oil temperature and oil pressure sensors

Installation

1. NOTE: Do not disassemble further if the component is removed for access only.

Install the engine oil temperature and oil pressure sensors

2. Install the oil filter housing.

- Clean the component mating faces.
- Install a new O-ring seal.
- Tighten to 20 Nm.

3. Attach the oil cooler housing to the oil filter housing.

- Tighten to 58 Nm.

4. Using the special tool, install the oil filter.

- Lubricate the oil filter seal with clean engine oil and tighten to 18 Nm .

5. Connect the EOP sensor electrical connector.

6. Connect the engine oil temperature sensor electrical connector.

7. Install the air deflector.

For additional information, refer to: Air Deflector (501-02, Removal and Installation).

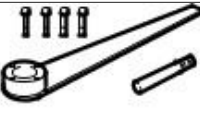

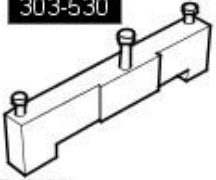

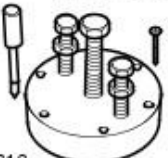

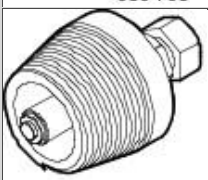

8. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

9. Check and top-up the engine oil.

Engine - 4.2L NA V8 - AJV8 - Crankshaft Main Bearing Carrier

Removal and Installation

Special Tool(s)

 <p>303-538</p> <p>E46616</p>	Crankshaft rear oil seal remover/installer 303-538
 <p>303-750</p>	Seal installer 303-750
 <p>303-751</p>	Seal extractor 303-751

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the engine.
For additional information, refer to: [Engine](#) (303-01A Engine - 4.2L NA V8 - AJV8, Removal).

4. Mount the engine to an engine stand.

5. Disconnect the 2 oil cooler hoses.

6. Remove the exhaust manifold heat shield.

- Remove the 2 bolts.

7. Release the accessory drive belt.

- Rotate the accessory drive belt tensioner counter-clockwise, using a 3/8 " drive wrench.

8. Remove the accessory drive belt tensioner.

- Remove the bolt.

9. NOTE: Note the fitted position of the accessory drive belt.

Remove the accessory drive belt.

10. Remove the accessory drive belt idler pulley.

- Remove the bolt.

11. NOTE: Restrain the pulley to aid the removal of the bolts.

Using the special tool, remove the coolant pump pulley.

- Remove and discard the 3 bolts.

12. Remove the coolant pump.

- Remove the 5 bolts.
- Remove and discard the gasket.

E62722

13. NOTE: Right-hand shown, left-hand similar.

Remove both the engine mounts and brackets.

- Remove the 4 bolts.
- Repeat the above procedure for the other side.

E65278

14. Remove the air conditioning (A/C) compressor.

- Remove the 3 bolts.
- Disconnect the electrical connector.

15. Remove the power steering pump.

- Remove the 4 bolts.

E30644

16. Remove the A/C compressor mounting bracket.

- Remove the 4 bolts.

E65906

E65907

17. Remove the power steering pump mounting bracket.

- Remove the 4 bolts.

E62716

18. Disconnect the battery positive cable and the generator electrical connector.

- Release the cover.
- Remove the nut.
- Disconnect the electrical connector.

E30626

19. Remove the generator.

- Remove the nut.
- Remove the nut and bolt.

20. RH side: Release the engine wiring harness.

- Release the 5 clips.

21. Remove the generator mounting bracket.

- Remove the 4 bolts.

22. Disconnect the battery positive cable.

- Release the cover.
- Remove the nut.

23. Disconnect the starter motor solenoid electrical connector.

- Remove and discard the nut.

24. Remove the starter motor.

- Remove the 2 bolts.

25. Remove the coolant manifold.

- Release the clips and disconnect the 4 coolant hoses.
- Remove the 4 bolts.
- Disconnect the engine coolant temperature (ECT) sensor electrical connector.

26. NOTE: Some oil spillage is inevitable during this operation.

- NOTE: Clean the components general area prior to dismantling.

Remove the oil filter.

27. Disconnect the engine oil pressure (EOP) sensor electrical connector.

28. Disconnect the engine oil temperature sensor electrical connector.

E82653

29. Remove the oil filter housing.

- Remove the 3 bolts.
- Remove and discard the O-ring seal.

VUJ0001584

30. NOTE: Right-hand shown, left-hand similar.

Release the 2 heated oxygen sensor (HO2S) harness brackets.

E30646

31. Disconnect the crankshaft position (CKP) sensor electrical connector.

E58488

32. Release the engine wiring harness.

- Release the 2 clips.
- Remove the bolt.

33. Release the wiring harness from the LH side of the engine.
- Release the clips.

34. Release the wiring harness from the RH side of the engine.
- Release the clips.

35. Remove the CKP sensor.
- Remove the bolt.

36.  **CAUTION:** Under no circumstances should the crankshaft setting peg, 303-645, be used in the following operations, to restrain the crankshaft.

Using the special tools, retain the crankshaft pulley.

37. NOTE: The crankshaft pulley retaining bolt will be very tight.

Using the special tools, remove the crankshaft pulley bolt.

- Discard the bolt.
- Remove the special tools.

38. NOTE: The crankshaft pulley will be very tight.

Using the special tools, remove the crankshaft pulley.

- Collect the locking ring.
- Remove the special tools.

E46724

39. Using the special tool, remove and discard the crankshaft front seal.

40. NOTE: Right-hand shown, left-hand similar.

Remove both the ignition coil-on-plug covers.

- Release from the 2 clips.

41. Disconnect the RH ignition coil-on-plug electrical connector.

42. Remove the RH ignition coil-on-plug.

- Remove the bolt.
- Remove and discard the seal.

43. Remove the remaining RH ignition coil-on-plugs.

44. Disconnect the positive crankcase ventilation (PCV) line.

45. Disconnect the LH variable camshaft timing (VCT) oil solenoid electrical connector.

46. Disconnect the valve cover breather hose.

47. Release the engine wiring harness from the retaining bracket.

48. Disconnect the RH variable camshaft timing (VCT) oil solenoid electrical connector.

49. NOTE: Note the fitted position of the retaining bolts prior to removal.

Remove the RH valve cover.

- Remove the 14 valve cover retaining bolts.
- Remove the engine cover bracket.

E30696

50. Remove and discard the RH valve cover gaskets.

- Remove and discard the seals.

E46677

51. Disconnect the LH ignition coil-on-plug electrical connector.

E46066

52. Remove the LH ignition coil-on-plug.

- Remove the bolt.
- Remove and discard the seal.

E46053

53. Remove the remaining LH ignition coil-on-plugs.

E46646

54. Remove the oil level indicator and tube.

- Remove the oil level indicator.
- Remove the nut.
- Remove the tube.
- Remove and discard the O-ring seal.

E46647

55. Release the engine wiring harness from the retaining bracket.

56. NOTE: Note the fitted position of the retaining bolts prior to removal.

Remove the LH valve cover.

- Remove the 14 valve cover retaining bolts.

E30696

57. Remove and discard the LH valve cover gaskets.

- Remove and discard the seals.

E46652

58. NOTE: Install the special tool to the crankshaft sensor aperture.

Lock the crankshaft.

- Install the special tool.
- Install the bolt.

E61688

59. Remove the engine front cover.

- Remove the 24 bolts.
- Remove and discard the gasket.
- Remove and discard the 3 O-ring seals.

VUJ0002398

60. Remove the RH VCT housing.

- Remove the 3 bolts.
- Remove and discard the O-ring seals.

E30699

61. Install the special tool to the RH cylinder head.

- Install the 3 bolts.

62. Remove the RH primary timing chain tensioner assembly.

- Remove the 2 bolts.

63. Remove the RH primary timing chain tensioner guide.

- Remove the bolt.

64. Remove the RH primary timing chain.

65. Remove the LH VCT housing.
- Remove the 3 bolts.
 - Remove and discard the O-ring seals.

66. Install the special tool to the LH cylinder head.
- Install the 3 bolts.

67. Remove the LH primary timing chain tensioner.
- Remove the 2 bolts.

68. Remove the LH upper and lower primary timing chain tensioner guides.
- Remove the 2 bolts.

69. Remove the LH primary timing chain.

70. NOTE: Note the orientation of the crankshaft sprocket.

Remove the crankshaft sprocket.

- Remove the crankshaft sprocket key.

71. Remove the special tool.

72. Remove the torque converter flexplate.

- Remove and discard the 8 bolts.

73.  CAUTION: Note the position of the bolts, prior to removal.

Remove the oil pan.

- Remove the 17 bolts.
- Remove and discard the gasket.

74. Remove the oil strainer pick-up assembly.

- Remove the 2 bolts.
- Remove and discard the O-ring seal.

75. Remove the oil pan extension.

- Remove the 18 bolts.

VUJ0002435

76. Remove the oil pump assembly.
- Remove the 4 bolts.
 - Remove and discard the gasket.
 - Clean the component mating faces.

77. Remove the baffle plate.
- Remove the 6 bolts.

78.  **WARNING:** To make sure damage does not occur to the crankshaft and piston components, the engine must be inverted on the engine stand. Failure to follow this instruction may result in damage to the engine.

- **NOTE:** If the crankshaft main bearing carrier retaining bolts have been marked with a center punch dot, they must be discarded and new bolts installed.

Remove the crankshaft main bearing carrier.

- Remove the crankshaft main bearing carrier retaining bolts in the indicated sequence.

VUJ0002439

VUJ0002440

79. Discard the crankshaft rear main oil seal.

Installation

1. CAUTIONS:

Use only a plastic scraper when removing the sealing material.

If any new bolts are to be installed to retain the crankshaft main bearing carrier, pre-stress the retaining bolts by installing the crankshaft main bearing carrier without any sealant and tightening the new retaining bolts to the specified torque. Remove the crankshaft main bearing carrier once the bolts have been pre-stressed. Failure to follow this instruction may result in damage to the vehicle.

Clean all the mating faces and reusable parts thoroughly and check

E82654

for damage.

2. NOTE: Install the crankshaft main bearing carrier and tighten bolts to specification within twenty minutes of applying the sealant.

Apply a 2 mm bead of sealant to the cylinder block in the area shown.

- Use WSS-M4G323-A4-RTV sealant.

E82655

3. NOTE: Install the crankshaft main bearing carrier and tighten bolts to specification within twenty minutes of applying the sealant.

Apply a 1 mm bead of sealant to the cylinder block in the area shown.

- Use WSS-M4G323-A4-RTV sealant.

4. CAUTION: Make sure all dowels are fully seated into the crankshaft main bearing carrier prior to tightening the bolts.

- NOTE: Do not lubricate the crankshaft main bearing carrier retaining bolts.
- NOTE: Do not rotate the crankshaft until all the retaining bolts are tightened to specification.
- NOTE: The retaining bolts must be tightened within twenty minutes of applying the sealant.
- NOTE: Tighten the retaining bolts in the sequence shown.

Install the crankshaft main bearing carrier to the cylinder block.

1. Stage 1: Bolts 21 to 32, tighten to 15 Nm.
2. Stage 2: Bolts 33 to 34, tighten to 15 Nm.
3. Stage 3: Bolts 1 to 10, tighten to 25 Nm.
4. Stage 4: Bolts 11 to 20, tighten to 15 Nm.
5. Stage 5: Bolts 1 to 10, tighten to 35 Nm, then a further 135 degrees.
6. Stage 6: Bolts 11 to 20, tighten to 20 Nm, then a further 150 degrees.
7. Stage 7: Bolts 21 to 32, tighten to 20 Nm, then a further 90 degrees.
8. Stage 8: Bolts 33 to 34, tighten to 20 Nm, then a further 150 degrees.
9. Stage 9: Center punch each of the bolt heads to indicate it has been reused.

VUJ0002450

5. Rotate the crankshaft to check correct operation.
6. Remove excess sealant which may squeeze out at the front cover sealing surfaces.
7. Install the baffle plate.
 - Tighten the 6 bolts to 6 Nm.

E31176

E31177

E31176

E61688

8. NOTE: Carefully remove the transit sleeve, leaving the seal in place.

• NOTE: Make sure that the transit sleeve is correctly positioned and install the new seal over the crankshaft. Do not use any lubricant on the seal, the transit sleeve or the crankshaft.

Using the special tool, position the crankshaft rear oil seal.

- Install the special tool to the crankshaft.

9.  CAUTION: Alternate the nut tightening to correctly seat the crankshaft rear oil seal.

Using the special tool, install the rear crankshaft oil seal.

10.  CAUTION: Make sure that the crankshaft rear oil seal is correctly located.

Remove the special tool.

11. Install the special tool.

- Install the bolt.

12. NOTE: Install a new gasket.

Install the oil pump assembly.

- Clean the component mating faces.
- Install the gasket.
- Tighten the bolts to 10 Nm.

E53833

13. NOTE: Prevent the flexplate from rotating.

Install the torque converter flexplate.

- Clean the component mating faces.
- Tighten the bolts evenly in 2 stages to the sequence shown.
- Tighten the bolts to 15 Nm.
- Tighten the bolts to 110 Nm.

14. NOTE: Install a new O-ring seal.

Install the oil strainer pick-up assembly.

- Install the O-ring seal.
- Tighten the bolts to 12 Nm.

15. Install the crankshaft sprocket.

- Clean the component mating faces.
- Install the crankshaft sprocket key.

16. Install the LH primary timing chain.

- Make sure the timing chain slack is on the tensioner side of the timing chain.

17. Install the LH primary timing chain tensioner guides.

- Tighten the bolts to 12 Nm.

18. ⚠ CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the LH primary timing chain tensioner.

- Using a 3 mm diameter rod, retain the timing chain tensioner adjuster.
- Tighten the bolts to 12 Nm.
- Remove the retaining rod.

E46871

19. ⚠ CAUTION: Make sure that new bolts are installed.

• NOTE: Install new O-ring seals.

Install the LH VCT control solenoid housing.

- Install the O-ring seals.
- Tighten the bolts to 22 Nm.
- Tighten the nut to 10 Nm.

20. Install the RH primary timing chain.

- Make sure the timing chain slack is on the tensioner side of the timing chain.

21. Install the RH primary timing chain tensioner guide.

- Tighten the bolts to 12 Nm.

E53556

22.  **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the RH primary timing chain tensioner.

- Using a 3 mm diameter rod, retain the timing chain tensioner adjuster.
- Tighten the bolts to 12 Nm.
- Remove the retaining rod.

23. **NOTE:** Install new O-ring seals.

• **NOTE:** Make sure that new bolts are installed.

Install the RH VCT control solenoid housing.

- Install the O-ring seals.
- Tighten the bolts to 22 Nm.
- Tighten the nut to 10 Nm.

24. Remove the special tool from the RH cylinder head.

E46859

25. Remove the special tool from the LH cylinder head.

E46860

26. Install the oil pan extension.

- Clean the component mating faces.
- Apply a 3 mm diameter bead of sealant, to the area shown.
- Install the bolts, but do not tighten fully at this stage.

E48537

27. Tighten the oil pan bolts in the sequence shown to 20 Nm.

E61699

28. Remove the special tool.

- Remove the bolt.

E61688

29. Install the CKP sensor.

- Tighten the bolt to 8 Nm.

30. Attach the wiring harness to the LH side of the engine

- Secure the clips.

31. Attach the wiring harness to the RH side of the engine.

- Secure the clips.

32. Install the power steering pump mounting bracket.

- Tighten the bolts to 25 Nm.

E47100

33. NOTE: Install a new gasket.

• NOTE: Install a new O-ring seal.

Install the engine front cover.

- Clean the component mating faces.
- Apply a 3 mm diameter bead of sealant 12mm long, to the 8 places shown.
- Install the gasket.
- Install the O-ring seal.

E47101

34. Tighten the bolts in the sequence shown to 12 Nm.

35. Attach the engine wiring harness.

- Secure the clips.
- Tighten the bolt to 10 Nm.

36. NOTE: Install new seals.

Install the LH valve cover plug aperture seals.

37. NOTE: Install a new gasket.

• NOTE: Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3 mm (0.118 in) diameter 12 mm (0.47 in) long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

E49922

Install the LH valve cover.

- Clean the component mating faces.
- Install the valve cover gasket.

E46654

38. Install the LH valve cover bolts.

- Install the LH valve cover bolts to the positions previously noted.
- Tighten the bolts in the sequence shown to 12 Nm.

39. Connect the LH VCT oil solenoid electrical connector.

40. Attach the engine wiring harness to the retaining bracket.

41. NOTE: Install a new O-ring seal.

With assistance, install the oil level indicator and tube.

- Clean the component mating faces.
- Install the O-ring seal.
- Lubricate the O-ring seal with clean engine oil.
- Tighten the nut to 6 Nm.

42. NOTE: Install new O-ring seals.

Install the 4 LH ignition coil-on-plugs.

- Install the O-ring seals.
- Install the 4 ignition coil-on-plugs.
- Tighten the 6 bolts to 6 Nm.

43. Connect the 4 electrical connectors.

44. Install the LH ignition coil-on-plug cover.

45. NOTE: Install new seals.

Install new RH valve cover plug aperture seals.

46. NOTE: Install a new gasket.

• NOTE: Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3 mm (0.118 in) diameter 12 mm (0.47 in) long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

Install the RH valve cover.

- Clean the component mating faces.
- Install the gasket.

E49922

E46679

47. Install the RH valve cover bolts.

- Install the RH valve cover bolts to the positions previously noted.
- Tighten the bolts in the sequence shown to 12 Nm.

48. NOTE: Install new O-ring seals.

Install the 4 RH ignition coil-on-plugs.

- Install the O-ring seals.
- Install the 4 ignition coil-on-plugs.
- Tighten the bolts to 6 Nm.

49. Connect the 4 electrical connectors.

50. Connect the RH VCT oil solenoid electrical connector.

51. Attach the engine wiring harness to the retaining bracket.

52. Connect the PCV line to the RH valve cover.

53. Clean the crankshaft pulley mating faces.

E31173

54. Using the special tool, install the crankshaft front seal.

- Lubricate the seal with clean engine oil.
- Use the discarded crankshaft bolt with the special tool.
- Remove the special tools.

55. Install the crankshaft pulley.

- Lubricate the seal with clean engine oil.

56. Install the crankshaft pulley locking ring.

57. **CAUTION:** The screw thread in the crankshaft pulley must be cleaned out before installing a new crankshaft pulley bolt.

Install, but do not tighten, the new crankshaft pulley bolt.

58. **CAUTION:** Under no circumstances should the crankshaft setting peg, 303-645, be used in the following operations, to restrain the crankshaft.

Using the special tools, tighten the crankshaft pulley bolt.

- Remove the special tools.
- Tighten the crankshaft pulley bolt to 380 Nm.

E120172

59. **NOTE:** Install a new O-ring seal.

Install the oil filter housing.

- Clean the component mating faces.
- Install a new O-ring seal.
- Tighten the bolts to 20 Nm.

60. **NOTE:** Install a new engine oil filter.

Install the engine oil filter.

- Lubricate the oil filter seal with clean engine oil and tighten to 18 Nm .

61. Connect the EOP sensor electrical connector.

62. Connect the engine oil temperature sensor electrical connector.

63. Install the starter motor.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm.

64. NOTE: Install new O-ring seals.

Install the coolant manifold.

- Clean the components.
- Install the O-ring seals.
- Connect the 4 coolant hoses and install the clips.
- Attach the wiring harness bracket.
- Tighten the bolts to 10 Nm.

65. Connect the starter motor solenoid electrical connector.

- Tighten the new nut to 7 Nm.

66. Connect the battery positive cable to the starter motor.

- Tighten the nut to 10 Nm.
- Secure the cover.

67. Install the generator mounting bracket.

- Tighten the bolts to 25 Nm.

68. RH side: Attach the wiring harness.

- Secure the clips.

69. Install the generator.

- Tighten the nut to 25 Nm.
- Tighten the nut and bolt to 40 Nm.

70. Connect the battery positive cable and generator electrical connector.

- Secure the cover.
- Tighten the nut to 12 Nm.

71. Install the exhaust manifold heat shield.

- Tighten the 2 bolts.

72. Install the power steering pump mounting bracket.

- Tighten the bolts to 25 Nm.

73. Install the A/C compressor mounting bracket.

- Tighten the bolts to 25 Nm.

74. Install the power steering pump.

- Tighten the bolts to 25 Nm.

75. Install the A/C compressor.

- Tighten the bolts to 25 Nm.
- Connect the electrical connector.

76. Install both engine mounts and brackets.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm.
- Repeat the above procedure for the other side.

E30680

77. NOTE: Make sure that new bolts are installed.

Using the special tool, install the coolant pump pulley.

- Tighten the 5 bolts to 10 Nm.
- Tighten the bolts to 25 Nm.

78. Install the accessory drive belt idler pulley.

- Tighten the bolts to 25 Nm.

79. Install the accessory drive belt.

E54120

80. Install the accessory drive belt tensioner.

- Clean and inspect the drive pulleys for damage.
- Tighten the accessory drive belt tensioner bolt to 40 Nm.

81. Connect the oil cooler hoses.

82. Remove the engine from the engine stand.

83. Install the engine.

For additional information, refer to: [Engine](#) (303-01A Engine - 4.2L NA V8 - AJV8, Removal).

84. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L NA V8 - AJV8 - Engine

Removal

Special Tool(s)	
 303-536	Engine lifting brackets 303-536

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Evacuate the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
4. Remove the transmission.
For additional information, refer to: [Transmission - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (307-01 Automatic Transmission/Transaxle - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal).
5. Install the torque converter retainer.
6. Remove the cooling module.
For additional information, refer to: [Cooling Module - 4.2L NA V8 - AJV8](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

7. Remove the hood.

8. Remove the throttle body.
For additional information, refer to: [Throttle Body](#) (303-04A Fuel Charging and Controls - 4.2L NA V8 - AJV8, Removal and Installation).

9. Disconnect the battery positive cable from the generator.

10. NOTE: RH illustration shown, LH is similar.

Release the engine mounts.

- Remove and discard the 2 nuts.

11. Lower the vehicle.

12. Remove the secondary bulkhead LH panel.

For additional information, refer to: [Secondary Bulkhead Panel LH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).

13. Remove the engine control module (ECM) cover.

E30422

14. Release the ECM wiring harnesses and position aside.

E100914

15. Disconnect the engine wiring harness.

E100915

16. Disconnect the fuel line.

17.  CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Release the clip and disconnect the purge inlet line.

18. Disconnect the brake booster vacuum hose from the intake manifold.

E97758

19.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Disconnect the refrigerant lines from the A/C compressor.

- Remove the 2 bolts.
- Remove and discard the 2 O-ring seals.

E98591

20.  **CAUTION:** Always plug any open connections to prevent contamination.

Disconnect the high pressure line from the power steering pump.

- Remove and discard the O-ring seal.

E98592

21.  **WARNING:** Fluid loss is unavoidable, use absorbent cloth or a container to collect the fluid.

 **CAUTION:** Always plug any open connections to prevent contamination.

Disconnect the low pressure line from the power steering pump.

- Release the clip.

22. Disconnect the crankshaft position (CKP) sensor electrical connector.

23. Install the special tools to the engine.

- Support the engine.

24. Install the lifting equipment to the vehicle.

- Install the lifting chains.

25. Remove the engine.

- With assistance, carefully remove the engine.

E31824

Engine - 4.2L NA V8 - AJV8 - Engine

Installation

Special Tool(s)	
 <p>303-536</p>	Engine lifting brackets 303-536
 <p>303-749</p>	Engine lifting brackets 303-749

Installation

- Carefully lower the engine onto the engine mounts.
 - Clean the components.
- Remove the special tools.
- Connect the brake booster vacuum hose to the intake manifold.

-  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Connect the purge valve.

5. Connect the main engine wiring harness to the ECM.

6. Connect the engine wiring harness.

- Tighten to 10 Nm.

7. Connect the fuel line.

8. Raise the vehicle.

9. Connect the battery positive cable to the generator.

10. Connect the CKP sensor electrical connector.

11.  **WARNING:** Fluid loss is unavoidable, use absorbent cloth or a container to collect the fluid.

 **CAUTION:** Always plug any open connections to prevent contamination.

Connect the low pressure line to the power steering pump.

- Secure the clip.

12.  **CAUTION:** Always plug any open connections to prevent contamination.

Connect the high-pressure power steering line to the power steering pump.

- Install a new O-ring seal.
- Tighten to 20 Nm.

E97758

13.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Connect the refrigerant lines to A/C compressor.

- Install the 2 bolts.
- Install new O-ring seals.

E63598

14. **NOTE:** Right-hand shown, left-hand similar.

Install the engine mounts lower retaining nuts.

- Tighten to 63 Nm.

15. Remove the torque converter retainer.

16. Install the transmission.

For additional information, refer to: [Transmission - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (307-01 Automatic Transmission/Transaxle - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal).

17. Lower the vehicle.

18. Install the secondary bulkhead LH panel.

For additional information, refer to: [Secondary Bulkhead Panel LH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).

19. Install the cooling module.

For additional information, refer to: [Cooling Module - 4.2L NA V8 - AJV8](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

20. Install the throttle body.

For additional information, refer to: [Throttle Body](#) (303-04A Fuel Charging and Controls - 4.2L NA V8 - AJV8, Removal and Installation).

21. Recharge the A/C system.

For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).

22. Install the hood.

- Tighten to 25 Nm

E100919

23. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L SC V8 - AJV8 - Engine - Overview

Description and Operation

Overview

The liquid cooled V8 supercharged engine is a 4.2 liter unit, arranged in a 90 degree 'V' configuration, with a 4-throw crankshaft supported by 5 main bearings.

The lightweight cylinder block is of cast aluminum alloy construction with cast iron liners.

The cylinder heads, which are also manufactured in cast aluminum alloy, are unique for each cylinder bank. Deep seated bolts reduce distortion and secure the cylinder heads to the cylinder block. Each cylinder head incorporates 2 overhead camshafts, operating 4 valves per cylinder via valve lifters. A [VVT \(variable valve timing\)](#) system gives improved low and high-speed engine performance and excellent idle quality. The lightweight valve gear provides good economy and noise levels and is chain driven, via the crankshaft, for durability.

The aluminum alloy bedplate is a casting bolted to the bottom of the cylinder block to retain the crankshaft and improve lower structure rigidity. The oil pan assembly consists of a pressed steel oil pan bolted to a structural aluminum alloy casting, which is then bolted to the bedplate.

Engine - 4.2L SC V8 - AJV8 - Engine - System Operation and Component Description

Description and Operation

System Operation

General

Operation of the engine is controlled by the [ECM \(engine control module\)](#).

Refer to: Electronic Engine Controls (303-14 Electronic Engine Controls - 2.7L Diesel, Description and Operation).

Variable Valve Timing

When directed by the [ECM](#), the [VVT \(variable valve timing\)](#) unit will be set to the optimum position between full advance and retard for a particular engine speed and load. This is achieved when the [ECM](#) sends the energizing signal to the oil control solenoid until the target position is met. At this point, the energizing signal is reduced to hold the solenoid position, and as a result the position of the shuttle valve. This function is under closed-loop control, where the [ECM](#) will alter the energizing signal, when required, to maintain the desired position.

Engine oil properties and temperature can affect the ability of the [VVT](#) mechanism to follow demand changes to the cam phase angle. At very low oil-temperatures, movement of the [VVT](#) mechanism is sluggish due to increased viscosity, and at high oil-temperatures the reduced viscosity may impair operation if the oil pressure is too low. To maintain satisfactory [VVT](#) performance, an increased capacity oil pump is installed, plus an engine oil temperature sensor to enable monitoring by the [ECM](#). The [VVT](#) system is normally under closed-loop control except in extreme temperature conditions, such as cold starts below 0 °C (32 °F). At extremely high oil-temperatures, the [ECM](#) may limit the amount of [VVT](#) advance to prevent the engine from stalling when returning to idle speed.

The [VVT](#) does not operate when engine oil-pressure is below 1.25 bar (18.1 lbf/in²), as there is insufficient pressure to release the [VVT](#) unit's internal stopper pin. This usually occurs when the engine is shutting-down and the [VVT](#) has returned to the retarded position. The stopper pin locks the camshaft to the [VVT](#) unit to ensure camshaft stability during the next engine start-up.

Component Description

Engine Structure

E71998

ItemDescription

1	Cylinder head (2 off)
2	Cylinder block
3	Bedplate
4	Structural sump

Cylinder Block Components

The cylinder block is of a cast aluminum alloy construction with cast iron liners. The 90 degree 'V' configuration provides a rigid structure with good vibration levels. A low volume coolant jacket improves warm-up times and piston noise levels; the longitudinal flow design of the jacket, with a single cylinder head coolant transfer port in each bank, improves rigidity and head gasket sealing. The **RH (right-hand)** cylinder bank is designated as bank 1, and the **LH (left-hand)** as bank 2, viewed from the front of the engine.

Data Locations

E43426

ItemDescription

1 Engine part number

2 Engine data (main bearing diameters, cylinder bore diameters, etc), emissions code and engine number

Engine data is marked at 3 locations, 2 on the cylinder block (shown) and 1 on the engine front cover, which consists of a label displaying the engine number. Component diameters are represented by alpha and numeric codes.

Refer to: [Crankshaft Main Bearing Journal Clearance - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (303-00 Engine System - General Information, General Procedures).

Piston and Connecting Rod Assembly

E43427

The connecting rods are manufactured from sinter-forged steel and have fracture-split bearing caps. The bearing caps are produced by fracturing the opposing sides of the connecting rod at the bearing horizontal center line. As well as being easier to manufacture, when reassembled the fractured surfaces interlock to form a strong seamless joint. The cylinder position is marked on adjoining sides of the joint to identify matching connecting rods and bearing caps. The connecting rod bearings are aluminum/tin split plain bearings.

The pistons are of the open-ended skirt design with a dished crown. Three piston rings, 2 compression and one 3-piece oil control ring, are installed on each piston. Each piston is installed on a piston pin located in a bronze bushing in the connecting rod.

2	Bank 2
3	Piston

The piston grade number is stamped on the crown of the piston and must coincide with that for each cylinder bore. The piston must be assembled in the correct orientation for the designated cylinder bore:

- Bank 1 - piston grade number and the thick flange of the connecting rod must face the front of the engine.
- Bank 2 - piston grade number and the thin flange of the connecting rod must face the front of the engine.

Crankshaft and Structural Sump Components

E43435

ItemDescription

1 Bedplate

2 Main bearings - lower

Crankshaft and Main Bearings

E43436

ItemDescription

1	Crankshaft
2	Thrust washer
3	Thrust washer
4	Main bearings - upper (5 off)

Six counter-balance weights ensure low vibration levels from the 4 throw, 5 bearing crankshaft. Manufactured in cast iron, the crankshaft also has undercut and rolled fillets for improved strength.

The crankshaft rear oil seal is a press fit in the bedplate to cylinder block interface.

The main bearings are aluminum/tin split plain bearings. An oil groove in the upper half of each bearing transfers the oil into the crankshaft for lubrication of the connecting rod bearings. An aluminum/tin thrust washer is installed each side of the top half of the center main bearing.

Bedplate

E43437

The bedplate is a structural casting bolted to the bottom of the cylinder block to retain the crankshaft. The use of a bedplate further improves rigidity. Iron inserts, cast into the main bearing supports of the bedplate, minimize main bearing clearance changes due to heat expansion.

Two hollow dowels align the bedplate with the cylinder block.

Beads of sealant seal the joint between the bedplate and the cylinder block.

Oil Pan

E94455

ItemDescription

1	Oil pan
2	Structural sump

The aluminum alloy structural sump is bolted to the bedplate. A windage tray attached to the underside of the bedplate isolates the oil pan from the disturbed air produced by the rotation of the crankshaft, to prevent oil aeration and improve oil drainage. A rubber plug at the rear of the structural sump seals the port that provides access to the torque converter securing bolts. The engine oil drain plug is located in the pressed steel oil pan, which attaches to the underside of the aluminum alloy structural sump.

A bead of sealant seals the joint between the structural sump and the bedplate.

Oil Pump

E43439

The oil pump is installed on the crankshaft at the front of the engine. The pump outlet port aligns with oil passages in the bedplate (see lubrication section for more information).

Starter Drive Plate

E43440

ItemDescription

- | | |
|---|---------------------|
| 1 | Starter drive plate |
| 2 | Bolts (8 off) |

The starter drive plate is attached to the rear of the crankshaft. A timing disc, for the [CKP \(crankshaft position\)](#) sensor, is spot welded to the front face of the drive plate.

Camshaft Timing Components

E43442

ItemDescription

1	Secondary chain tensioner
2	Secondary chain
3	VVT unit
4	Primary chain
5	Primary chain tensioner

Multiple link primary and single row secondary chains drive the camshafts of each cylinder bank. The primary chains transmit the drive from 2 sprockets on the crankshaft to variable valve timing units on the intake camshafts. The secondary chains transmit the drive from the variable valve-timing units to sprockets on the exhaust camshafts.

A key locates the 2 drive sprockets on the crankshaft. The crankshaft's torsional vibration damper retains the sprockets in

position. The variable valve timing units and the exhaust camshaft sprockets are non-interference, non-keyed fits on their respective camshafts; the drive being transmitted by the face to face friction load produced by the valve timing unit/sprocket securing bolt.

Each chain has a hydraulic tensioner operated by engine oil. The primary chains are lubricated via oil squirt tubes located at the front of the engine block near the crankshaft drive sprockets. A jet of oil from the end of each secondary chain tensioner lubricates the secondary chains. The primary chain tensioners act on pivoting flexible tensioner blades. The secondary chain tensioners act directly on the chains. Guide rails are installed on the drive side of the primary chains.

Variable Valve Timing

E31298

ItemDescription

1	VVT oil control unit
2	VVT oil control solenoid
3	Bush carrier

The [VVT](#) unit is a hydraulic actuator mounted on the end of the intake camshaft, which advances or retards the intake camshaft timing and thereby alters the camshaft to crankshaft phasing. The oil control solenoid, controlled by the [ECM](#), routes oil pressure to either the advance or retard chambers located either side of the 3 vanes interspersed within the machined housing of the unit.

The [VVT](#) unit is driven by the primary chain and rotates relative to the exhaust camshaft sprocket. When the [ECM](#) requests the camshaft timing to advance, the oil control solenoid is energized moving the shuttle valve to the relevant position to allow engine oil pressure, via a filter, into the [VVT](#) unit's advance chambers. When the camshaft timing is requested to retard, the shuttle valve moves position to allow oil pressure to exit the advance chambers, while simultaneously routing the oil pressure into the retard chambers.

Timing Cover

E43443

The aluminum alloy timing cover accommodates the crankshaft front oil seal (a [PTFE \(polytetrafluoroethylene\)](#) lip seal). Silicon rubber in-groove gaskets seal the joint between the timing cover and the front face of the engine.

Cylinder Head Components

E43444

ItemDescription

1	Camshaft bearing cap
2	Tappet
3	Collet
4	Valve spring cap
5	Valve spring
6	Valve stem oil seal
7	Valve
8	intake camshaft

9 Exhaust camshaft

The cylinder heads are unique to each cylinder bank. Deep-seated bolts, to reduce distortion, secure the cylinder heads to the cylinder block. Two hollow dowels align each cylinder head with the cylinder block. The multi-layered steel cylinder head gasket has cylinder specific coolant flow cross-sections for uniform coolant flow.

The 14 mm (0.55 in) spark plugs, 1 per cylinder, locate in recesses down the center line of each cylinder head.

The engine-lifting eyes are bolted to the cylinder heads, 2 on the rear (1 per head) and 1 at the front.

The lightweight valve gear provides good fuel economy and noise levels. Valve head diameters are 31 mm (1.220 in) for the exhaust and 35 mm (1.378 in) for the intake. All valves have 5 mm (0.197 in) diameter stems supported in sintered metal seats and guide inserts. Collets, valve collars and spring seats locate single valve springs on both intake and exhaust valves. Valve stem seals are integrated into the spring seats.

Camshafts

E43446

The camshafts are manufactured in chilled cast iron. Five aluminum alloy caps retain each camshaft. Location numbers, 0 to 4 for the intake camshaft and 5 to 9 for the exhaust camshaft, are marked on the outer faces of the caps.

Sensor Timing Ring

E43447

ItemDescription

- | | |
|---|-----------------|
| 1 | Intake camshaft |
| 2 | Timing ring |

A camshaft position sensor timing ring is located at the rear of both intake camshafts. A flat, machined near the front of each camshaft, enables the camshafts to be locked during the valve timing procedure.

Camshaft Cover

E43445

The camshaft covers are manufactured from thermoplastic. Bank 1 camshaft cover incorporates an outlet for the part load engine breather and the pressure control valve. Bank 2 camshaft cover incorporates an outlet for the full load engine breather and the engine oil filler cap. Identical oil separators are incorporated below the breather outlet in each cover. Refer to: [Engine Emission Control](#) (303-08 Engine Emission Control - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

• NOTE: [LH exhaust manifold](#) shown, [RH exhaust manifold](#) similar.

Exhaust Manifolds

E99693

ItemDescription

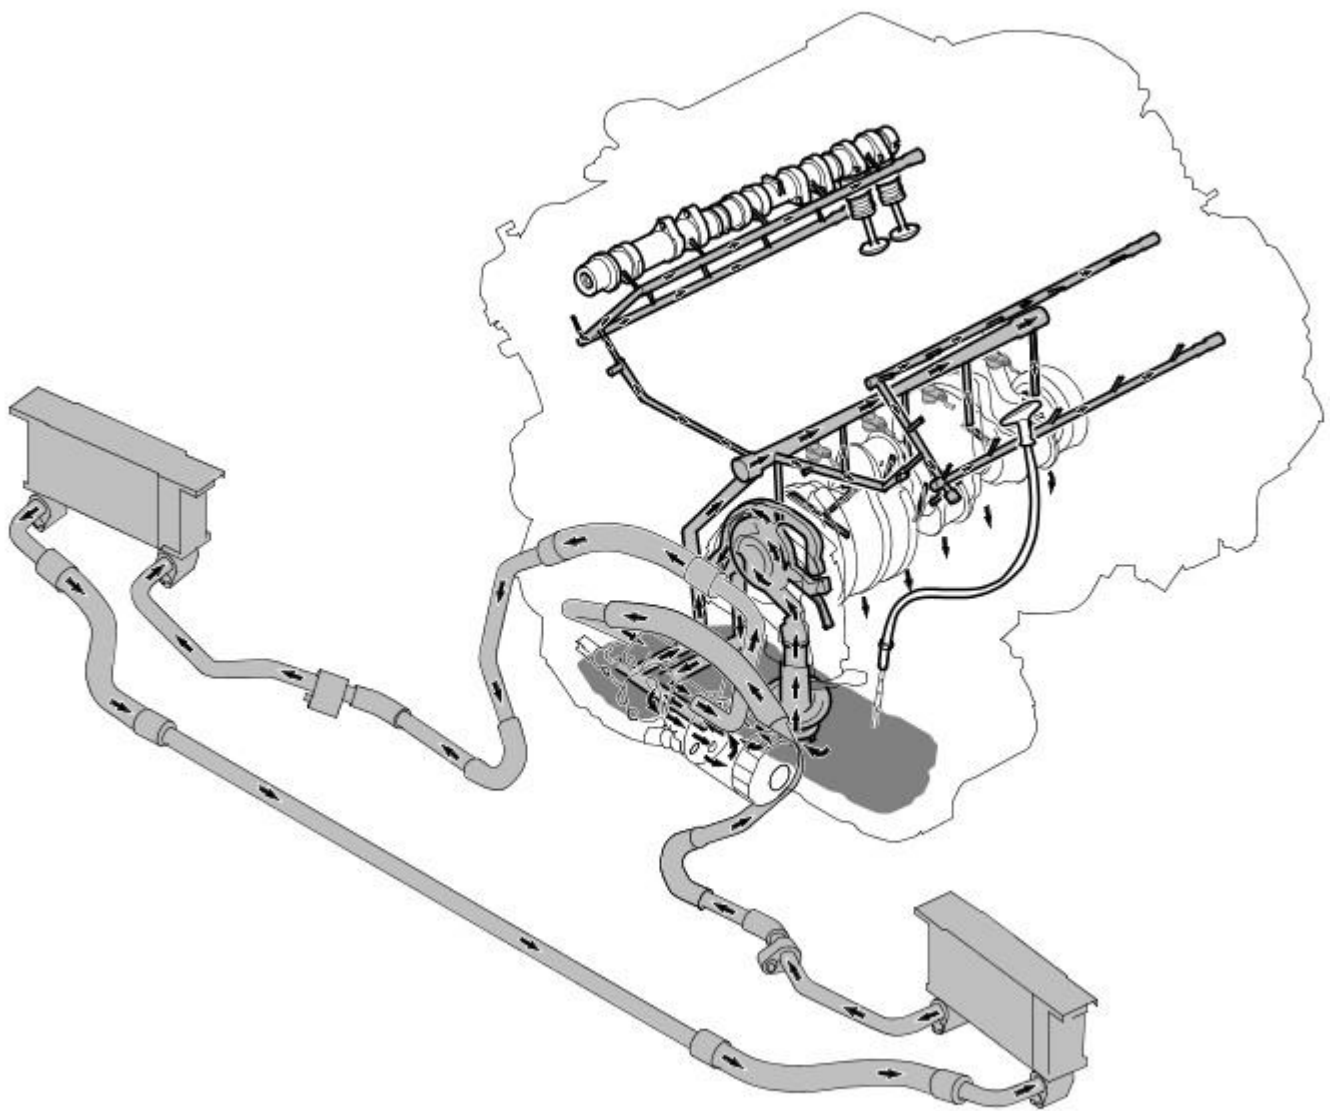

1	Cylinder head
2	Gasket
3	Heat shield
4	Bolt
5	Gasket
6	LH exhaust manifold
7	Spacer (8 off)
8	Bolt (8 off)
9	Bolt (4 off)
10	Heat shield
11	Connector for AIR (secondary air injection) system (where fitted)

The cast stainless steel exhaust manifolds are unique for each cylinder bank. Each exhaust manifold installation includes two metal gaskets and two heat shields. Spacers on the securing bolts allow the manifolds to expand and contract with changes of temperature while maintaining the clamping loads.

Each exhaust manifold incorporates a connector for the [AIR](#) system (where fitted). Where an [AIR](#) system is not fitted, each connector is sealed with a cap nut. The [RH](#) exhaust manifold incorporates a connection flange for the [EGR \(exhaust gas recirculation\)](#) system.

Refer to: [Engine Emission Control](#) (303-08 Engine Emission Control - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

Lubrication System

E 99289

Oil is drawn from the reservoir in the oil pan and pressurized by the oil pump. The output from the oil pump is then filtered, cooled and distributed through internal oil passages.

All moving parts are lubricated by pressure or splash oil. Pressurized oil is also provided for the timing gear chain tensioners and the piston cooling jets.

The oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the quick return of the oil, reducing the volume of oil required and enabling an accurate check of the contents soon after the engine stops.

System replenishment is through the oil filler cap on bank 2 camshaft cover.

Piston Cooling Jets

E56198

ItemDescription

- | | |
|---|----------------------------|
| 1 | Piston cooling jet (4 off) |
| 2 | Bolt (4 off) |

The piston cooling jets lubricate and cool the pistons and piston pins. The jets are located in the cylinder block, one between each adjacent pair of main bearings. Each jet sprays oil on the underside of two pistons.

Oil Pick-up

E72000

The fabricated steel oil pick-up is immersed in the oil reservoir to provide a supply to the oil pump during all normal vehicle attitudes. A mesh screen in the inlet prevents debris from entering the oil system.

Oil Pump

E43456

The oil pump is installed on the crankshaft at the front of the engine. The pump outlet port aligns with oil passages in the bedplate.

The pumping element is an eccentric rotor, which is directly driven by flats on the crankshaft. An integral pressure relief valve regulates pump outlet pressure at 4.5 bar (65.25 lbf/in²).

Oil Filter

E99290

ItemDescription

1	Seal
2	Gasket
3	Filter
4	Oil temperature sensor
5	Bolt (3 off)
6	Oil pressure switch
7	Filter head

The oil filter is a replaceable cartridge with an internal bypass facility that permits full flow bypass if the filter is blocked. The oil filter is installed on a filter head attached to the front of the structural sump. The oil cooler feed and return pipes are connected to the filter head. The filter head also incorporates:

- An oil pressure switch.
Refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation).
- An oil temperature sensor.
Refer to: [Electronic Engine Controls](#) (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

The lubrication system has two engine oil coolers. The engine oil coolers are identical liquid-to-air heat exchangers installed immediately in front of each front wheel arch. Each engine oil cooler is attached to a mounting bracket with bonded rubber mountings.

Engine oil flows through the coolers in series. Pipes and hoses direct the engine oil from the filter head to the [RH](#) engine oil cooler, then to the [LH](#) oil cooler and then back to the filter head.

Cooling air for the oil coolers is taken in through mesh covered openings at the ends of the front bumper. Air ducts connect the openings to the oil coolers. Exhaust air from the oil coolers flows into the front wheel arches through slots in the wheel arch liners.

Oil Level Gage

E95417

ItemDescription

1 Oil level gage

The oil level gage locates along the left side of the oil pan, supported in a tube installed in the bedplate. Two holes in the end of the gage indicate the minimum and maximum oil levels. There is a difference of approximately 1.5 liters (1.58 US quarts) between the 2 levels.

Engine - 4.2L SC V8 - AJV8 - Engine

Diagnosis and Testing

For additional information.

REFER to: [Engine - 3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (303-00 Engine System - General Information, Diagnosis and Testing).

Engine - 4.2L SC V8 - AJV8 - Engine Oil Draining and Filling

General Procedures

Special Tool(s)	
 <p>303-752</p> <p>E75849</p>	<p>Wrench, Oil filter</p> <p>303-752</p>

WARNING: The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

• NOTE: Clean the components general area prior to dismantling.

WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the air deflector.
For additional information, refer to: Air Deflector (501-02, Removal and Installation).

3. Remove the oil pan drain plug.

- Position a container to collect the fluid.
- Discard the oil pan drain plug seal.

4. Remove the oil filter.

- Position a container to collect the fluid.
- Discard the oil filter.

5. Using the special tool, install the oil filter.

6. Tighten the drain plug to 25 Nm.

- Install a new seal.

7. Fill the engine with oil.

8. Start engine and run at idle speed until the oil pressure warning light extinguishes.

- Stop the engine.
- Check for leaks.

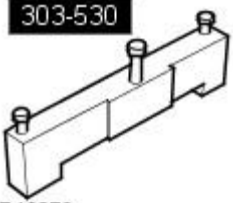

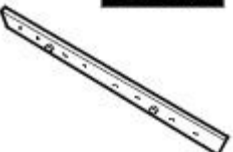

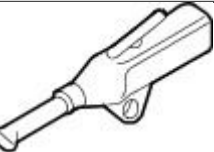

9. Install the air deflector.

For additional information, refer to: Air Deflector (501-02, Removal and Installation).

10. Check and top-up the engine oil.

Engine - 4.2L SC V8 - AJV8 - Camshafts LH

In-vehicle Repair

Special Tool(s)	
 <p>303-530 E46879</p>	<p>Camshaft setting/locking tool 303-530</p>
 <p>303-645 E46881</p>	<p>Timing Setting tool 303-645</p>
 <p>303-532 E46880</p>	<p>Timing chain tensioning tool 303-532</p>
 <p>303-540 E65896</p>	<p>Tappet hold-down tool 303-540</p>
 <p>303-540/02 E65897</p>	<p>Tappet hold-down tool adaptor 303-540/02</p>
 <p>DWST074</p>	<p>Fan nozzle - air gun 303-590</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the engine front cover.
For additional information, refer to: [Engine Front Cover](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).
4. Remove the crankshaft position (CKP) sensor.
For additional information, refer to: [Crankshaft Position \(CKP\) Sensor - Vehicles With: Supercharger](#) (303-14, Removal and Installation).
5. Remove the LH valve cover.
For additional information, refer to: [Valve Cover LH](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

6. CAUTIONS:

 Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

 Rotate the crankshaft clockwise to position the engine to top dead center (TDC) number 1 cylinder.

Lock the crankshaft.

- Install the special tool.
- Install the screw.

7. Remove the RH variable camshaft timing (VCT) control solenoid housing.
 - Remove the 3 bolts.
 - Remove and discard the O-ring seals.

8. Install the special tool to the RH cylinder head.
 - Rotate the crankshaft until the flats on the camshafts are parallel with the cylinder head joint faces.
 - Install the 3 bolts.

VUJ0002400

E46858

E46859

9. Remove the LH primary timing chain tensioner.

- Remove the 2 bolts.

E46861

10. Remove the LH upper and lower primary timing chain tensioner guides.

- Remove the 2 bolts.

E66034

11. Remove the LH primary timing chain.

E46863

12. Release the LH camshaft sprocket assembly.

- Remove the 2 Torx bolts.

E46865

E46864

13. Remove the LH secondary timing chain, tensioner and sprocket assembly.

- Remove the 2 retaining bolts.

E58803

14. Remove the special tool from the LH cylinder head.

- Remove the 3 bolts.

E52849

15.  CAUTION: Evenly and progressively, release the camshaft bearing caps.

- NOTE: Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).

Remove the camshaft bearing caps.

- Remove the 20 bolts.

E46868

16. Remove the camshafts.

Installation

E46868

1. Install the camshafts.

- Clean the component mating faces.
- Replace the valve shims, with the smallest shim available.
- Lubricate the journals and camshaft lobes.

E52849

2. Install the camshaft bearing caps.

- Clean the component mating faces.
- Evenly and progressively tighten the bolts in the sequence shown to 10 Nm.

E58803

3. Install the special tool to the LH cylinder head.

- Install the 3 bolts.

E66035

4.  CAUTION: Make sure the secondary timing chain and camshaft sprockets are free to rotate.

- NOTE: LH illustration shown, RH is similar.

Install the LH secondary timing chain, tensioner and sprocket assembly.

- Clean the components.
- Install the Torx bolts, but do not tighten fully at this stage.

5. Install the LH secondary timing chain tensioner retaining bolts.

- Tighten the bolts to 12 Nm.

E46865

6. Install the LH primary timing chain.

- Clean the components.
- Make sure the timing chain slack is on the tensioner side of the timing chain.

E46863

7. Install the LH primary timing chain tensioner guides.

- Tighten the bolts to 12 Nm.

E66034

8.  CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the LH primary timing chain tensioner.

- Clean the components.
- Using 3 mm diameter metal rod, retain the chain tensioner piston.
- Remove the retaining rod.
- Tighten the bolts to 12 Nm.

E46871

E46870

9. CAUTIONS:

 Using the special tool, apply force to the tool in a counter-clockwise direction, to tension the primary timing chain on its drive side.

 The intake camshaft sprocket retaining bolt **MUST** be tightened before the exhaust camshaft sprocket retaining bolt. Engine damage will occur if this procedure is not followed.

Install the special tool to the RH exhaust camshaft sprocket.

- Tighten the intake camshaft sprocket retaining bolt to 20 Nm + 90 degrees
- Tighten the exhaust camshaft retaining bolt to 20 Nm + 90 degrees.
- Install new retaining bolts.

10. Install the LH VCT control solenoid housing.

- Clean the components.
- Install the new O-ring seals.
- Tighten the new bolts to 22 Nm.

E46858

11. Remove the special tool from the LH cylinder head.

E46859

12. Remove the crankshaft locking tool.

- Remove the screw.

VUJ0002400

13. Install the CKP sensor.

For additional information, refer to: Crankshaft Position (CKP) Sensor - Vehicles With: Supercharger (303-14, Removal and Installation).

14. For cylinder head data, refer to specifications.

15. Rotate the engine clockwise to position the camshaft lobe away from the valve tappet.

16.  CAUTION: Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.

17. Repeat the above procedure for the remaining 15 shims.

18. Install the special tool 303-540, to the cylinder head.

- Tighten the 2 bolts to 10 Nm

19.  CAUTION: Do not rotate the crankshaft while the special tool 303-540/02 is attached to 303-540.

Attach the special tool 303-540/02 to 303-540.

- Secure with the 2 wing nuts.

20. Position the special tool to the tappet as shown.

21. Using the special tool, compress the valve spring.

22.  **CAUTION:** Do not use a magnet to remove shims. Failure to follow these instructions may result in damage to the vehicle.

• **NOTE:** Use the following formula to calculate the required shim thickness. Original shim thickness + measured shim clearance - desired clearance = required shim thickness.

Remove, clean and measure the shim.

- Surround the immediate working area with a cloth, to retain any loose shims displaced by the compressed air.
- Use the special tool 303-590, aimed at the edge of the shim, to lift it from the tappet. Note the position of each one.

23. **CAUTIONS:**

 Shims must be fitted with the size markings facing the tappet, not the camshaft.

 Do not use a magnet to install shims. Failure to follow these instructions may result in damage to the vehicle.

Install the new shim.

- Clean the components.
- Lubricate the shim with clean engine oil.
- Release and remove the special tools as required.

24. Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.

25. Repeat the above procedure for the remaining valves.

26. Install the LH valve cover.

For additional information, refer to: [Valve Cover LH](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

27. Install the engine front cover.

For additional information, refer to: [Engine Front Cover](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

28. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L SC V8 - AJV8 - Crankshaft Front Seal

In-vehicle Repair

Removal

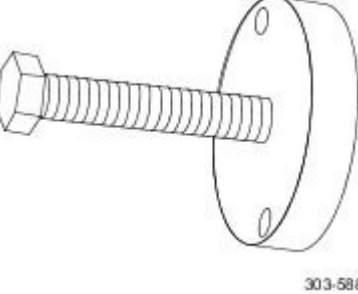

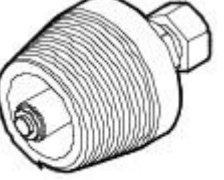

1. Remove the crankshaft pulley.
For additional information, refer to: [Crankshaft Pulley](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

Installation

1. Install the crankshaft pulley.
For additional information, refer to: [Crankshaft Pulley](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

Engine - 4.2L SC V8 - AJV8 - Crankshaft Pulley

In-vehicle Repair

Special Tool(s)

 303-191-02	Crankshaft pulley locking tool adapter 303-191/02
 303-588	Crankshaft pulley/damper remover 303-588
 303-751	Seal extractor 303-751
 303-750	Seal installer 303-750

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the cooling fan motor and shroud.
For additional information, refer to: [Cooling Fan Motor and Shroud - 4.2L SC V8 - AJV8](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
4. Remove the oil filter housing.
For additional information, refer to: [Oil Filter Housing](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

5. Release the accessory drive belt.

- Rotate the accessory drive belt tensioner counter-clockwise, using a 3/8 " drive wrench.

6.  CAUTION: Under no circumstances should the crankshaft setting peg, 303-645, be used in the following operations, to restrain the crankshaft.

- NOTE: The crankshaft pulley retaining bolt will be very tight.

Using the special tool, retain the crankshaft front pulley.

- Remove and discard the crankshaft pulley retaining bolt.
- Remove the special tools.

7. Using the special tools, remove the crankshaft pulley.

- Collect the locking ring.
- Remove the special tools.

8. Check the crankshaft pulley and locking ring for damage.

9. Using the special tool, remove the crankshaft front seal.

E31171

Installation

1. CAUTIONS:

Make sure the crankshaft seal mating faces are clean and dry.

Do not remove the seal protector at this stage.

Using the special tool, install the crankshaft front seal.

- Clean the component mating faces.

2. Remove the seal protector.

E31173

3. Install the crankshaft pulley.

- Lubricate the seal with clean engine oil.
- Install the locking ring.

4. CAUTION: The screw thread in the crankshaft pulley must be cleaned out before installing a new crankshaft pulley bolt.

Install, but do not tighten, the new crankshaft pulley bolt.

5. CAUTION: Under no circumstances should the crankshaft setting peg, 303-645, be used in the following operations, to restrain the crankshaft.

Using the special tools, retain the crankshaft pulley.

- Tighten the crankshaft pulley bolt to 380 Nm.
- Remove the special tools.

6. Attach the accessory drive belt.

7. Install the oil filter housing.

For additional information, refer to: [Oil Filter Housing](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

8. Install the cooling fan motor and shroud.

For additional information, refer to: [Cooling Fan Motor and Shroud - 4.2L SC V8 - AJV8](#) (303-03A Engine Cooling - 4.2L NA

V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

9. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L SC V8 - AJV8 - Crankshaft Rear Seal

In-vehicle Repair

Special Tool(s)	
 <p>303-538</p> <p>E46616</p>	Crankshaft rear oil seal remover/installer
	303-538

Removal

-  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

- Remove the flexplate.
- Install the special tools.

- Install the 2 bolts.
- Tighten the 2 nuts to retain the special tool.

E46613

- Using the special tool, pierce the seal to create holes for the 6 self-tapping screws.

E46614

5. Using the special tools, remove and discard the crankshaft rear oil seal.

- Install the 6 self-tapping screws.
- Adjust the 2 nuts.
- Tighten the center bolt.

E46615

Installation

1.  **CAUTION:** Do not lubricate the components.

Partially install the crankshaft rear oil seal.

- Make sure the components are clean and dry.
- Carefully remove the transit sleeve, leaving the seal on the crankshaft.

2. Install the special tools.

- Install the 2 bolts.
- Tighten the 2 nuts to retain the special tool.

E46613

3. Using the special tool, install the crankshaft rear oil seal.

- Tighten the special tool nuts evenly and progressively to fully install the seal.

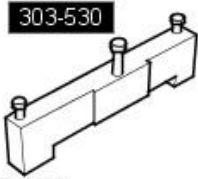

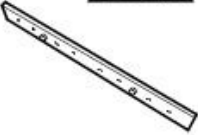

E46613

4. Install the flexplate.

5. Check and top-up the engine oil.

Engine - 4.2L SC V8 - AJV8 - Cylinder Head LH

In-vehicle Repair

Special Tool(s)	
 <p>303-530 E46879</p>	Camshaft setting/locking tool 303-530
 <p>303-540 E65896</p>	Tappet hold-down tool 303-540
 <p>303-540/02 E65897</p>	Tappet hold-down tool adaptor 303-540/02

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the fuel injection supply manifold.
For additional information, refer to: [Fuel Rail](#) (303-04B Fuel Charging and Controls - 4.2L SC V8 - AJV8, Removal and Installation).
4.  **CAUTION:** Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the LH charge air cooler adaptor assembly.
 - Remove the 5 bolts.
 - Discard the gasket.
5. Remove the timing drive components.
For additional information, refer to: [Timing Drive Components](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).
6. Remove the special tool from the LH cylinder head.
7.  **CAUTION:** Evenly and progressively, release the camshaft bearing caps.
 - **NOTE:** Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).
 Remove the camshaft bearing caps.
 - Remove the 20 bolts.

8. Remove the camshafts.

9. NOTE: Note the fitted position.

• NOTE: Make sure the shim remains with the tappet.

Remove the 16 tappets.

10. Remove the CMP sensor.

- Remove the Torx bolt.
- Remove and discard the O-ring seal.

11. Release the LH catalytic converter.

- Remove and discard the 2 nuts.

E46853

12. CAUTIONS:

 The bolts can only be used twice, mark the bolts with a center punch. If two punch marks are visible, discard the bolts.

 Vehicles fitted with Polydrive cylinder head bolts, the cylinder head bolts must be removed using a 10 mm Polydrive socket or a 10 mm Allen key. Failure to follow this instruction may result in damage to the component.

• **NOTE:** Remove the bolts in the indicated sequence.

Remove the 12 cylinder head bolts.

E46854

13.  CAUTION: The cylinder head must not be placed mating face down. Failure to follow this instruction may result in damage to the vehicle.

With assistance remove the cylinder head.

14. Remove and discard the cylinder head gasket.

- Clean the cylinder head locating dowels.
- Clean and inspect the cylinder head and cylinder block.

E67600

15. NOTE: Do not disassemble further if the component is removed for access only.

Remove the LH heat shield.

- Remove the 4 screws.

E67601

16. NOTE: Do not disassemble further if the component is removed for access only.

Remove the exhaust manifold.

- Remove and discard the 8 bolts.
- Remove the 8 spacers.

17. Remove and discard the exhaust manifold gasket.

- Remove the bolt.

E67602

Installation

1. Clean the component mating faces.
2. Check cylinder head face for distortion, across the center and from corner to corner.

E46855

3. For cylinder head face distortion data, refer to specifications. For additional information, refer to: [Specifications](#) (303-01B Engine - 4.2L SC V8 - AJV8, Specifications).

4. NOTE: For cylinder head with distortion above the maximum allowance, the cylinder head material must be measured.

Measure the cylinder head material.

- Check measurement from the centre of the exhaust dowel to the cylinder head face as shown.
- If the measurement is less than 51.88 mm the cylinder head requires replacement.

E100333

5. Install the exhaust manifold gasket.

- Clean the component mating faces.
- Tighten the bolt to 50 Nm (37 lb.ft).

6. Install the exhaust manifold.

- Clean the component mating faces.
- Install the spacers.
- Evenly and progressively, tighten the new bolts in the sequence shown, to 24 Nm (18 lb.ft).

E65731

7. Install the heat shield.

- Tighten the screws.

8.  CAUTION: The head gasket must be installed over the cylinder block dowels.

Install a new cylinder head gasket.

9. With assistance install the cylinder head.

10. NOTE: Tighten the bolts 1 to 10 in the sequence shown.

Install the cylinder head bolts.

- Lubricate the new cylinder head bolt threads with clean engine oil.
- Tighten the bolts 1 to 10 to 20 Nm (15 lb.ft).
- Tighten the bolts 1 to 10 to 35 Nm (26 lb.ft).
- Tighten the bolts 1 to 10, a further 90 degrees.
- Tighten the bolts 1 to 10, a further 90 degrees.
- Tighten the M8 bolts 11 and 12, to 25 Nm (18 lb.ft).

E46856

11. Attach the catalytic converter.

- Tighten the nuts to 40Nm (30 lb.ft).

12. Install the CMP sensor.

- Clean the components.
- Install a new O-ring seal.
- Tighten the Torx bolt to 7 Nm (5 lb.ft).

13. Install the tappets.

- Clean the components.
- Lubricate the components with clean engine oil.

14. Install the camshafts.

- Clean the component mating faces.
- Lubricate the journals and camshaft lobes with clean engine oil.

15. Install the camshaft bearing caps.

- Clean the component mating faces.
- Evenly and progressively tighten the bolts in the sequence shown to 10 Nm (7 lb.ft).

E48365

E58803

16. NOTE: RH illustration shown, LH is similar.

Install the special tool to the LH cylinder head.

- Install the 3 bolts.

17. NOTE: Do not install the LH valve cover until valve clearance adjustment has been completed.

Install the timing drive components.

For additional information, refer to: [Timing Drive Components](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

18. Install the charge air cooler adaptor assembly.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 25 Nm (18 lb.ft).

19. Install the fuel injection supply manifold.

For additional information, refer to: [Fuel Rail](#) (303-04B Fuel Charging and Controls - 4.2L SC V8 - AJV8, Removal and Installation).

20. Rotate the engine clockwise to position the camshaft lobe away from the valve tappet.

21.  CAUTION: Camshaft lobes must be 180 degrees away from each valve tappet or valve clearance will be incorrect.

Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.

E46876

22. Repeat the above procedure for the remaining 15 shims.

23. Install the special tool 303-540, to the cylinder head.

- Tighten the 2 bolts to 10 Nm (7 lb.ft).

E65899

24.  CAUTION: Do not rotate the crankshaft while the special tool 303-540/02 is attached to 303-540.

Attach the special tool 303-540/02 to 303-540.

- Secure with the 2 wing nuts.

25. Position the special tool to the tappet as shown.

26. Using the special tool, compress the valve spring.

27.  CAUTION: Do not use a magnet to remove shims. Failure to follow these instructions may result in damage to the vehicle.

• NOTE: Use the following formula to calculate the required shim thickness.
 $\text{Original shim thickness} + \text{measured shim clearance} - \text{desired clearance} = \text{required shim thickness}$.

Remove, clean and measure the shim.

- Surround the immediate working area with a cloth, to retain any loose shims displaced by the compressed air.
- Use the special tool 303-590, aimed at the edge of the shim, to lift it from the tappet. Note the position of each one.

28. CAUTIONS:

 Shims must be fitted with the size markings facing the tappet, not the camshaft.

 Do not use a magnet to install shims. Failure to follow these instructions may result in damage to the vehicle.

Install the new shim.

- Clean the components.
- Lubricate the shim with clean engine oil.
- Release and remove the special tools as required.

29. Using the feeler gauge set, measure the clearance between the camshaft and the valve shim.

30. Repeat the above procedure for the remaining valves.

31. Connect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L SC V8 - AJV8 - Engine Front Cover

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Recover the A/C refrigerant.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
3.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Disconnect the engine oil temperature sensor electrical connector.

5. Disconnect the engine oil pressure (EOP) sensor electrical connector.

6. Detach the oil filter housing.
 - Remove the 3 bolts.
 - Remove and discard the O-ring seal.

7. Remove the cooling fan and shroud.
For additional information, refer to: [Cooling Fan Motor and Shroud - 4.2L SC V8 - AJV8](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

8. Remove the thermostat housing.
For additional information, refer to: [Thermostat Housing - 4.2L SC V8 - AJV8](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
9. Remove the secondary air injection (AIR) tube.
For additional information, refer to: [Secondary Air Injection \(AIR\) Control Valve to Exhaust Manifold Tube](#) (303-08 Engine Emission Control - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
10. Release the radiator lower hose.

- Release the clip.

11. **NOTE:** Restrain the pulley to aid the removal of the bolts.

Remove the coolant pump pulley.

- Remove the 3 bolts.

12. Remove the power steering pump.
For additional information, refer to: [Power Steering Pump - 4.2L NA V8 - AJV8](#) (211-02 Power Steering, Removal and Installation).
13. Remove the LH valve cover.
For additional information, refer to: [Valve Cover LH](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).
14. Remove the RH valve cover.
For additional information, refer to: [Valve Cover RH](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).
15. Remove the crankshaft pulley.
For additional information, refer to: [Crankshaft Pulley](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

16. Remove the accessory drive belt idler pulley.

- Remove the bolt.

17. Remove the accessory drive belt tensioner.

- Remove the bolt.

18.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Disconnect the refrigerant lines from the A/C compressor.

- Remove the 2 bolts.
- Remove and discard the 2 O-ring seals.

19. Position the A/C compressor aside to access the A/C compressor mounting bracket.

20. Remove the A/C compressor mounting bracket.

- Remove the 4 bolts.

21. Remove the power steering pump mounting bracket.

- Remove the 4 bolts.

22. LH side: Release the wiring harness.

- Release the 2 clips.

23. Remove the engine front cover.

- Remove the 24 bolts.
- Remove and discard the 2 gaskets.
- Remove and discard the 3 O-ring seals.

VUJ0002018

Installation

1. To install, reverse the removal procedure.

- Apply a bead of sealant 3 mm diameter, by 12 mm long, to the 8 places indicated.

E47100

2. Tighten to 12 Nm.

E31273

3. Tighten to 25 Nm

E99246

4. Tighten to 25 Nm

5. Tighten to 20 Nm.

6. Tighten to 10 Nm.

7. Tighten to 9 Nm.

E97758

8. Tighten to 45 Nm.

E65905

9. Tighten to 45 Nm.

E65904

Engine - 4.2L SC V8 - AJV8 - Engine Mount LH

In-vehicle Repair

Removal

All vehicles

1. Remove the cover and disconnect the battery ground cable.
For additional information, refer to: Specifications (414-01, Specifications).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the LH front wheel and tire.
For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).
4. Remove the air deflector.
For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

Left-hand drive vehicles

5. **NOTE:** Note the fitted position.

Remove the steering gear flexible coupling.

- Remove and discard the 2 bolts.

E62470

6. Release the steering gear.

- Remove the 3 bolts.

E62472

All vehicles

7. Release the engine mount.

- Support the engine.
- Remove and discard the nut.

8. Remove the engine mount and bracket.

- Raise the engine.
- Remove the 4 bolts.

9. NOTE: Do not disassemble further if the component is removed for access only.

Remove the engine mount.

- Remove and discard the nut.

Installation

All vehicles

1. Install the engine mount.

- Tighten the new nut to 55 Nm (41 lb.ft).

2. Install the engine mount and bracket.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).
- Lower the engine.
- Tighten the new nut to 63 Nm (46 lb.ft).

Left-hand drive vehicles

3. Secure the steering gear.

- Tighten the bolts to 100 Nm (74 lb.ft).

4. Install the steering gear flexible coupling.

- Tighten the new bolts to 35 Nm (26lb.ft).

All vehicles

5. Install the air deflector.

For additional information, refer to: Air Deflector (501-02 Front End Body Panels, Removal and Installation).

6. Install the front wheel.

For additional information, refer to: Wheel and Tire (204-04 Wheels and Tires, Removal and Installation).

7. Connect the battery ground cable and install the cover.

For additional information, refer to: Specifications (414-01, Specifications).

Engine - 4.2L SC V8 - AJV8 - Engine Mount RH

In-vehicle Repair

Removal

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

Right-hand drive vehicles

4. **NOTE:** Note the fitted position.

Release the universal joint from the steering gear.

VUJ0005119

5. Disconnect the power steering control valve actuator electrical connector.

E62469

6. **NOTE:** Left-hand shown, right-hand similar.

Release the steering gear.

- Remove the 3 bolts.

VUJ0005142

7. Support the steering gear.

E 31035

All vehicles

8. Release the engine mount.

- Support the engine.
- Remove and discard the nut.

E62721

9. Remove the engine mount and bracket.

- Raise the engine.
- Remove the 4 bolts.

E98556

10. NOTE: Do not disassemble further if the component is removed for access only.

Remove the engine mount.

- Remove and discard the nut.

E62723

Installation

All vehicles

1. To install, reverse the removal procedure.

All vehicles

2. Tighten to 55 Nm.

3. Tighten to 47 Nm.

4. Tighten to 63 Nm.

5. Tighten to 100 Nm.

6. Tighten to 35 Nm.

VUJ0005119

Engine - 4.2L SC V8 - AJV8 - Exhaust Manifold LH

In-vehicle Repair

Removal

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Release the coolant expansion tank for access.

- Remove the retaining nut and bolt.
- Remove the clip.
- Position the coolant expansion tank aside.

4. Release and tip aside the power steering reservoir.

- Remove the nut.
- Discard the O-ring seal.

6. Remove the LH exhaust manifold heat shield retaining bolts.

7.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise the vehicle.

8. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).
9. Remove the LH catalytic converter.
For additional information, refer to: [Catalytic Converter](#) (309-00, Removal and Installation).

Left-hand drive vehicles

10. Disconnect the steering column lower shaft from the steering gear.

- Remove the steering column flexible coupling securing bolts.

11. Disconnect the steering gear control valve actuator electrical connector.

12. Detach the steering gear.

- Remove the steering gear retaining bolts.

13. Using suitable tie strap(s), secure the steering gear.

All vehicles

14. Remove the splash shield retaining clips.

- Position the splash shield to one side.

15. Remove the LH exhaust manifold heat shield retaining bolts.

- Remove the LH exhaust manifold heat shield.

Vehicles with secondary air injection (AIR)

16. Detach the secondary air injection (AIR) control valve to exhaust manifold tube from the exhaust manifold.

All vehicles

17. Remove the exhaust manifold.

- Remove and discard the 8 bolts.
- Remove the 8 spacers.

18. Remove and discard the LH exhaust manifold gasket.

- Remove the bolt.

Installation

All vehicles

1. Install the LH exhaust manifold gasket.

- Clean the component mating faces.
- Tighten the bolt to 50 Nm.

2. Install the LH exhaust manifold.

- Clean the component mating faces.
- Install the spacers.
- Evenly and progressively, tighten the new bolts in the sequence shown, to 24 Nm.

E65731

Vehicles with secondary air injection (AIR)

3. Attach the AIR control valve to exhaust manifold tube to the exhaust manifold.

- Tighten to 35 Nm.

All vehicles

4. Install the LH exhaust manifold heat shield.

- Tighten the bolts to 8 Nm.

Left-hand drive vehicles

5. Install the steering gear.

- Tighten the bolts to 100 Nm.

6. Connect the lower steering column shaft to the steering gear.

- Tighten the bolts to 35 Nm.

7. Connect the steering gear control valve actuator electrical connector.

All vehicles

8. Install the splash shield.

- Install the 2 clips.

9. Install the LH catalytic converter.

For additional information, refer to: Catalytic Converter (309-00, Removal and Installation).

10. Install the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).

11. Lower the vehicle.

12. Install the LH exhaust manifold heat shield retaining bolts.

- Tighten the bolts to 8 Nm.

13. With assistance, install the oil level indicator and tube.

- Clean the components.
- Install a new O-ring seal.
- Lubricate the O-ring seal with clean engine oil.
- Tighten the nut to 6 Nm.

14. Install the power steering fluid reservoir.

15. Attach the coolant expansion tank.

- Reposition the coolant expansion tank.
- Tighten the nut and bolt to 10 Nm.
- Install the clip.

16. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L SC V8 - AJV8 - Flexplate

In-vehicle Repair

Removal

1. Remove the transmission.
For additional information, refer to: [Transmission - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (307-01 Automatic Transmission/Transaxle - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. **NOTE:** Prevent the flexplate from rotating.

Remove the flexplate.

- Remove the 8 bolts.

E46527

Installation

1.  **CAUTION:** Make sure that the locating pin on the crankshaft is aligned with the guide hole in the flexplate.

To install, reverse the removal procedure.

- Tighten the bolts in the sequence shown in two stages.
- Tighten to 15 Nm.
- Tighten to 110 Nm.

E53833

Engine - 4.2L SC V8 - AJV8 - Oil Filter Housing

In-vehicle Repair

Special Tool(s)	
 <p>303-752</p> <p>E75849</p>	<p>Wrench, Oil filter</p> <p>303-752</p>

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Battery Disconnect and Connect (414-01, General Procedures).

2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the air deflector.
For additional information, refer to: Air Deflector (501-02, Removal and Installation).
4. Disconnect the engine oil temperature sensor electrical connector.

5. Disconnect the engine oil pressure (EOP) sensor electrical connector.

6. NOTE: Some oil spillage is inevitable during this operation.

- NOTE: Clean the components general area prior to dismantling.

Remove the oil filter.

- Position a container to collect the fluid.

7. Detach the oil cooler housing from the oil filter housing.

8. Remove the oil filter housing.

- Remove the 3 bolts.
- Remove and discard the O-ring seal.

9. NOTE: Do not disassemble further if the component is removed for access only.

Remove the engine oil temperature sensor.

10. Remove the EOP sensor.

Installation

1. Install the EOP sensor.

- Clean the components.
- Apply sealant of the correct specification to the sensor thread.
- Tighten to 15 Nm.

2. Install the engine oil temperature sensor.

- Clean the components.
- Apply sealant of the correct specification to the sensor thread.
- Tighten to 15 Nm.

3. Install the oil filter housing.

- Clean the component mating faces.
- Install a new O-ring seal.
- Tighten the bolts to 20 Nm.

4. Connect the engine oil cooler lines.

- Clean the component mating faces.
- Install new O-ring seals.
- Tighten to 7 Nm.

5. Using the special tool, install the oil filter.

- Lubricate the oil filter seal with clean engine oil and tighten to 18 Nm .

- 6.** Connect the EOP sensor electrical connector.
- 7.** Connect the engine oil temperature sensor electrical connector.
- 8.** Install the air deflector.
For additional information, refer to: Air Deflector (501-02, Removal and Installation).
- 9.** Connect the battery ground cable.
For additional information, refer to: Battery Disconnect and Connect (414-01, General Procedures).
- 10.** Check and top-up the engine oil.

Engine - 4.2L SC V8 - AJV8 - Oil Pan

In-vehicle Repair

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the air deflector.
For additional information, refer to: [Air Deflector](#) (501-02 Front End Body Panels, Removal and Installation).
3. Drain the engine oil.
For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01B Engine - 4.2L SC V8 - AJV8, General Procedures).

4. Remove the oil pan.

- Remove the 17 bolts.
- Remove and discard the gasket.

E31186

Installation

1. To install, reverse the removal procedure.

- Tighten to 12 Nm.

E36705

Engine - 4.2L SC V8 - AJV8 - Oil Pump

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the timing drive components.
For additional information, refer to: [Timing Drive Components](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).
4. Remove the oil pan.
For additional information, refer to: [Oil Pan](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).
5. **NOTE:** The bolts will remain captive.

Remove the oil strainer pick-up assembly.

- Remove the 2 bolts.
- Remove and discard the O-ring seal.

E36704

6. Remove the oil pump assembly.

- Remove the 4 bolts.
- Remove and discard the O-ring seal.

E61762

Installation

1. Install the oil pump assembly.

- Clean the components mating faces.
- Install a new O-ring seal.
- Tighten the bolts to 12 Nm.

E61762

E36704

2. Install the oil strainer pick-up assembly.

- Install a new O-ring seal.
- Tighten the bolts to 12 Nm.

3. Install the oil pan.

For additional information, refer to: [Oil Pan](#) (303-01A Engine - 4.2L NA V8 - AJV8, In-vehicle Repair).

4. Install the timing drive components.

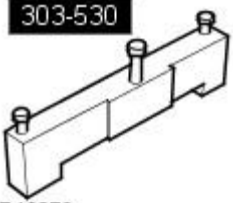

For additional information, refer to: [Timing Drive Components](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

5. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L SC V8 - AJV8 - Timing Drive Components

In-vehicle Repair

Special Tool(s)	
 <p>303-530 E46879</p>	<p>Camshaft setting/locking tool 303-530</p>
 <p>303-645 E46881</p>	<p>Timing Setting tool 303-645</p>
 <p>303-532 E46880</p>	<p>Timing chain tensioning tool 303-532</p>

Removal

• NOTE: This procedure covers the removal and installation of the following components: timing chains, chain guides, tensioners and sprockets.

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the engine front cover.
For additional information, refer to: [Engine Front Cover](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).
4. Remove both the crankshaft position (CKP) sensors.
For additional information, refer to: [Crankshaft Position \(CKP\) Sensor - 4.2L NA V8 - AJV8](#) (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

5. CAUTIONS:

 Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

 Rotate the crankshaft clockwise to position the engine to top dead center (TDC) number 1 cylinder.

Lock the crankshaft.

- Install the special tool.
- Install the screw.

VUJ0002400

E46858

6. Remove the RH variable camshaft timing (VCT) control solenoid housing.

- Remove the 3 bolts.
- Remove and discard the O-ring seals.

E46859

7. Install the special tool to the RH cylinder head.

- Rotate the crankshaft until the flats on the camshafts are parallel with the cylinder head joint faces.
- Install the 3 bolts.

E46861

8. Remove the RH primary timing chain tensioner.

- Remove the 2 bolts.

E66034

9. Remove the RH upper and lower primary timing chain tensioner guides.

- Remove the 2 bolts.

10. Remove the RH primary timing chain.

E46863

11. Remove the LH variable camshaft timing (VCT) control solenoid housing.

- Remove the 2 bolts.
- Remove the nut.
- Remove and discard the O-ring seals.

E48360

12. Install the special tool to the LH cylinder head.

- Install the 3 bolts.

E46860

13. Remove the LH primary timing chain tensioner.

- Remove the 2 bolts.

E48361

14. Remove the LH upper and lower primary timing chain tensioner guides.

- Remove the 2 bolts.

E48362

15. Remove the LH primary timing chain.

E30710

16. Release the LH camshaft sprocket assembly.

- Remove the 2 Torx bolts.

E48363

17. Remove the LH secondary timing chain, tensioner and sprocket assembly.

- Remove the 2 bolts.

E48364

18. Release the RH camshaft sprocket assembly.

- Remove the 2 Torx bolts.

19. Remove the RH secondary timing chain, tensioner and sprocket assembly.

- Remove the 2 retaining bolts.

20. NOTE: Note the orientation of the crankshaft sprocket.

Remove the crankshaft sprocket.

- Remove the crankshaft sprocket key.

Installation

1. Install the crankshaft sprocket.

- Clean the components.
- Install the crankshaft sprocket key.

2.  **CAUTION:** Make sure the secondary timing chain and camshaft sprockets are free to rotate.

• **NOTE:** LH illustration shown, RH is similar.

Install the LH secondary timing chain, tensioner and sprocket assembly.

- Clean the components.
- Install the Torx bolts, but do not tighten fully at this stage.

3. Install the special tool to the exhaust camshaft sprocket.

- Reposition the camshaft sprockets for the most advantageous position for use of the special tool.

4. Install the LH secondary timing chain tensioner retaining bolts.

- Tighten to 12 Nm.

5. Install the LH primary timing chain.

- Clean the components.
- Make sure the timing chain slack is on the tensioner side of the timing chain.

6. Install the LH primary timing chain tensioner guides.

- Clean the components.
- Tighten to 12 Nm.

7. **!** CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

• NOTE: LH illustration shown, RH is similar.

Install the LH primary timing chain tensioner.

- Clean the components.
- Using 3 mm diameter metal rod, retain the chain tensioner piston.
- Remove the retaining rod.
- Tighten to 12 Nm.

8. CAUTIONS:

! Using the special tool, apply force to the tool in a counter-clockwise direction, to tension the primary timing chain on its drive side.

! The intake camshaft sprocket retaining bolt **MUST** be tightened before the exhaust camshaft sprocket retaining bolt. Engine damage will occur if this procedure is not followed.

Install the special tool to the LH exhaust camshaft sprocket.

- Tighten the intake camshaft sprocket retaining bolt to 20 Nm + 90 degrees
- Tighten the exhaust camshaft retaining bolt to 20 Nm + 90 degrees.
- Install new retaining bolts.

9. Install the LH VCT control solenoid housing.

- Clean the components.
- Install the new O-ring seals.
- Tighten the new bolts to 22 Nm.
- Tighten the nut to 10 Nm.

E46863

10.  **CAUTION:** Make sure the secondary timing chain and camshaft sprockets are free to rotate.

Install the RH secondary timing chain, tensioner and sprocket assembly.

- Clean the components.
- Install the Torx bolts, but do not tighten fully at this stage.

E66034

11. Install the RH secondary timing chain tensioner retaining bolts.

- Tighten the bolts to 12 Nm.

E46863

12. Install the RH primary timing chain.

- Clean the components.
- Make sure the timing chain slack is on the tensioner side of the timing chain.

E66034

13. Install the RH primary timing chain tensioner guides.

- Tighten the bolts to 12 Nm.

E46861

14.  **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the RH primary timing chain tensioner.

- Clean the components.
- Using 3 mm diameter metal rod, retain the chain tensioner piston.
- Remove the retaining rod.
- Tighten the bolts to 12 Nm.

E46870

15. **CAUTIONS:**

 Using the special tool, apply force to the tool in a counter-clockwise direction, to tension the primary timing chain on its drive side.

 The intake camshaft sprocket retaining bolt **MUST** be tightened before the exhaust camshaft sprocket retaining bolt. Engine damage will occur if this procedure is not followed.

Install the special tool to the RH exhaust camshaft sprocket.

- Tighten the intake camshaft sprocket retaining bolt to 20 Nm + 90 degrees
- Tighten the exhaust camshaft retaining bolt to 20 Nm + 90 degrees.
- Install new retaining bolts.

E46858

16. Install the RH VCT control solenoid housing.

- Clean the components.
- Install the new O-ring seals.
- Tighten the new bolts to 22 Nm.

VUJ0002400

17. Remove the special tool from the RH cylinder head.

- Remove the 3 bolts.

18. Remove the special tool from the LH cylinder head.

- Remove the 3 bolts.

19. Install the engine front cover.

For additional information, refer to: [Engine Front Cover](#) (303-01B Engine - 4.2L SC V8 - AJV8, In-vehicle Repair).

20. Remove the crankshaft locking tool.

- Remove the screw.

21. Install both the CKP sensors.

For additional information, refer to: [Crankshaft Position \(CKP\) Sensor - 4.2L NA V8 - AJV8](#) (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

22. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L SC V8 - AJV8 - Twin Oil Coolers

In-vehicle Repair

Removal

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the radiator splash shield.
For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

3.  **CAUTION:** Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

- **NOTE:** Right-hand shown, left-hand similar.

Disconnect the 2 oil cooler lines.

- Position a container to collect the engine oil.
- Remove the 2 nuts.
- Remove and discard the 2 O-ring seals.
- Remove the 2 brackets.

4. **NOTE:** Right-hand shown, left-hand similar.

Remove the oil cooler.

- Remove the 4 securing nuts.

Installation

1. Install the oil cooler.

- Install the support brackets.
- Install the retainer.
- Tighten to 5 Nm.

2. Connect the oil cooler lines.

- Clean the components.
- Install new O-ring seals.
- Tighten to 7 Nm.

3. Install the radiator splash shield.

For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

4. Check and top-up the engine oil.

Engine - 4.2L SC V8 - AJV8 - Valve Cover LH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the evaporative emission canister purge valve.
For additional information, refer to: [Evaporative Emission Canister Purge Valve - 4.2L SC V8 - AJV8](#) (303-13 Evaporative Emissions - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
3. Remove the secondary bulkhead LH panel.
For additional information, refer to: [Secondary Bulkhead Panel LH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).
4. Remove the ignition coil-on-plug.
For additional information, refer to: [Ignition Coil-On-Plug - 4.2L SC V8 - AJV8](#) (303-07 Engine Ignition - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
5. Remove the remaining ignition coil-on-plugs.
6. Remove the oil level indicator and tube.
 - Remove the nut.
 - Remove and discard the O-ring seal.

7. Disconnect the variable camshaft timing (VCT) oil control solenoid electrical connector.
8. Disconnect fuel line from the fuel rail.
For additional information, refer to: [Spring Lock Couplings](#) (310-00 Fuel System - General Information, General Procedures).
9. Release the wiring harness.

10. Disconnect the 2 electrical connectors.

11. Release the engine wiring harness.

- Release the 3 clips.

12. Detach the fuel vapour valve from the mounting bracket.

13. Detach the mounting bracket and position it to one side.

14. NOTE: Note the fitted position of the retaining bolts prior to removal.

Remove the valve cover.

- Remove the 14 valve cover retaining bolts.

15. Remove and discard the valve cover retaining bolt O-ring seals.

16. Remove and discard the valve cover gasket.

- Carefully remove the sealant.

17. Remove and discard the valve cover plug aperture seals.

18. Remove and discard the VCT oil control solenoid seal.

19. NOTE: Do not disassemble further if the component is removed for access only.

Remove the oil filler pipe.

- Remove and discard the O-ring seal.

E61613

Installation

1. Install the oil filler pipe.

- Install a new O-ring seal.

E61613

2. Install the new VCT oil control solenoid seal.

3. Install the new valve cover plug aperture seals.

E46677

4. Install a new valve cover gasket.

- Clean the components.

5. NOTE: Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3mm diameter 12mm long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

E49922

Install the valve cover.

- Clean the component mating faces.

6. Install valve cover retaining bolts to their position previously noted.

E46679

- Install new valve cover bolt O-ring seals.
- Complete the tightening sequence as illustrated.
- Tighten the bolts to 12 Nm.

7. Attach the engine wiring harness.

- Secure with the clips.

E81265

8. Connect the VCT oil control solenoid electrical connector.

9. Attach the mounting bracket.

10. Attach the fuel vapour valve to the mounting bracket.

11. Attach the wiring harness.

12. Connect the two electrical connectors.

13. Connect the fuel line.

For additional information, refer to: [Spring Lock Couplings](#) (310-00 Fuel System - General Information, General Procedures).

14. Install the secondary bulkhead LH panel.

For additional information, refer to: [Secondary Bulkhead Panel LH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and

Installation).

15. Install the oil level indicator and tube.

- Install a new O-ring seal.
- Tighten the nut to 6 Nm.

16. Install the ignition coil-on-plug.

For additional information, refer to: [Ignition Coil-On-Plug - 4.2L SC V8 - AJV8](#) (303-07 Engine Ignition - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

17. Install the remaining ignition coil-on-plugs.

18. Install the evaporative emission canister purge valve.

For additional information, refer to: [Evaporative Emission Canister Purge Valve - 4.2L SC V8 - AJV8](#) (303-13 Evaporative Emissions - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

19. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L SC V8 - AJV8 - Valve Cover RH

In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the ignition coil-on-plug.
For additional information, refer to: [Ignition Coil-On-Plug - 4.2L SC V8 - AJV8](#) (303-07 Engine Ignition - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
3. Remove the remaining ignition coil-on-plugs.
4. Remove the secondary bulkhead RH panel.
For additional information, refer to: [Secondary Bulkhead Panel RH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).
5. Disconnect the positive crankcase ventilation (PCV) line.

6. Remove the engine cover bracket.
 - Remove the 3 nuts.
 - Release the 2 wiring harness clips.
 - Release the hose.

7. Release the engine wiring harness.
 - Release the 4 clips.

8. Release the coil-on-plug wiring harness.

- Release the 2 clips.

9. Disconnect the variable camshaft timing (VCT) oil control solenoid electrical connector.

10. NOTE: Note the fitted position of the retaining bolts prior to removal.

Remove the valve cover.

- Remove the 14 valve cover retaining bolts.

11. Remove and discard the valve cover retaining bolt O-ring seals.

12. Remove and discard the valve cover gasket.

- Carefully remove the sealant.

13. Remove and discard the valve cover plug aperture seals.

E46677

14. Remove and discard the VCT oil control solenoid seal.

15. NOTE: Do not disassemble further if the component is removed for access only.

Remove the PCV valve.

- Remove the 2 Torx screws.
- Remove and discard the O-ring seal.

E61621

Installation

1. Install the PCV valve.

- Clean the component mating faces.
- Install a new O-ring seal.
- Tighten the Torx screws.

E61621

2. Install the new VCT oil control solenoid seal.

3. Install new valve cover plug aperture gaskets.

4. Install a new valve cover gasket.

E46677

5. NOTE: Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3mm diameter 12mm long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

E49922

Install the valve cover.

- Clean the component mating faces.

6. Install valve cover retaining bolts to their position previously noted.

E46679

- Install new valve cover bolt O-ring seals.
- Tighten the bolts to 12 Nm.
- Complete the tightening sequence as illustrated.

7. Connect the VCT oil control solenoid electrical connector.

E81384

8. Attach the coil-on-plug wiring harness.

- Secure with the clips.

E81383

9. Attach the engine wiring harness.

- Secure with the clips.

E81382

10. Install the engine cover bracket.

- Secure the wiring harness.
- Secure the hose.
- Tighten to 6 Nm.

E81381

11. Connect the PCV line.

E46670

12. Install the secondary bulkhead RH panel.

For additional information, refer to: [Secondary Bulkhead Panel RH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).

13. Install the ignition coil-on-plug.

For additional information, refer to: [Ignition Coil-On-Plug - 4.2L SC V8 - AJV8](#) (303-07 Engine Ignition - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

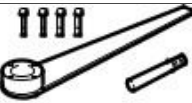

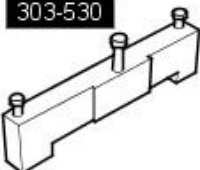

14. Install the remaining ignition coil-on-plugs.

15. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L SC V8 - AJV8 - Crankshaft Main Bearing Carrier

Removal and Installation

---	---

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the engine.
For additional information, refer to: [Engine](#) (303-01B Engine - 4.2L SC V8 - AJV8, Installation).
4. Mount the engine to an engine stand.
5. Release the supercharger belt.
 - Rotate the drive belt tensioner clockwise. Use a 1/2 inch square drive bar to rotate the drive belt tensioner.

6. Remove the supercharger belt.

7. Remove the supercharger belt idler pulley.

8. Remove the mounting bracket.

E82649

9. Disconnect the 2 oil cooler hoses.

VUJ0001553

10. Remove the exhaust manifold heat shield.

- Remove the 2 bolts.

E58797

11. Release the accessory drive belt.

- Rotate the accessory drive belt tensioner counter-clockwise, using a 3/8 " drive wrench.

E64940

12. Remove the accessory drive belt tensioner.

- Remove the bolt.

13. NOTE: Note the fitted position of the accessory drive belt.

Remove the accessory drive belt.

14. Remove the accessory drive belt idler pulley.

- Remove the bolt.

15. NOTE: Restrain the pulley to aid the removal of the bolts.

Using the special tool, remove the coolant pump pulley.

- Remove and discard the 3 bolts.

16. Remove the coolant pump.

- Remove the 5 bolts.
- Remove and discard the gasket.

17. NOTE: Right-hand shown, left-hand similar.

Remove both the engine mounts and brackets.

- Remove the 4 bolts.
- Repeat the above procedure for the other side.

18. Remove the air conditioning (A/C) compressor.

- Remove the 3 bolts.
- Disconnect the electrical connector.

19. Remove the power steering pump.

- Remove the 4 bolts.

20. Remove the A/C compressor mounting bracket.

- Remove the 4 bolts.

21. Remove the power steering pump mounting bracket.

- Remove the 4 bolts.

22. Disconnect the battery positive cable and the generator electrical connector.

- Release the cover.
- Remove the nut.
- Disconnect the electrical connector.

23. Remove the generator.

- Remove the nut.
- Remove the nut and bolt.

24. RH side: Release the engine wiring harness.
Remove the generator mounting bracket.

- Remove the 4 bolts.

26. Disconnect the battery positive cable.

- Release the cover.
- Remove the nut.

27. Disconnect the starter motor solenoid electrical connector.

- Remove and discard the nut.

28. Remove the starter motor.

- Remove the 2 bolts.

29. Disconnect the coolant hoses from the thermostat housing.

30. Disconnect the engine coolant temperature (ECT) sensor electrical connector.

31. Reposition the thermostat housing hose retaining clip.

32. Disconnect the coolant hose.

33. Disconnect the heater supply hose from the thermostat housing.

34. Disconnect the coolant hose.

35. Remove the thermostat housing retaining bolts.

36. Remove the thermostat housing.
● Remove and discard the O-ring seals.

VUJ0001576

- 37. NOTE:** Some oil spillage is inevitable during this operation.
- **NOTE:** Clean the components general area prior to dismantling.
- Remove the oil filter.

E82652

- 38.** Disconnect the engine oil pressure (EOP) sensor electrical connector.
- 39.** Disconnect the engine oil temperature sensor electrical connector.

E82653

- 40.** Remove the oil filter housing.
- Remove the 3 bolts.
 - Remove and discard the O-ring seal.

VUJ0001584

- 41. NOTE:** Right-hand shown, left-hand similar.
- Release the 2 heated oxygen sensor (HO2S) harness brackets.

E30646

- 42.** Disconnect the crankshaft position (CKP) sensor electrical connector.

43. Release the engine wiring harness.

- Release the 2 clips.
- Remove the bolt.

44. Release the wiring harness from the LH side of the engine.

- Release the clips.

45. Release the wiring harness from the RH side of the engine.

- Release the clips.

46. Remove the CKP sensor.

- Remove the bolt.

47.  CAUTION: Under no circumstances should the crankshaft setting peg, 303-645, be used in the following operations, to restrain the crankshaft.

Using the special tools, retain the crankshaft pulley.

48. NOTE: The crankshaft pulley retaining bolt will be very tight.

Using the special tools, remove the crankshaft pulley bolt.

- Discard the bolt.
- Remove the special tools.

49. NOTE: The crankshaft pulley will be very tight.

Using the special tools, remove the crankshaft pulley.

- Collect the locking ring.
- Remove the special tools.

E46724

50. Using the special tool, remove and discard the crankshaft front seal.

51. NOTE: Right-hand shown, left-hand similar.

Remove both the ignition coil-on-plug covers.

- Release from the 2 clips.

52. Disconnect the RH ignition coil-on-plug electrical connector.

53. Remove the RH ignition coil-on-plug.

- Remove the bolt.
- Remove and discard the seal.

54. Remove the remaining RH ignition coil-on-plugs.

55. Disconnect the LH variable camshaft timing (VCT) oil solenoid electrical connector.

56. Disconnect the valve cover breather hose.

57. Release the engine wiring harness from the retaining bracket.

58. Disconnect the RH variable camshaft timing (VCT) oil solenoid electrical connector.

59. NOTE: Note the fitted position of the retaining bolts prior to removal.

Remove the RH valve cover.

- Remove the 14 valve cover retaining bolts.
- Remove the engine cover bracket.

60. Remove and discard the RH valve cover gaskets.

- Remove and discard the seals.

E46677

61. Disconnect the LH ignition coil-on-plug electrical connector.

E46066

62. Remove the LH ignition coil-on-plug.

- Remove the bolt.
- Remove and discard the seal.

E46053

63. Remove the remaining LH ignition coil-on-plugs.

64. Remove the oil level indicator and tube.

- Remove the oil level indicator.
- Remove the nut.
- Remove the tube.
- Remove and discard the O-ring seal.

E46646

65. Release the engine wiring harness from the retaining bracket.

E46647

66. NOTE: Note the fitted position of the retaining bolts prior to removal.

Remove the LH valve cover.

- Remove the 14 valve cover retaining bolts.

E30696

67. Remove and discard the LH valve cover gaskets.

- Remove and discard the seals.

E46652

68. NOTE: Install the special tool to the crankshaft sensor aperture.

Lock the crankshaft.

- Install the special tool.
- Install the bolt.

E61688

69. Remove the engine front cover.

- Remove the 24 bolts.
- Remove and discard the gasket.
- Remove and discard the 3 O-ring seals.

VUJ0002398

70. Remove the RH VCT housing.

- Remove the 3 bolts.
- Remove and discard the O-ring seals.

E30699

71. Install the special tool to the RH cylinder head.

- Install the 3 bolts.

E46859

72. Remove the RH primary timing chain tensioner assembly.

- Remove the 2 bolts.

73. Remove the RH primary timing chain tensioner guide.

- Remove the bolt.

74. Remove the RH primary timing chain.

75. Remove the LH VCT housing.

- Remove the 3 bolts.
- Remove and discard the O-ring seals.

76. Install the special tool to the LH cylinder head.

- Install the 3 bolts.

77. Remove the LH primary timing chain tensioner.

- Remove the 2 bolts.

78. Remove the LH upper and lower primary timing chain tensioner guides.

- Remove the 2 bolts.

79. Remove the LH primary timing chain.

80. NOTE: Note the orientation of the crankshaft sprocket.

Remove the crankshaft sprocket.

- Remove the crankshaft sprocket key.

81. Remove the special tool.

82. Remove the torque converter flexplate.

- Remove and discard the 8 bolts.

83.  CAUTION: Note the position of the bolts, prior to removal.

Remove the oil pan.

- Remove the 17 bolts.
- Remove and discard the gasket.

84. Remove the oil strainer pick-up assembly.

- Remove the 2 bolts.
- Remove and discard the O-ring seal.

85. Remove the oil pan extension.

- Remove the 18 bolts.

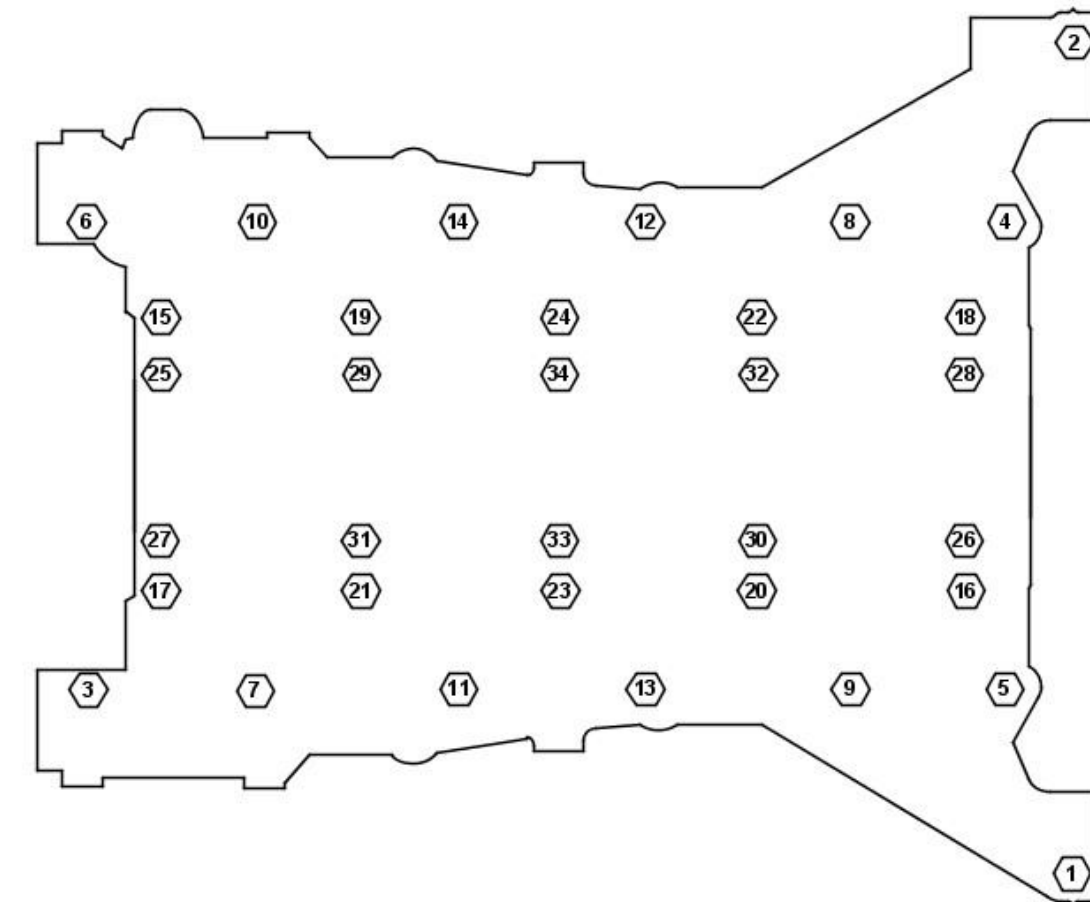

86. Remove the oil pump assembly.

- Remove the 4 bolts.
- Remove and discard the gasket.
- Clean the component mating faces.

87. Remove the baffle plate.

- Remove the 6 bolts.

88. 
WARNING: To make sure damage does not occur to the crankshaft and piston components, the engine must be inverted on the engine stand. Failure to follow this instruction may result in damage to the engine.

• **NOTE:** If the crankshaft main bearing carrier retaining bolts have been marked with a center punch dot, they must be discarded and new bolts installed.

Remove the crankshaft main bearing carrier.

- Remove the crankshaft main bearing carrier retaining bolts in the indicated sequence.

89. Discard the crankshaft rear main oil seal.

Installation

1. CAUTIONS:

 Use only a plastic scraper when removing the sealing material.

 If any new bolts are to be installed to retain the crankshaft main bearing carrier, pre-stress the retaining bolts by installing the crankshaft main bearing carrier without any sealant and tightening the new retaining bolts to the specified torque. Remove the crankshaft main bearing carrier once the bolts have been pre-stressed. Failure to follow this instruction may result in damage to the vehicle.

Clean all the mating faces and reusable parts thoroughly and check for damage.

2. NOTE: Install the crankshaft main bearing carrier and tighten bolts to specification within twenty minutes of applying the sealant.

Apply a 2 mm bead of sealant to the cylinder block in the area shown.

- Use WSS-M4G323-A4-RTV sealant.

3. NOTE: Install the crankshaft main bearing carrier and tighten bolts to specification within twenty minutes of applying the sealant.

Apply a 1 mm bead of sealant to the cylinder block in the area shown.

- Use WSS-M4G323-A4-RTV sealant.

4.  CAUTION: Make sure all dowels are fully seated into the crankshaft main bearing carrier prior to tightening the bolts.

- NOTE: Do not lubricate the crankshaft main bearing carrier retaining bolts.

- NOTE: Do not rotate the crankshaft until all the retaining bolts are tightened to specification.

- NOTE: The retaining bolts must be tightened within twenty minutes of applying the sealant.

- NOTE: Tighten the retaining bolts in the sequence shown.

Install the crankshaft main bearing carrier to the cylinder block.

1. Stage 1: Bolts 21 to 32, tighten to 15 Nm.
2. Stage 2: Bolts 33 to 34, tighten to 15 Nm.
3. Stage 3: Bolts 1 to 10, tighten to 25 Nm.
4. Stage 4: Bolts 11 to 20, tighten to 15 Nm.
5. Stage 5: Bolts 1 to 10, tighten to 35 Nm, then a further 135 degrees.
6. Stage 6: Bolts 11 to 20, tighten to 20 Nm, then a further 150 degrees.
7. Stage 7: Bolts 21 to 32, tighten to 20 Nm, then a

further
90
degrees.

8. Stage 8:
Bolts 33
to 34,
tighten
to 20
Nm,
then a
further
150
degrees.

9. Stage 9:
Center
punch
each of
the bolt
heads
to
indicate
it has
been
reused.

5. Rotate the crankshaft to check correct operation.

6. Remove excess sealant which may squeeze out at the front cover sealing surfaces.

7. Install the baffle plate.

- Tighten the 6 bolts to 6 Nm.

E82656

8. NOTE: Carefully remove the transit sleeve, leaving the seal in place.

• NOTE: Make sure that the transit sleeve is correctly positioned and install the new seal over the crankshaft. Do not use any lubricant on the seal, the transit sleeve or the crankshaft.

Using the special tool, position the crankshaft rear oil seal.

- Install the special tool to the crankshaft.

E31176

9.  CAUTION: Alternate the nut tightening to correctly seat the crankshaft rear oil seal.

Using the special tool, install the rear crankshaft oil seal.

E31177

E31176

10.  CAUTION: Make sure that the crankshaft rear oil seal is correctly located.

Remove the special tool.

E61688

11. Install the special tool.

- Install the bolt.

12. NOTE: Install a new gasket.

Install the oil pump assembly.

- Clean the component mating faces.
- Install the gasket.
- Tighten the bolts to 10 Nm.

13. NOTE: Prevent the flexplate from rotating.

Install the torque converter flexplate.

- Clean the component mating faces.
- Tighten the bolts evenly in 2 stages to the sequence shown.
- Tighten the bolts to 15 Nm.
- Tighten the bolts to 110 Nm.

E53833

14. NOTE: Install a new O-ring seal.

Install the oil strainer pick-up assembly.

- Install the O-ring seal.
- Tighten the bolts to 12 Nm.

15. Install the crankshaft sprocket.

- Clean the component mating faces.
- Install the crankshaft sprocket key.

16. Install the LH primary timing chain.

- Make sure the timing chain slack is on the tensioner side of the timing chain.

17. Install the LH primary timing chain tensioner guides.

- Tighten the bolts to 12 Nm.

E46871

18.  **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the LH primary timing chain tensioner.

- Using a 3 mm diameter rod, retain the timing chain tensioner adjuster.
- Tighten the bolts to 12 Nm.
- Remove the retaining rod.

19.  **CAUTION:** Make sure that new bolts are installed.

• **NOTE:** Install new O-ring seals.

Install the LH VCT control solenoid housing.

- Install the O-ring seals.
- Tighten the bolts to 22 Nm.
- Tighten the nut to 10 Nm.

20. Install the RH primary timing chain.

- Make sure the timing chain slack is on the tensioner side of the timing chain.

21. Install the RH primary timing chain tensioner guide.

- Tighten the bolts to 12 Nm.

22.  **CAUTION:** During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the RH primary timing chain tensioner.

- Using a 3 mm diameter rod, retain the timing chain tensioner adjuster.
- Tighten the bolts to 12 Nm.
- Remove the retaining rod.

E53556

23. **NOTE:** Install new O-ring seals.

• **NOTE:** Make sure that new bolts are installed.

Install the RH VCT control solenoid housing.

- Install the O-ring seals.
- Tighten the bolts to 22 Nm.
- Tighten the nut to 10 Nm.

24. Remove the special tool from the RH cylinder head.

303-530
E46859

25. Remove the special tool from the LH cylinder head.

26. Install the oil pan extension.

- Clean the component mating faces.
- Apply a 3 mm diameter bead of sealant, to the area shown.
- Install the bolts, but do not tighten fully at this stage.

27. Tighten the oil pan bolts in the sequence shown to 20 Nm.

E61688

28. Remove the special tool.

- Remove the bolt.

29. Install the CKP sensor.

- Tighten the bolt to 8 Nm.

30. Attach the wiring harness to the LH side of the engine.

- Secure the clips.

31. Attach the wiring harness to the RH side of the engine.

- Secure the clips.

32. Install the power steering pump mounting bracket.

- Tighten the bolts to 25 Nm.

33. NOTE: Install a new gasket.

- NOTE: Install a new O-ring seal.

Install the engine front cover.

- Clean the component mating faces.
- Apply a 3 mm diameter bead of sealant 12mm long, to the 8 places shown.
- Install the gasket.
- Install the O-ring seal.

E47100

34. Tighten the bolts in the sequence shown to 12 Nm.

E47101

35. Attach the engine wiring harness.

- Secure the clips.
- Tighten the bolt to 10 Nm.

36. NOTE: Install new seals.

Install the LH valve cover plug aperture seals.

E49922

37. NOTE: Install a new gasket.

• NOTE: Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3 mm (0.118 in) diameter 12 mm (0.47 in) long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

Install the LH valve cover.

- Clean the component mating faces.
- Install the valve cover gasket.

E46654

38. Install the LH valve cover bolts.

- Install the LH valve cover bolts to the positions previously noted.
- Tighten the bolts in the sequence shown to 12 Nm.

39. Connect the LH VCT oil solenoid electrical connector.

40. Attach the engine wiring harness to the retaining bracket.

41. NOTE: Install a new O-ring seal.

With assistance, install the oil level indicator and tube.

- Clean the component mating faces.
- Install the O-ring seal.
- Lubricate the O-ring seal with clean engine oil.
- Tighten the nut to 6 Nm.

42. NOTE: Install new O-ring seals.

Install the 4 LH ignition coil-on-plugs.

- Install the O-ring seals.
- Install the 4 ignition coil-on-plugs.
- Tighten the 6 bolts to 6 Nm.

43. Connect the 4 electrical connectors.

44. Install the LH ignition coil-on-plug cover.

45. NOTE: Install new seals.

Install new RH valve cover plug aperture seals.

46. NOTE: Install a new gasket.

• NOTE: Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3 mm (0.118 in) diameter 12 mm (0.47 in) long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

E49922

Install the RH valve cover.

- Clean the component mating faces.
- Install the gasket.

E46679

47. Install the RH valve cover bolts.

- Install the RH valve cover bolts to the positions previously noted.
- Tighten the bolts in the sequence shown to 12 Nm.

48. **NOTE:** Install new O-ring seals.

Install the 4 RH ignition coil-on-plugs.

- Install the O-ring seals.
- Install the 4 ignition coil-on-plugs.
- Tighten the bolts to 6 Nm.

49. Connect the 4 electrical connectors.

50. **NOTE:** Install new O-ring seals.

Install the coolant manifold.

- Clean the components.
- Install the O-ring seals.
- Connect the 4 coolant hoses and install the clips.
- Attach the wiring harness bracket.
- Tighten the bolts to 10 Nm.

51. Install the thermostat housing.

E30418

52. Connect the coolant hoses to the thermostat housing.

E30412

53. Connect and secure the ECT sensor electrical connector.

54. Connect the coolant hose.

55. Connect the heater supply hose to the thermostat housing.

56. Connect the RH VCT oil solenoid electrical connector.

57. Attach the engine wiring harness to the retaining bracket.

58. Reposition the thermostat housing hose retaining clip.

59. Connect the coolant hoses.

60. Clean the crankshaft pulley mating faces.
61. Using the special tool, install the crankshaft front seal.
- Lubricate the seal with clean engine oil.
 - Use the discarded crankshaft bolt with the special tool.
 - Remove the special tools.

62. Install the crankshaft pulley.
- Lubricate the seal with clean engine oil.

63. Install the crankshaft pulley locking ring.

64.  CAUTION: The screw thread in the crankshaft pulley must be cleaned out before installing a new crankshaft pulley bolt.

Install, but do not tighten, the new crankshaft pulley bolt.

65.  CAUTION: Under no circumstances should the crankshaft setting peg, 303-645, be used in the following operations, to restrain the crankshaft.

Using the special tools, tighten the crankshaft pulley bolt.

- Remove the special tools.
- Tighten the crankshaft pulley bolt to 380 Nm.

66. NOTE: Install a new O-ring seal.

Install the oil filter housing.

- Clean the component mating faces.
- Install a new O-ring seal.
- Tighten the bolts to 20 Nm.

67. NOTE: Install a new engine oil filter.

Install the engine oil filter.

- Lubricate the oil filter seal with clean engine oil and tighten to 18 Nm .

68. Connect the EOP sensor electrical connector.

69. Connect the engine oil temperature sensor electrical connector.

70. Install the starter motor.

- Clean the component mating faces.

- Tighten the bolts to 45 Nm.
71. Connect the starter motor solenoid electrical connector.
- Tighten the new nut to 7 Nm.
72. Connect the battery positive cable to the starter motor.
- Tighten the nut to 10 Nm.
 - Secure the cover.
73. Install the generator mounting bracket.
- Tighten the bolts to 25 Nm.
74. RH side: Attach the wiring harness.
- Secure the clips.
75. Install the generator.
- Tighten the nut to 25 Nm.
 - Tighten the nut and bolt to 40 Nm.
76. Connect the battery positive cable and generator electrical connector.
- Secure the cover.
 - Tighten the nut to 12 Nm.
77. Install the exhaust manifold heat shield.
- Tighten the 2 bolts.
78. Install the power steering pump mounting bracket.
- Tighten the bolts to 25 Nm.
79. Install the A/C compressor mounting bracket.
- Tighten the bolts to 25 Nm.
80. Install the power steering pump.
- Tighten the bolts to 25 Nm.
81. Install the A/C compressor.
- Tighten the bolts to 25 Nm.
 - Connect the electrical connector.
82. Install both engine mounts and brackets.
- Clean the component mating faces.
 - Tighten the bolts to 45 Nm.
 - Repeat the above procedure for the other side.
83. **NOTE:** Make sure that new bolts are installed.

Using the special tool, install the coolant pump pulley.

- Tighten the 5 bolts to 10 Nm.
- Tighten the bolts to 25 Nm.

84. Install the accessory drive belt idler pulley.

- Tighten the bolts to 25 Nm.

85. Install the accessory drive belt.

E54120

86. Install the accessory drive belt tensioner.

- Clean and inspect the drive pulleys for damage.
- Tighten the accessory drive belt tensioner bolt to 40 Nm.

87. Install the mounting bracket.

E82649

88. Install the supercharger belt idler pulley.

E82649

89. Install the supercharger belt.

- Rotate the drive belt tensioner clockwise. Use a 1/2 inch square drive bar to rotate the drive belt tensioner.

E80253

90. Connect the oil cooler hoses.

91. Remove the engine from the engine stand.

92. Install the engine.

For additional information, refer to: [Engine](#) (303-01B Engine - 4.2L SC V8 - AJV8, Installation).

93. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine - 4.2L SC V8 - AJV8 - Engine

Removal

Special Tool(s)	
 303-536	Engine lifting brackets 303-536
 303-749	Engine lifting brackets 303-749

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Evacuate the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
4. Remove the transmission.
For additional information, refer to: [Transmission - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (307-01 Automatic Transmission/Transaxle - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal).
5. Install the torque converter retainer.
6. Remove the cooling module.
For additional information, refer to: [Cooling Module - 4.2L SC V8 - AJV8](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).

7. Remove the hood.

8. Remove the secondary bulkhead LH panel.

For additional information, refer to: [Secondary Bulkhead Panel LH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).

9. Remove the pedestrian protection hood actuator.

For additional information, refer to: [Pedestrian Protection Hood Actuator LH](#) (501-20C Pedestrian Protection System, Removal and Installation).

10. Remove the engine control module (ECM) cover.

11. Release the ECM wiring harnesses and position aside.

12. Disconnect the engine wiring harness.

13. Release the secondary air injection (AIR) vacuum reservoir.

14. Disconnect the fuel line.

15. Release the pedestrian protection actuator bracket.

16. Release the ECM wiring harnesses and position aside.

17.  CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Release the clip and disconnect the purge inlet line.

18. Disconnect the brake booster vacuum hose from the intake manifold.

E97758

19.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Disconnect the refrigerant lines from the A/C compressor.

- Remove the 2 bolts.
- Remove and discard the 2 O-ring seals.

E98591

20.  **CAUTION:** Always plug any open connections to prevent contamination.

Disconnect the high pressure line from the power steering pump.

- Remove and discard the O-ring seal.

E98592

21.  **WARNING:** Fluid loss is unavoidable, use absorbent cloth or a container to collect the fluid.

 **CAUTION:** Always plug any open connections to prevent contamination.

Disconnect the low pressure line from the power steering pump.

- Release the clip.

22. Disconnect the crankshaft position (CKP) sensor electrical connector.

23. Disconnect the battery positive cable from the generator.

24. NOTE: RH illustration shown, LH is similar.

Release the engine mounts.

- Remove and discard the 2 nuts.

25. Lower the vehicle.

26. Install the special tools to the engine.

- Support the engine.
- Install the lifting chains.

27. Install the lifting equipment to the vehicle.

28. Remove the engine.

- With assistance, carefully remove the engine.

Engine - 4.2L SC V8 - AJV8 - Engine

Installation

Special Tool(s)	
 <p>303-536</p>	<p>Engine lifting brackets 303-536</p>
 <p>303-749</p>	<p>Engine lifting brackets 303-749</p>

Installation

1. Remove the torque converter retainer.
2. Carefully lower the engine onto the engine mounts.
 - Clean the components.
 - Tighten to 63 Nm.
3. Remove the special tools.
4. Connect the battery positive cable to the generator.

5. Connect the CKP sensor electrical connector.

6. Connect the main engine wiring harness to the engine control module (ECM).

7. Connect the engine wiring harness.

- Tighten to 10 Nm.

8. Install the ECM cover.

9.  **WARNING:** Fluid loss is unavoidable, use absorbent cloth or a container to collect the fluid.

 **CAUTION:** Always plug any open connections to prevent contamination.

Connect the low pressure line to the power steering pump.

- Secure the clip.

10.  **CAUTION:** Always plug any open connections to prevent contamination.

Connect the high-pressure power steering line to the power steering pump.

- Install a new O-ring seal.
- Tighten to 20 Nm.

11.  **CAUTION:** Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

Connect the refrigerant lines to A/C compressor.

- Install new retaining bolts.
- Install new O-ring seals.
- Tighten to 9 Nm.

12. Connect the brake booster vacuum hose to the intake manifold.

13. Secure the secondary air injection (AIR) vacuum reservoir.

14.  CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Connect the purge valve.

15. Install the ECM cover.

16. Secure the pedestrian protection actuator bracket.

17. Connect the fuel line.

18. Install the pedestrian protection hood actuator.
For additional information, refer to: [Pedestrian Protection Hood Actuator LH](#) (501-20C Pedestrian Protection System, Removal and Installation).
19. Install the secondary bulkhead LH panel.
For additional information, refer to: [Secondary Bulkhead Panel LH - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (501-02 Front End Body Panels, Removal and Installation).
20. Install the cooling module.
For additional information, refer to: [Cooling Module - 4.2L SC V8 - AJV8](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal and Installation).
21. Install the transmission.
For additional information, refer to: [Transmission - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8](#) (307-01 Automatic Transmission/Transaxle - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Removal).
22. Recharge the A/C system.
For additional information, refer to: [Air Conditioning \(A/C\) System Recovery, Evacuation and Charging](#) (412-00 Climate Control System - General Information, General Procedures).
23. Fill and bleed the cooling system.

For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03, General Procedures).

24. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

25. Install the hood.

- Tighten to 25 Nm

E100919

Engine Cooling - TDV6 2.7L Diesel - Engine Cooling - Overview

Description and Operation

Overview

The engine cooling system maintains the engine within an optimum temperature range under changing ambient and engine operating conditions. It also provides:

- Heating for the passenger compartment.
Refer to: [Heating and Ventilation](#) (412-01 Climate Control, Description and Operation).
- Cooling for:
 - The engine oil.
 - The fuel.
 - The [EGR \(exhaust gas recirculation\)](#) system.
Refer to: [Engine Emission Control](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Description and Operation).
 - The transmission fluid.
Refer to: [Transmission Cooling - Vehicles With: ZF 6HP26](#) (307-02 Transmission/Transaxle Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol/TDV6 2.7L Diesel, Description and Operation).

Engine Cooling - TDV6 2.7L Diesel - Engine Cooling - System Operation and Component Description

Description and Operation

System Operation

When the engine is running the coolant is circulated around the engine cooling system by the coolant pump and the auxiliary coolant pump. From the outlet of the coolant pump, coolant flows through the cylinder block and the cylinder heads to the outlet connector. Some of the coolant in the cylinder block is diverted through the engine oil and fuel coolers before returning to the outlet connector. From the outlet connector the bulk of the coolant flows to the thermostat, either directly or via the radiator, depending on the temperature of the coolant. From the outlet of the thermostat the coolant flows to the inlet connector and then to the coolant pump.

Coolant from the outlet connector also flows through the [EGR \(exhaust gas recirculation\)](#) coolers and then the heater core. From the heater core outlet, the coolant flows to the inlet connector via the auxiliary coolant pump. Refer to: [Heating and Ventilation](#) (412-01 Climate Control, Description and Operation).

The transmission coolant control valve controls the flow and temperature of coolant to the transmission oil cooler from the radiator and/or the engine outlet. The transmission control valve regulates the temperature of the coolant supplied to the transmission oil cooler to maintain the transmission oil at the optimum operating temperature. The coolant from the outlet of the transmission oil cooler returns to the inlet connector with the flow of coolant from the thermostat.

If the coolant level in the expansion tank decreases below a predetermined value, the level sensor connects a ground to the instrument cluster, which activates the appropriate warning.

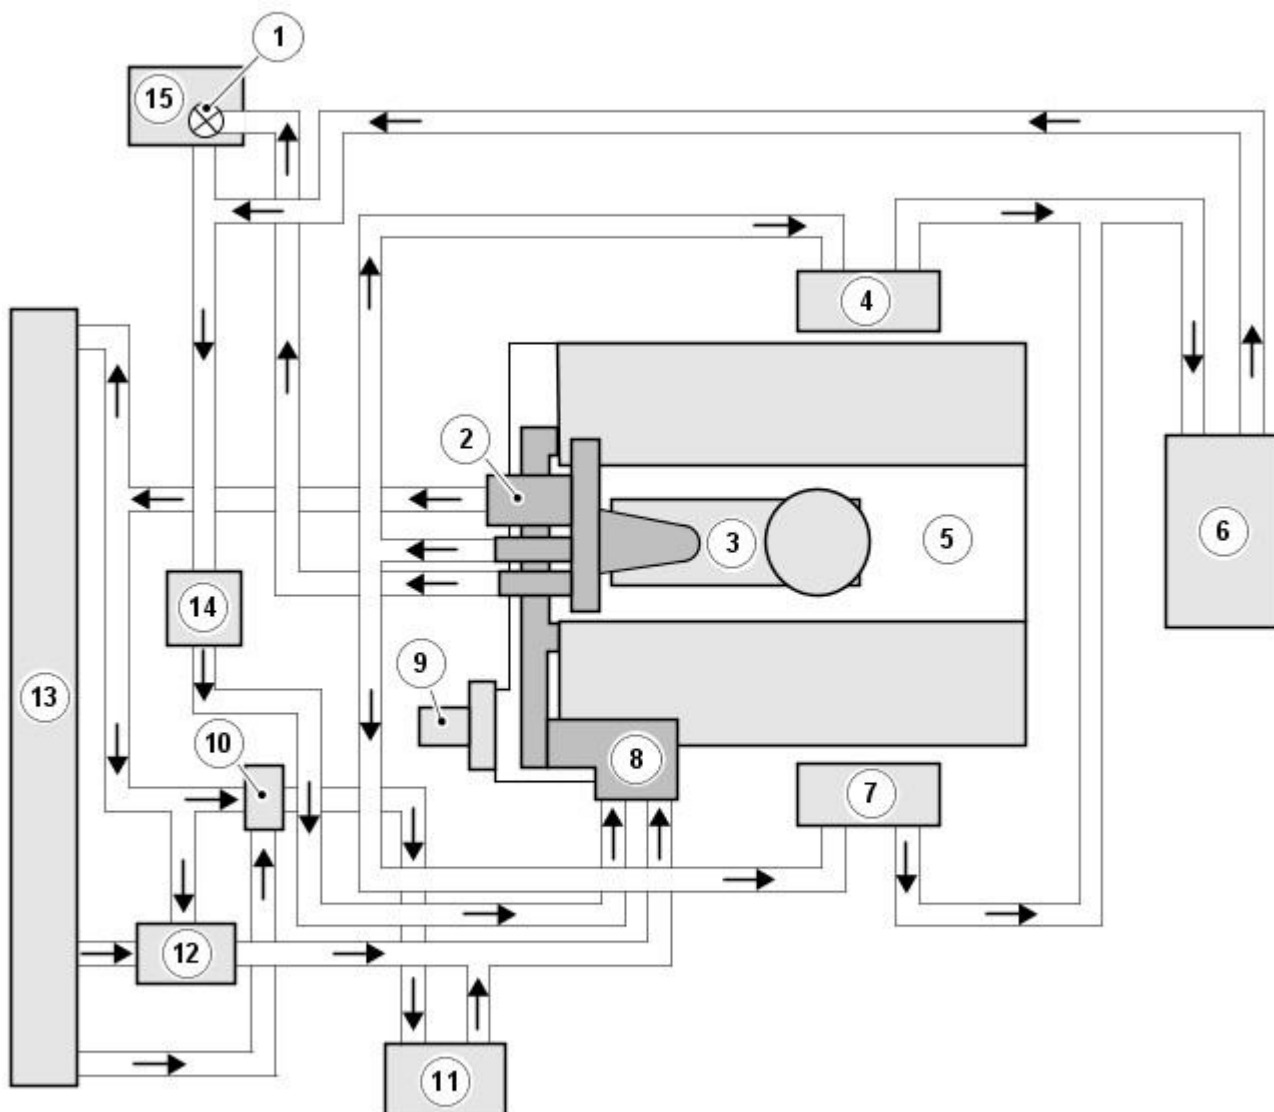

Refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation).

The cooling fan is operated by a fan control module integrated into the cooling fan motor. The fan control module regulates the voltage, and thus speed, of the cooling fan motor in response to a [PWM \(pulse width modulation\)](#) signal from the [ECM \(engine control module\)](#). The [ECM](#) calculates the required fan speed from the engine temperature, [A/C \(air conditioning\)](#) system pressure and transmission oil temperature.

Under hot operating conditions, the fan may continue to operate for four minutes after the engine has been switched off.

Refer to: [Electronic Engine Controls](#) (303-14A Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

13	Radiator
14	Auxiliary coolant pump
15	Expansion tank

Component Description**General**

The primary components of the engine cooling system are the:

- Coolant pump.
- Thermostat.
- Radiator.
- Cooling fan.
- Expansion tank.
- Engine oil and fuel coolers.
- Connecting hoses and pipes.

The engine cooling system also supplies coolant to:

- The heater core.
Refer to: [Heating and Ventilation](#) (412-01 Climate Control, Description and Operation).
- The [EGR](#) coolers.
Refer to: [Engine Emission Control](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Description and Operation).
- The transmission oil cooler.
Refer to: [Transmission Cooling - Vehicles With: ZF 6HP26](#) (307-02 Transmission/Transaxle Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol/TDV6 2.7L Diesel, Description and Operation).

Coolant Pump

E97921

ItemDescription

1	Bolt (3 off)
2	Drive hub

3 Housing

4 Impeller

5 Pulley

The coolant pump has a housing that supports a shaft with an impeller attached to one end and a drive hub at the other. The housing is attached to the front of the cylinder block with the impeller located in a pumping chamber. The pump is driven by a pulley attached to the drive hub and driven by the accessory drive belt.

Refer to: Accessory Drive (303-05 Accessory Drive - 2.7L Diesel, Description and Operation).

Thermostat

E97922

ItemDescription

1 From engine outlet connector

2 To engine inlet connector

3 Radiator end tank connection

The thermostat is an ambient bias thermostat located in a sealed housing attached to the [LH](#) end tank of the radiator. The thermostat opens at a nominal temperature of 82 °C (180 °F). This opening is delayed at lower ambient temperatures to improve heater performance. When the engine is cold the thermostat is closed and directs coolant from the outlet connector to the coolant pump. When the engine is warm the thermostat is open and directs coolant from the radiator to the coolant pump.

Radiator

E97923

ItemDescription

1	Locating spigot (2 off)
2	Coolant inlet
3	Support (2 off)
4	Drain plug
5	Coolant outlet (to thermostat)
6	Coolant outlet (to transmission (coolant) control valve)

The radiator is a cross flow type with an aluminum core and plastic end tanks. The radiator is located in the vehicle by locating spigots and supports integrated into the end tanks. The supports are installed in rubber bushes in the upper chassis rails. The locating spigots are installed in rubber bushes in the front end carrier. A drain plug is integrated into the LH end tank. Coolant inlet and outlet connections are incorporated into the RH and LH end tanks respectively.

Cooling Fan

E97924

ItemDescription

1	Shroud
2	Electrical connector
3	Fan
4	Motor and fan control module

An electric, variable speed cooling fan is installed in a shroud attached to the rear of the radiator. The cooling fan is operated by a fan control module, integrated into the electric motor, under the control of the [ECM](#). Electrical connectors at the [RH](#) side of the shroud provides the interface between the cooling fan harness and the vehicle wiring.

Expansion Tank

E97925

ItemDescription

1	Bleed screw
2	Level markings
3	Vent hose connection
4	Expansion hose connection
5	Level sensor
6	Filler cap

A pressurized expansion tank system is used which continuously separates the air from the cooling system and replenishes the system through a hose connected between the expansion tank and the heater return hose. A continuous vent into the expansion tank, through a hose connected to the engine's coolant outlet connector, prevents air locks from forming in the cooling system.

The expansion tank is installed behind the top right corner of the radiator. A filler cap, bleed screw and level sensor are incorporated into the expansion tank. MAX and MIN level markings are molded into the interior of the tank below the filler cap. The expansion tank provides the following functions:

- Service fill.
- Coolant expansion during warm-up.
- Air separation during operation.
- System pressurization by the filler cap.

The expansion tank has an air space of approximately 0.5 to 1 liter (1.06 to 2,11 US pints), above the MAX level, to allow for coolant expansion.

Engine Oil and Fuel Coolers

E97926

ItemDescription

1	Engine oil filter
2	Locator pin
3	Engine oil cooler
4	Coolant inlet (from cylinder block)
5	Adapter assembly
6	Fuel cooler
7	Fuel inlet and outlet connections
8	Coolant outlet (to engine coolant outlet connector)

The engine oil cooler and the fuel cooler are attached to a common adapter assembly located in the vee of the cylinder block. Inlet and outlet ports for engine oil, and an inlet port for coolant, are incorporated into the cylinder block mating face of the adapter assembly. A metal gasket seals the joint between the adapter assembly and the cylinder block.

From the cylinder block, coolant flows through the adapter assembly and into the two coolers. After passing through the two coolers, the coolant then flows into the engine coolant outlet connector via an outlet on the fuel cooler.

Engine Coolant

The engine coolant is formulated to last for ten years or 240,000 km (150,000 miles). The coolant is silicate free and must not be mixed with conventional engine coolant.

Engine Cooling - TDV6 2.7L Diesel - Engine Cooling

Diagnosis and Testing

Principles of Operation

For detailed description of the diesel engine cooling system, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (303-03A Engine Cooling - TDV6 2.7L Diesel)

[Engine Cooling](#) (Description and Operation),

[Engine Cooling](#) (Description and Operation),

[Engine Cooling](#) (Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> Leaks Coolant expansion tank Electric fan Radiator 	<ul style="list-style-type: none"> Fuse Wiring harness Loose or corroded connector(s) Engine Coolant Temperature (ECT) sensor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If there are clear symptoms refer to the table below, alternatively, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Cause	Action
Coolant loss	<ul style="list-style-type: none"> Hoses Hose connections Radiator Coolant pump Heater core Gaskets Engine casting cracks Engine block core plugs 	<ul style="list-style-type: none"> GO to Pinpoint Test A.
Engine overheating	<ul style="list-style-type: none"> Engine coolant (level/condition) Thermostat Fan motor Fan motor fuses and/or circuits ECT sensor Engine control module (ECM) Fan speed module 	<ul style="list-style-type: none"> GO to Pinpoint Test B.
Engine not reaching normal operating temperature	<ul style="list-style-type: none"> Thermostat Electric fan Fan speed module 	<ul style="list-style-type: none"> GO to Pinpoint Test C.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: If the module or a component is suspect and the vehicle remains under the Manufacturers warranty, refer to the Warranty Policy and Procedure manual (section B1.2), or determine if any prior approval programme is in operation, prior to the Check and installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action
P011626	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	<ul style="list-style-type: none"> Signal rate of change below threshold 	Refer to the electrical circuit diagrams and check ECT sensor circuits for short, open circuit and poor connection. From engine cold, check and record 'Engine coolant temperature' datalogger signal. After approximately 20 minutes, check and record signal, if value has NOT increased by more than 10°C install a new sensor as required
P011716	Engine Coolant Temperature Sensor 1 Circuit Low Input	<ul style="list-style-type: none"> Circuit voltage below threshold Engine coolant temperature sensor 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check ECT sensor signal circuit for short to ground. Check and install a new sensor as required

DTC	Description	Possible Cause	Action
		failure	
P011817	Engine Coolant Temperature Sensor 1 Circuit High Input	<ul style="list-style-type: none"> ● Circuit voltage above threshold ● Engine coolant temperature sensor failure 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check ECT sensor signal circuit for short to power. Check and install a new sensor as required
P011927	Engine Coolant Temperature Sensor 1 Circuit Intermittent/Erratic	<ul style="list-style-type: none"> ● Signal rate of change above threshold ● Engine coolant temperature sensor failure 	Refer to the electrical circuit diagrams and check engine coolant temperature sensor circuits for short, open circuit and poor connections. Run engine to normal operating temperature, check and record ' Engine coolant temperature ' datalogger signal, increase engine speed by 2000 rpm, after 120 seconds check and record signal. If value of signal has increased faster than 5°C/second install new sensor as required
P048011	Fan 1 Control Circuit	<ul style="list-style-type: none"> ● Cooling fan 1 control circuit - short to ground 	Refer to the electrical circuit diagrams and check the fan 1 control circuit for short to ground
P048012	Fan 1 Control Circuit	<ul style="list-style-type: none"> ● Cooling fan 1 control circuit - short to power 	Refer to the electrical circuit diagrams and check the fan 1 control circuit for short to power
P048013	Fan 1 Control Circuit	<ul style="list-style-type: none"> ● Cooling fan 1 control circuit - open circuit 	Refer to the electrical circuit diagrams and check the fan 1 control circuit for open circuit
P048397	Fan Rationality Check	<ul style="list-style-type: none"> ● Cooling fan obstructed or blocked 	Check and clear any blockage or restriction from fan
P048400	Fan Circuit Over Current	<ul style="list-style-type: none"> ● Cooling fan seizure ● Cooling fan rotor jammed/blocked ● Cooling fan motor damage/fault 	Check and clear any blockage or restriction from fan. Check and install new components as required, refer to the new module/component installation note at the top of the DTC Index
P069100	Fan 1 Control Circuit Low	<ul style="list-style-type: none"> ● Cooling fan control circuit - short to ground, open circuit 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check cooling fan control circuit for short to ground, open circuit
P069200	Fan 1 Control Circuit High	<ul style="list-style-type: none"> ● Cooling fan control circuit - short to power 	Refer to the electrical circuit diagrams and check cooling fan control circuit for short to power

Pinpoint Tests

PINPOINT TEST A : LOSS OF COOLANT

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: VISUAL INSPECTION	
1	Visually inspect for loss of coolant.
2	Carry out a system pressure test. See component tests in this section.
	Is the engine cooling system leaking? Yes Rectify the leak as indicated by the test result. Top-up and fill the cooling system to the correct level with the correct specification fluid as necessary. REFER to: (303-03A Engine Cooling - TDV6 2.7L Diesel) Specifications (Specifications), Cooling System Draining, Filling and Bleeding (General Procedures). TEST the system for correct operation. No Verify the customer complaint.

PINPOINT TEST B : THE ENGINE OVERHEATS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
B1: CHECK COOLANT	
 WARNING: The cooling system is pressurized! Ensure the reservoir cap is never released until the system has cooled. Failure to follow these instructions may result in personal injury.	
1	Check the coolant level and condition.
	Does the system contain sufficient coolant of the correct specification? Yes GO to B2. No Top-up and fill the cooling system to the correct level with the correct specification fluid as necessary. REFER to: (303-03A Engine Cooling - TDV6 2.7L Diesel) Specifications (Specifications), Cooling System Draining, Filling and Bleeding (General Procedures). Check for coolant loss. GO to Pinpoint Test A.

B2: CHECK COOLANT EXPANSION TANK PRESSURE CAP

1	Check the coolant expansion tank pressure cap for damage/correct operation. REFER to the coolant expansion tank pressure cap pressure test in this section.
	Is the coolant expansion tank pressure cap operating correctly? Yes GO to B3. No INSTALL a new coolant expansion tank pressure cap. TEST the system for correct operation.

B3: CHECK THERMOSTAT

1	Check the thermostat for correct operation. REFER to the thermostat component test in this section.
----------	---

Is the thermostat operating correctly?

Yes

Check for correct operation of cooling fans, circuits, sensors, modules, etc.
REFER to: [Electronic Engine Controls - 2.7L Diesel \(303-14A, Diagnosis and Testing\)](#).

No

INSTALL a new thermostat.
REFER to: [Thermostat \(303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation\)](#).
TEST the system for correct operation.

PINPOINT TEST C : THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

TEST CONDITIONS

DETAILS/RESULTS/ACTIONS

C1: CHECK THERMOSTAT

1 Check the thermostat for correct operation. REFER to the thermostat component test in this section.

Is the thermostat operating correctly?

Yes

Check for correct operation of cooling fans, circuits, sensors, modules, etc.
REFER to: [Electronic Engine Controls - 2.7L Diesel \(303-14A, Diagnosis and Testing\)](#).

No

INSTALL a new thermostat.
REFER to: [Thermostat \(303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation\)](#).
TEST the system for correct operation.

Component Tests

Cooling System Pressure Test

WARNING: Never, under any circumstances, remove the coolant expansion tank pressure cap while the engine is operating. To avoid having scalding hot water or steam blow out of the cooling system, use extreme care when removing the coolant expansion tank pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant expansion tank pressure cap and turn it slowly until the pressure begins to release, step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant expansion tank pressure cap. Failure to follow these instructions may result in damage to the cooling system, engine and/or cause personal injury.

1. Switch the engine off.
2. Open the hood and install protective fender covers.
3. Carefully remove the coolant expansion tank pressure cap from the coolant expansion tank to relieve pressure in the cooling system. Add coolant to coolant expansion tank as necessary.
4. Install the pressure tester equipment to the cooling system following manufacturers instructions. Reinstall the coolant expansion tank pressure cap (if pressure test equipment is not installed to the coolant expansion tank).
5. Pressurize the cooling system to the coolant expansion tank pressure cap lower limit.
6. Observe the gauge reading for approximately two minutes. Pressure should not drop during this time.
 - If system holds pressure, continue from step 8.
 - If the pressure drops, check the complete cooling system for leaks. Also refer to engine system checks if a leak cannot be located in the cooling system. Correct any leaks found and recheck the system.
7. Release the system pressure and remove the pressure test equipment. Check the coolant level. Replenish as necessary with the correct coolant solution.
REFER to: [Specifications \(303-03A Engine Cooling - TDV6 2.7L Diesel, Specifications\)](#).
8. Check the radiator overflow hose for any obstructions which may block the flow of coolant either to or from the coolant expansion tank.
9. Conduct the coolant expansion tank pressure cap pressure test in this section.

Coolant Expansion Tank Pressure Cap Pressure Test

WARNING: Never, under any circumstances, remove the coolant expansion tank pressure cap while the engine is operating. To avoid having scalding hot water or steam blow out of the cooling system, use extreme care when removing the coolant expansion tank pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant expansion tank pressure cap and turn it slowly until the pressure begins to release, step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant expansion tank pressure cap. Failure to follow these instructions may result in damage to the cooling system, engine and/or cause personal injury.

1. Remove the expansion tank pressure cap from the coolant expansion tank.
2. Use water to clean cap in area of rubber seal and vacuum relief valve. Following manufacturers instructions, install the coolant expansion tank pressure cap to the pressure tester.
3. **NOTE:** If the pressure tester is pressurised too quickly, an erroneous pressure reading may result.
 3. Slowly pressurise the system until the pressure gauge reading stops increasing, and note highest pressure reading obtained.
4. Release pressure and repeat Step 3 at least twice to make sure the pressure test reading is repeatable and within specification.
5. If the pressure test gauge readings are not within specification, install a new coolant expansion tank pressure cap.

Thermostat Test

Remove the thermostat

REFER to: [Thermostat \(303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation\)](#).

Inspect for visible damage, note its opening temperature and immerse it in water. Heat the water until this temperature is reached. The thermostat should begin to open. If it does not begin to open, install a new thermostat.

REFER to: [Thermostat \(303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation\)](#).

If thermostat begins to open, continue to heat the water until the thermostat fully opens, 5.8 mm (0.2 in) or more off the seat. If it does not fully open, install a new thermostat.

REFER to: [Thermostat](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

Radiator Leak Test - Removed from the Vehicle

 **CAUTION:** Do not leak test an aluminium radiator in the same water that is used to leak test copper/brass radiators. Flux and caustic cleaners may be present in the test water which will corrode aluminium. If a separate tank is not available, drain and rinse the test tank before testing an aluminium radiator.

Clean the radiator before leak testing to prevent contamination of the test tank. Leak test the radiator in clean water with 138 kPa (20 psi) air pressure.

Engine Cooling - TDV6 2.7L Diesel - Cooling System Draining, Filling and Bleeding

General Procedures

• WARNINGS:

 Never remove the coolant expansion tank cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

 To avoid the possibility of personal injury, do not operate the engine with the hood open until the fan blades have been examined for cracks and separation. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage. Failure to follow this instruction may result in damage to the engine.

 Never remove the coolant expansion tank cap under any circumstances while the engine is operating. Failure to follow this instruction may result in damage to the engine.

-  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

-  **WARNING:** Release the cooling system pressure by slowly turning the coolant expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

Release the cooling system pressure.

- Remove the coolant expansion tank cap.

- Remove the radiator splash shield.
For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

- Drain the coolant.

- Position a container to collect the fluid.
- Remove the drain plug.

E36709

-  **CAUTION:** Do not over tighten the drain plug. Failure to follow this instruction may result in damage to the vehicle.

Install the drain plug.

- Remove the drain tray.

E36709

- Lower the vehicle.

7. Loosen the coolant expansion tank bleed screw.

8.  **CAUTION:** Anti-freeze concentration must be maintained at 50%.

Refill the cooling system.

- When coolant runs from the expansion tank bleed point bubble-free, tighten the bleed screw.
- Tighten to 3 Nm.

9. Set the heating to the COLD position.

10.  **WARNING:** Release the cooling system pressure by slowly turning the coolant expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

Set the ignition to the ON position.

11. After 3 minutes, set the heating system to the HOT position.
12. Maintain the coolant level in the coolant expansion tank at the MAX mark using a 50% mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and 50% water.
13. After 4 minutes, refit the coolant expansion tank pressure cap.
14. Start the engine and allow to idle for 5 minutes.
15. Raise the engine to 2500 RPM for 30 seconds.
16. Set the ignition to the OFF position.
17. Allow the engine to cool.
18. After 2 minutes, release the cooling system pressure.
 - Remove the coolant expansion tank pressure cap.

19. **NOTE:** Make sure the heating system is set to the HOT position.

Set the ignition to the ON position.

20. Maintain the coolant level in the coolant expansion tank at the MAX mark using a 50% mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and 50% water.
21. After 3 minutes, refit the coolant expansion tank pressure cap.
22. Drive the vehicle on the road at varying speeds until the engine reaches normal operating temperature.
23. Allow the engine to cool.
24. Release the cooling system pressure.
 - Remove the coolant expansion tank pressure cap.

25. Fill the cooling system up to the MAX mark on the coolant expansion tank using a 50% mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and 50% water.
26. Raise the vehicle.
27. Visually check the engine and cooling system for signs of coolant leakage.
28. Install the radiator splash shield.
For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

Engine Cooling - TDV6 2.7L Diesel - Coolant Expansion Tank

Removal and Installation

Removal

WARNING: To avoid having scalding hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

• **NOTE:** Some variation in the illustrations may occur, but the essential information is always correct.

1. **CAUTION:** Take extra care when releasing the vent hose, failure to follow this instruction may result in damage to the coolant expansion tank.

• **NOTE:** Cap the vent hose to minimize coolant loss.

Release the coolant expansion tank.

- Disconnect the vent hose.
- Remove the retaining bolt.
- Release the coolant expansion tank from its mountings for access.

2. Disconnect the coolant expansion tank low level sensor electrical connector.

3. **NOTE:** Make sure the retaining clip is not removed.

• **NOTE:** Cap the coolant expansion tank lower hose to minimize coolant loss.

Disconnect the coolant expansion tank lower hose.

- Remove the coolant expansion tank.

Installation

1. To install, reverse the removal procedure.

- Tighten the bolt to 3 Nm.

2. Fill the cooling system to the upper level mark of the coolant expansion tank.

Engine Cooling - TDV6 2.7L Diesel - Cooling Fan Motor and Shroud

Removal and Installation

Removal

1. Remove fuse F17 from the engine junction box (EJB).

- Remove the engine compartment fuse box cover.
- Remove the engine compartment fuse box inner cover.

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Remove the radiator splash shield.

For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

4. Remove the air deflector.

For additional information, refer to: [Air Deflector](#) (501-02, Removal and Installation).

5. Release and remove the cooling fan lower shroud from the cooling pack.

E97870

6. Disconnect the two electrical connectors from the cooling module wiring harness.

- Release the 2 electrical connectors from the clips.

E 50687

7. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Disconnect the auxillary coolant flow pump electrical connector

8. Release the A/C line from the cooling fan shroud.

9. Release the coolant hose from the cooling fan shroud.

10. Lower the vehicle.

11. Remove the air cleaner.

For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).

12. NOTE: Cap the vent hose to minimize coolant loss.

Release the coolant expansion tank.

- Release the vent hose.
- Remove the retaining bolt.
- Release the expansion tank from its mountings for access

13. Disconnect the coolant expansion tank low level sensor electrical connector.

14. Release the auxiliary coolant pump.

15. Release the coolant hose from the cooling fan shroud.

16. Remove the cooling fan motor and shroud securing bracket.

17. Remove the cooling fan motor and shroud retaining bolt

18. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the cooling fan motor and shroud.

- Reposition the wiring harness.

Installation

1. To install, reverse the removal procedure.

- Install the cooling fan motor and shroud retaining bolt.
- Tighten to 6 Nm.

2. Tighten to 6 Nm.

3. Tighten to 6 Nm.

Engine Cooling - TDV6 2.7L Diesel - Coolant Pump

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.
3. Remove the air cleaner.
For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).
4. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03B Engine Cooling - V6 3.0L Petrol, General Procedures).
5. Remove the accessory drive belt.
For additional information, refer to: [Accessory Drive Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).
6. Remove the coolant pump pulley.
 - Using a suitable 6mm bar, retain the coolant pump pulley.
 - Discard the bolts.

7. **NOTE:** Remove and discard the O-ring seal.

Remove the coolant pump.

Installation

1.  **CAUTION:** Make sure that the mating faces are clean and free of foreign material.
 - **NOTE:** Lubricate the O-ring seal with clean coolant.
- To install, reverse the removal procedure.
- Tighten to 10 Nm.

2. Tighten to 24 Nm.

E51066

Engine Cooling - TDV6 2.7L Diesel - Radiator

Removal and Installation

Removal

 **CAUTION:** Engine coolant will damage the paint finished surfaces. If spilled, immediately remove the coolant and clean the area with water.

1.  **WARNING:** Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Drain the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03B Engine Cooling - V6 3.0L Petrol, General Procedures).

3. Remove the cooling fan motor and shroud.

For additional information, refer to: [Cooling Fan Motor and Shroud](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

4. Disconnect the coolant top hose from the radiator.

E51069

5. Remove the air intake elbow pipe.

E51070

6. Detach the charge air cooler intake elbow.

E72146

7.  **CAUTION:** Be prepared to collect escaping coolant.

Disconnect the thermostat housing lower radiator hose.

- Release the retaining clip.

E51071

8. Disconnect the coolant hose.

E63697

9. Remove the radiator upper mountings.

E51072

10. Remove the right-hand A/C condenser retaining bolt.

E51062

11. Remove the left-hand A/C condenser retaining stud.

E72148

12. Tie the A/C condenser forwards, clear of the radiator.

13. With assistance, remove the radiator assembly.

14. Remove the foam insulation pads.

15. Remove the charge air cooler from the radiator.

1. Remove the charge air cooler retaining bolts.

Installation

1. To install, reverse the removal procedure.

- Tighten to 7 Nm.

E63764

2. Tighten to 7 Nm.

E72148

3. Tighten to 7 Nm.

E51062

4. Tighten to 7 Nm.

E51072

5. Tighten to 7 Nm.

Raise and support the vehicle.
3. Drain the cooling system.
For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).
4. Remove the air cleaner.
For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).
5. Detach the charge air cooler inlet hose.

6. Remove the charge air cooler inlet elbow.

7. Detach the coolant hoses.

8. Detach the transmission fluid cooler hose.

9. Remove the coolant expansion tank.
For additional information, refer to: [Coolant Expansion Tank](#) (303-03B Engine Cooling - V6 3.0L Petrol, Removal and Installation).

10. Detach the coolant hose.

11. Detach the thermostat and hose assembly.

12. Remove the thermostat and hose assembly.

Installation

1. Install the thermostat and hose assembly.

2. Attach the thermostat and hose assembly.

3. Attach the coolant hose.

4. Install the coolant expansion tank.

For additional information, refer to: [Coolant Expansion Tank](#) (303-03B Engine Cooling - V6 3.0L Petrol, Removal and Installation).

5. Attach the transmission fluid cooler hose.

6. Attach the coolant hoses.

7. Install the charge air cooler inlet elbow.

- Tighten to 7 Nm.

8. Attach the charge air cooler inlet hose.

9. Install the air cleaner.

For additional information, refer to: [Air Cleaner](#) (303-12A Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).

10. Refill the cooling system.

For additional information, refer to: [Cooling System Draining, Filling and Bleeding](#) (303-03A Engine Cooling - TDV6 2.7L Diesel, General Procedures).

11. Reconnect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

Engine Cooling - V6 3.0L Petrol - Engine Cooling - Overview

Description and Operation

Overview

The engine cooling system maintains the engine within an optimum temperature range under changing ambient and engine operating conditions. It also provides:

- Heating for:
 - The passenger compartment.
Refer to: [Heating and Ventilation](#) (412-01 Climate Control, Description and Operation).
 - The inlet manifold and throttle body.
- Cooling for:
 - The engine lubrication system.
 - The transmission lubrication system.
Refer to: [Transmission Cooling - Vehicles With: ZF 6HP26](#) (307-02 Transmission/Transaxle Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol/TDV6 2.7L Diesel, Description and Operation).

Engine Cooling - V6 3.0L Petrol - Engine Cooling - System Operation and Component Description

Description and Operation

System Operation

When the engine is running the coolant is circulated around the engine cooling system by the coolant pump. From the outlet of the coolant pump, coolant flows through the cylinder block and cylinder heads, then into the radiator upper hose. When the coolant is cold, the thermostat is closed and the coolant returns to the inlet of the coolant pump through the thermostat housing. When the coolant is warm, the thermostat is open and the coolant flows to the inlet of the coolant pump via the radiator, the radiator lower hose and the thermostat housing.

When the thermostat is open, the coolant flow through the radiator lower hose generates a coolant flow through the engine oil cooler.

The heater core and the inlet manifold/throttle body are on parallel circuits that are unaffected by the position of the thermostat. A constant flow of coolant is supplied to the heater core and the inlet manifold/throttle body from the radiator upper hose. The return flow from the inlet manifold/throttle body joins the supply to the heater core. From the heater core, the coolant returns to a dedicated inlet on the coolant pump. Expansion and contraction of the coolant is accommodated by the hose connection between the expansion tank and the heater return hose.

If the coolant level in the expansion tank decreases below a predetermined value, the level sensor connects a ground to the instrument cluster, which activates the appropriate warning.

Refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation).

The cooling fan is operated by a fan control module integrated into the cooling fan motor. The fan control module regulates the voltage, and thus speed, of the cooling fan motor in response to a **PWM (pulse width modulation)** signal from the **ECM (engine control module)**. The **ECM** calculates the required fan speed from the engine temperature, **A/C (air conditioning)** system pressure and transmission oil temperature.

Under hot operating conditions, the fan may continue to operate for four minutes after the engine has been switched off.

Refer to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - V6 3.0L Petrol, Description and Operation).

Engine Cooling Flow Diagram

1	Coolant pump
2	Throttle body
3	Inlet manifold
4	Engine
5	Heater core
6	Engine oil cooler
7	Thermostat
8	Radiator lower hose
9	Radiator
10	Coolant expansion tank
11	Radiator upper hose

Component Description

General

The primary components of the engine cooling system are the:

- Coolant pump.
- Thermostat.
- Radiator.
- Cooling fan.
- Expansion tank.
- Engine oil cooler.
- Connecting hoses and pipes.

The engine cooling system also supplies coolant to:

- The heater core.
Refer to: [Heating and Ventilation](#) (412-01 Climate Control, Description and Operation).
- The transmission oil cooler.
Refer to: [Transmission Cooling - Vehicles With: ZF 6HP26](#) (307-02 Transmission/Transaxle Cooling - V8 4.2L Petrol/V8 S/C 4.2L Petrol/V6 3.0L Petrol/TDV6 2.7L Diesel, Description and Operation).

In markets subject to very cold climatic conditions, an engine block heater is incorporated into the engine cooling system.

Coolant Pump

ItemDescription

1	Pulley
2	Outlet connection to cylinder block
3	Inlet connection from thermostat
4	Inlet connection from heater core

The coolant pump consists of a body that contains an impeller connected to a pulley at the rear of the body. Coolant inlet and outlet connections are incorporated into the body, which is attached to the front cover of the engine. The pulley is driven by the accessory drive belt.

Refer to: [Accessory Drive](#) (303-05 Accessory Drive - 3.0L, Description and Operation).

Thermostat

E97779

ItemDescription

1	Radiator upper hose connection
2	Coolant pump inlet hose connection
3	Thermostat
4	O-ring
5	Inlet connector
6	Bolt (2 off)
7	Radiator lower hose connection
8	Thermostat housing

The thermostat allows rapid engine warm-up, by restricting coolant flow through the radiator when the engine is cold, and helps to keep the engine operating temperature within predetermined limits. The thermostat is installed in a housing at the junction of the coolant pump inlet hose, the radiator lower hose and the radiator upper hose. The thermostat begins to open at 88 - 92 °C (190 - 198 °F) and is fully open at 102 °C (216 °F).

Radiator

E97780

ItemDescription

1	Locating spigot (2 off)
2	Coolant inlet
3	Support (2 off)
4	Coolant outlet
5	Transmission oil outlet
6	Drain plug
7	Transmission oil inlet

The radiator is a cross flow type with an aluminum core and plastic end tanks. The radiator is located in the vehicle by locating spigots and supports integrated into the end tanks. The supports are installed in rubber bushes in the upper chassis rails. The locating spigots are installed in rubber bushes in the front end carrier. The transmission oil cooler and a drain plug are integrated into the **LH (left-hand)** end tank. Coolant inlet and outlet connections are incorporated into the **RH (right-hand)** and **LH** end tanks respectively.

Cooling Fan

E97781

ItemDescription

1	Shroud
2	Electrical connectors
3	Fan
4	Motor and fan control module

An electric, variable speed cooling fan is installed in a shroud attached to the rear of the radiator. The cooling fan is operated by a fan control module, integrated into the electric motor, under the control of the [ECM](#). Two electrical connectors at the [RH](#) side of the shroud provide the interface between the cooling fan harness and the vehicle wiring.

Expansion Tank

E97783

ItemDescription

1	Filler cap
2	Bleed screw

3	Vent hose connection
4	Expansion hose connection
5	Level sensor
6	Level markings

A pressurized expansion tank system is used which continuously separates the air from the cooling system and replenishes the system through a hose connected between the expansion tank and the heater return hose. A continuous vent into the expansion tank, through a hose connected to the radiator upper hose, prevents air locks from forming in the cooling system.

The expansion tank is installed behind the top right corner of the radiator. A filler cap, bleed screw and level sensor are incorporated into the expansion tank. MAX and MIN level markings are molded into the interior of the tank below the filler cap. The expansion tank provides the following functions:

- Service fill.
- Coolant expansion during warm-up.
- Air separation during operation.
- System pressurization by the filler cap.

The expansion tank has an air space of approximately 0.5 to 1 liter (1.06 to 2,11 US pints), above the MAX level, to allow for coolant expansion.

Engine Oil Cooler

E97784

ItemDescription

1	Coolant outlet
2	Coolant inlet

The engine oil cooler is located on the [LH](#) side of the engine, on the oil filter adapter. Engine oil is cooled as it flows from the filter back to the cylinder block. The coolant supply and return hoses for the engine oil cooler are connected to a T insert in the radiator lower hose. A restrictor in the T insert, between the two oil cooler connections, induces the flow of coolant through the oil cooler.

Engine Block Heater

E97782

ItemDescription

1	110 V ac version
2	240 V ac version

For vehicle markets subject to very cold climatic conditions, an engine block heater is installed in place of the cylinder block drain plug. The engine block heater is either a 110 V ac or 240 V ac electric heater element, depending on the market, which can be connected to a domestic power supply via a connector in the lower center grill of the front bumper.

Engine Coolant

The engine coolant is formulated to last for ten years or 240,000 km (150,000 miles). The coolant is silicate free and must not be mixed with conventional engine coolant.

Engine Cooling - V6 3.0L Petrol - Engine Cooling

Diagnosis and Testing

Principles of Operation

For a detailed description of the petrol engine cooling system, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (303-03B Engine Cooling - V6 3.0L Petrol)

[Engine Cooling](#) (Description and Operation),

[Engine Cooling](#) (Description and Operation),

[Engine Cooling](#) (Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> Leaks Coolant expansion tank Electric fan Radiator 	<ul style="list-style-type: none"> Fuse Wiring harness Loose or corroded connector(s) Engine Coolant Temperature (ECT) sensor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If there are clear symptoms refer to the table below, alternatively, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Cause	Action
Coolant loss	<ul style="list-style-type: none"> Hoses Hose connections Radiator Coolant pump Heater core Gaskets Engine casting cracks Engine block core plugs 	<ul style="list-style-type: none"> GO to Pinpoint Test A.
Engine overheating	<ul style="list-style-type: none"> Engine coolant (level/condition) Thermostat Fan motor Fan motor fuses and/or circuits ECT sensor Engine control module (ECM) Fan speed module 	<ul style="list-style-type: none"> GO to Pinpoint Test B.
Engine not reaching normal operating temperature	<ul style="list-style-type: none"> Thermostat Electric fan Fan speed module 	<ul style="list-style-type: none"> GO to Pinpoint Test C.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: If the module or a component is suspect and the vehicle remains under the Manufacturers warranty, refer to the Warranty Policy and Procedure manual (section B1.2), or determine if any prior approval programme is in operation, prior to the Check and installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action
P011623	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	<ul style="list-style-type: none"> Low coolant level ECT sensor sensing circuit - intermittent high resistance Engine thermostat failure ECT sensor failure 	Fill cooling system to correct level and specification. Pinpoint Tests

PINPOINT TEST A : LOSS OF COOLANT

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
A1: VISUAL INSPECTION	
	<ol style="list-style-type: none"> Visually inspect for loss of coolant. Carry out a system pressure test. See component tests in this section.
Is the engine cooling system leaking?	<p>Yes</p> <p>Rectify the leak as indicated by the test result. Top-up and fill the cooling system to the correct level with the correct specification fluid as necessary. REFER to: (303-03B Engine Cooling - V6 3.0L Petrol) Specifications (Specifications), Cooling System Draining, Filling and Bleeding (General Procedures).</p> <p>TEST the system for correct operation.</p> <p>No</p> <p>Verify the customer complaint.</p>

PINPOINT TEST B : THE ENGINE OVERHEATS

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
-----------------	-------------------------

B1: CHECK COOLANT

WARNING: The cooling system is pressurized! Ensure the reservoir cap is never released until the system has cooled. Failure to follow these instructions may result in personal injury.

1 Check the coolant level and condition.

Does the system contain sufficient coolant of the correct specification?

Yes

[GO to B2.](#)

No

Top-up and fill the cooling system to the correct level with the correct specification fluid as necessary. REFER to: (303-03B Engine Cooling - V6 3.0L Petrol)

[Specifications](#) (Specifications),

[Cooling System Draining, Filling and Bleeding](#) (General Procedures).

Check for coolant loss. GO to Pinpoint Test [A](#).

B2: CHECK COOLANT EXPANSION TANK PRESSURE CAP

1 Check the coolant expansion tank pressure cap for damage/correct operation. REFER to the coolant expansion tank pressure cap pressure test in this section.

Is the coolant expansion tank pressure cap operating correctly?

Yes

[GO to B3.](#)

No

INSTALL a new coolant expansion tank pressure cap. TEST the system for correct operation.

B3: CHECK THERMOSTAT

1 Check the thermostat for correct operation. REFER to the thermostat component test in this section.

Is the thermostat operating correctly?

Yes

Check for correct operation of cooling fans, circuits, sensors, modules, etc.

REFER to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - V6 3.0L Petrol, Diagnosis and Testing).

No

INSTALL a new thermostat.

REFER to: [Thermostat](#) (303-03B Engine Cooling - V6 3.0L Petrol, Removal and Installation).

TEST the system for correct operation.

PINPOINT TEST C : THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE**TEST CONDITIONS****DETAILS/RESULTS/ACTIONS****C1: CHECK THERMOSTAT**

1 Check the thermostat for correct operation. REFER to the thermostat component test in this section.

Is the thermostat operating correctly?

Yes

Check for correct operation of cooling fans, circuits, sensors, modules, etc.

REFER to: [Electronic Engine Controls](#) (303-14B Electronic Engine Controls - V6 3.0L Petrol, Diagnosis and Testing).

No

INSTALL a new thermostat.

REFER to: [Thermostat](#) (303-03B Engine Cooling - V6 3.0L Petrol, Removal and Installation).

TEST the system for correct operation.

Component Tests**Cooling System Pressure Test**

WARNING: Never, under any circumstances, remove the coolant expansion tank pressure cap while the engine is operating. To avoid having scalding hot water or steam blow out of the cooling system, use extreme care when removing the coolant expansion tank pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant expansion tank pressure cap and turn it slowly until the pressure begins to release, step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant expansion tank pressure cap. Failure to follow these instructions may result in damage to the cooling system, engine and/or cause personal injury.

1. **1.** Switch the engine off.
2. **2.** Open the hood and install protective fender covers.
3. **3.** Carefully remove the coolant expansion tank pressure cap from the coolant expansion tank to relieve pressure in the cooling system. Add coolant to coolant expansion tank as necessary.
4. **4.** Install the pressure tester equipment to the cooling system following manufacturers instructions. Reinstall the coolant expansion tank pressure cap (if pressure test equipment is not installed to the coolant expansion tank).
5. **5.** Pressurize the cooling system to the coolant expansion tank pressure cap lower limit.
6. **6.** Observe the gauge reading for approximately two minutes. Pressure should not drop during this time.
 - If system holds pressure, continue from step 8.
 - If the pressure drops, check the complete cooling system for leaks. Also refer to engine system checks if a leak cannot be located in the cooling system. Correct any leaks found and recheck the system.
7. **7.** Release the system pressure and remove the pressure test equipment. Check the coolant level. Replenish as necessary with the correct coolant solution.
REFER to: [Specifications](#) (303-03B Engine Cooling - V6 3.0L Petrol, Specifications).
8. **8.** Check the radiator overflow hose for any obstructions which may block the flow of coolant either to or from the coolant expansion tank.
9. **9.** Conduct the coolant expansion tank pressure cap pressure test in this section.

Coolant Expansion Tank Pressure Cap Pressure Test

WARNING: Never, under any circumstances, remove the coolant expansion tank pressure cap while the engine is operating. To avoid having scalding hot water or steam blow out of the cooling system, use extreme care when removing the coolant expansion tank pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant expansion tank pressure cap

and turn it slowly until the pressure begins to release, step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant expansion tank pressure cap. Failure to follow these instructions may result in damage to the cooling system, engine and/or cause personal injury.

1. Remove the expansion tank pressure cap from the coolant expansion tank.
2. Use water to clean cap in area of rubber seal and vacuum relief valve. Following manufacturers instructions, install the coolant expansion tank pressure cap to the pressure tester.
3. • NOTE: If the pressure tester is pressurised too quickly, an erroneous pressure reading may result.
 3. Slowly pressurise the system until the pressure gauge reading stops increasing, and note highest pressure reading obtained.
4. Release pressure and repeat Step 3 at least twice to make sure the pressure test reading is repeatable and within specification.
5. If the pressure test gauge readings are not within specification, install a new coolant expansion tank pressure cap.

Thermostat Test

Remove the thermostat

REFER to: [Thermostat](#) (303-03B Engine Cooling - V6 3.0L Petrol, Removal and Installation).

Inspect for visible damage, note its opening temperature and immerse it in water. Heat the water until this temperature is reached. The thermostat should begin to open. If it does not begin to open, install a new thermostat.

REFER to: [Thermostat](#) (303-03B Engine Cooling - V6 3.0L Petrol, Removal and Installation).

If thermostat begins to open, continue to heat the water until the thermostat fully opens, 5.8 mm (0.2 in) or more off the seat. If it does not fully open, install a new thermostat.

REFER to: [Thermostat](#) (303-03B Engine Cooling - V6 3.0L Petrol, Removal and Installation).

Radiator Leak Test - Removed from the Vehicle

CAUTION: Do not leak test an aluminium radiator in the same water that is used to leak test copper/brass radiators. Flux and caustic cleaners may be present in the test water which will corrode aluminium. If a separate tank is not available, drain and rinse the test tank before testing an aluminium radiator.

Clean the radiator before leak testing to prevent contamination of the test tank. Leak test the radiator in clean water with 138 kPa (20 psi) air pressure.

Engine Cooling - V6 3.0L Petrol - Cooling System Draining, Filling and Bleeding

General Procedures

• WARNINGS:

 Never remove the coolant expansion tank cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

 To avoid the possibility of personal injury, do not operate the engine with the hood open until the fan blades have been examined for cracks and separation. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage. Failure to follow this instruction may result in damage to the engine.

 Never remove the coolant expansion tank cap under any circumstances while the engine is operating. Failure to follow this instruction may result in damage to the engine.

All vehicles

-  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

-  **WARNING:** Release the cooling system pressure by slowly turning the coolant expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

Release the cooling system pressure.

- Remove the coolant expansion tank cap.

- Remove the radiator splash shield.
For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

- Drain the coolant.

- Position a container to collect the fluid.
- Remove the drain plug.

All vehicles

-  **CAUTION:** Do not over tighten the drain plug. Failure to follow this instruction may result in damage to the vehicle.

Install the drain plug.

- Remove the drain tray.

- Lower the vehicle.

Vehicles without supercharger

7. Loosen the cooling system bleed screw.

Vehicles with supercharger

8. NOTE: Position cloth to collect fluid spillage.

Loosen the cooling system bleed screw.

Vehicles without supercharger

9.  CAUTION: Anti-freeze concentration must be maintained at 50%.

Refill the cooling system.

- When coolant runs from the expansion tank bleed point bubble-free, tighten the bleed screw.

Vehicles with supercharger

10.  CAUTION: Anti-freeze concentration must be maintained at 50%.

Refill the cooling system.

- When coolant runs from the expansion tank bleed point bubble-free, tighten the bleed screw.

All vehicles

11. Install the coolant expansion tank cap.

12.  CAUTION: Do not RUN the engine with the coolant expansion tank pressure cap removed. Failure to follow this instruction may cause damage to the vehicle.

Start and run the engine.

13. Set the heating system to MAX heat, the blower motor to MAX speed and the air distribution to the instrument panel registers.

14.  **CAUTION:** Observe the engine temperature warning light. If the warning light is displayed, switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle

Allow the engine to run until hot air is emitted from the instrument panel registers, while observing the engine temperature warning light.

15. Switch the engine off.

16. Allow the engine to cool.

17. Release the cooling system pressure.

- Remove the coolant expansion tank pressure cap.

18. Maintain the coolant level in the coolant expansion tank at the MAX mark using a 50% mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and 50% water.

19. Install the coolant expansion tank pressure cap.

20. Raise the vehicle.

21. Install the radiator splash shield.

For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

Engine Cooling - V6 3.0L Petrol - Coolant Expansion Tank

Removal and Installation

Removal

- NOTE: Removal steps in this procedure may contain installation details.

4. Remove the air cleaner outlet pipe.
For additional information, refer to: [Air Cleaner Outlet Pipe](#) (303-12, Removal and Installation).
5. Remove the thermostat housing.

6. Remove the thermostat.
 - Remove and discard the O-ring seal.

Installation

1. To install, reverse the removal procedure.
 - Install a new O-ring seal.
 - Tighten to 10 Nm.

2. **NOTE:** For NAS vehicles only.

If required, carry out a long drive cycle.
For additional information, refer to: [Powertrain Control Module \(PCM\) Long Drive Cycle Self-Test](#) (303-14C, General Procedures).

Engine Cooling - V6 3.0L Petrol - Radiator

Removal and Installation

Removal

All vehicles

1. Remove the cooling fan motor and shroud.
For additional information, refer to [Cooling Fan Motor and Shroud](#) in this section.

Vehicles with automatic transmission

2. Detach the transmission oil cooler inlet and return pipes.
 - Remove and discard the O-ring seals.
 - Cap the oil cooler inlet and return pipes and the oil cooler.

3. Detach the lower coolant hose.

Vehicles with manual transmission

4. Detach the lower coolant hose.

All Vehicles

5. Disconnect the front crash sensor.

6. Detach the wiring harness.

7. Detach the radiator seal.

- Left-hand shown, right-hand similar.
- Remove the double-sided adhesive tape.

8. Raise the vehicle.

9. Remove the radiator lower cowl.

Vehicles with supercharger

10. Remove the water pump. For additional information, refer to Section [303-03A Engine Cooling](#) / [303-03B Engine Cooling](#) / [303-03C Engine Cooling](#) / [303-03D Supercharger Cooling](#).

11. Remove the water pump retaining bracket.

1. Remove the retaining bolt.
2. Remove the water pump retaining bracket.

12. Remove the cooling module retaining bolt.

13. Remove the cooling module retaining bolt.

- Secure the supercharger cooling radiator, condenser core and engine oil cooler using suitable retaining straps.

Vehicles without supercharger

14. NOTE: Left-hand shown, right-hand similar.

Detach the power steering oil cooler.

15. NOTE: Left-hand shown, right-hand similar.

Remove the condenser core retaining stud.

- Secure the condenser core and PAS cooler using suitable retaining straps.

All vehicles

16. Lower the vehicle.

17.  CAUTION: Make sure that the radiator is not damaged when removed.

Remove the radiator.

Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Engine Cooling - Overview

Description and Operation

Overview

The engine cooling system maintains the engine within an optimum temperature range under changing ambient and engine operating conditions. It also provides:

- Heating for:
 - The passenger compartment.
Refer to: [Heating and Ventilation](#) (412-01 Climate Control, Description and Operation).
 - The throttle body.
- Cooling for:
 - The engine lubrication system.
 - The transmission lubrication system.
Refer to: [Transmission Cooling - Vehicles With: ZF 6HP26](#) (307-02 Transmission/Transaxle Cooling - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).
 - The [EGR \(exhaust gas recirculation\)](#) valve.
Refer to: [Engine Emission Control](#) (303-08 Engine Emission Control - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Engine Cooling - System Operation and Component Description

Description and Operation

System Operation

General

When the engine is running, the coolant is circulated around the engine cooling system by the coolant pump and the auxiliary coolant pump. From the outlet of the coolant pump, coolant flows through the cylinder block and cylinder heads, then into the outlet assembly. When the coolant is cold, the thermostat is closed and the coolant flows direct from the outlet assembly back to the coolant pump. When the coolant is warm, the thermostat is open and the coolant flows from the outlet assembly to the inlet of the coolant pump via the radiator upper hose, radiator, radiator lower hose and thermostat.

On vehicles without supercharger, when the thermostat is open, the coolant flow through the radiator lower hose generates a coolant flow through the engine oil cooler.

The [EGR \(exhaust gas recirculation\)](#) valve/throttle body and the heater core are on parallel circuits that are unaffected by the position of the thermostat. A constant flow of coolant is supplied to the [EGR](#) valve/throttle body from the outlet assembly. From the throttle body the coolant flows back to a dedicated inlet connection of the coolant pump. A constant flow of coolant is supplied to the heater core from the radiator upper hose. From the heater core outlet, the coolant flows back to the inlet of the coolant pump via the auxiliary coolant pump.

Refer to: [Heating and Ventilation](#) (412-01 Climate Control, Description and Operation).

Expansion and contraction of the coolant is accommodated by the hose connection between the expansion tank and the heater return hose.

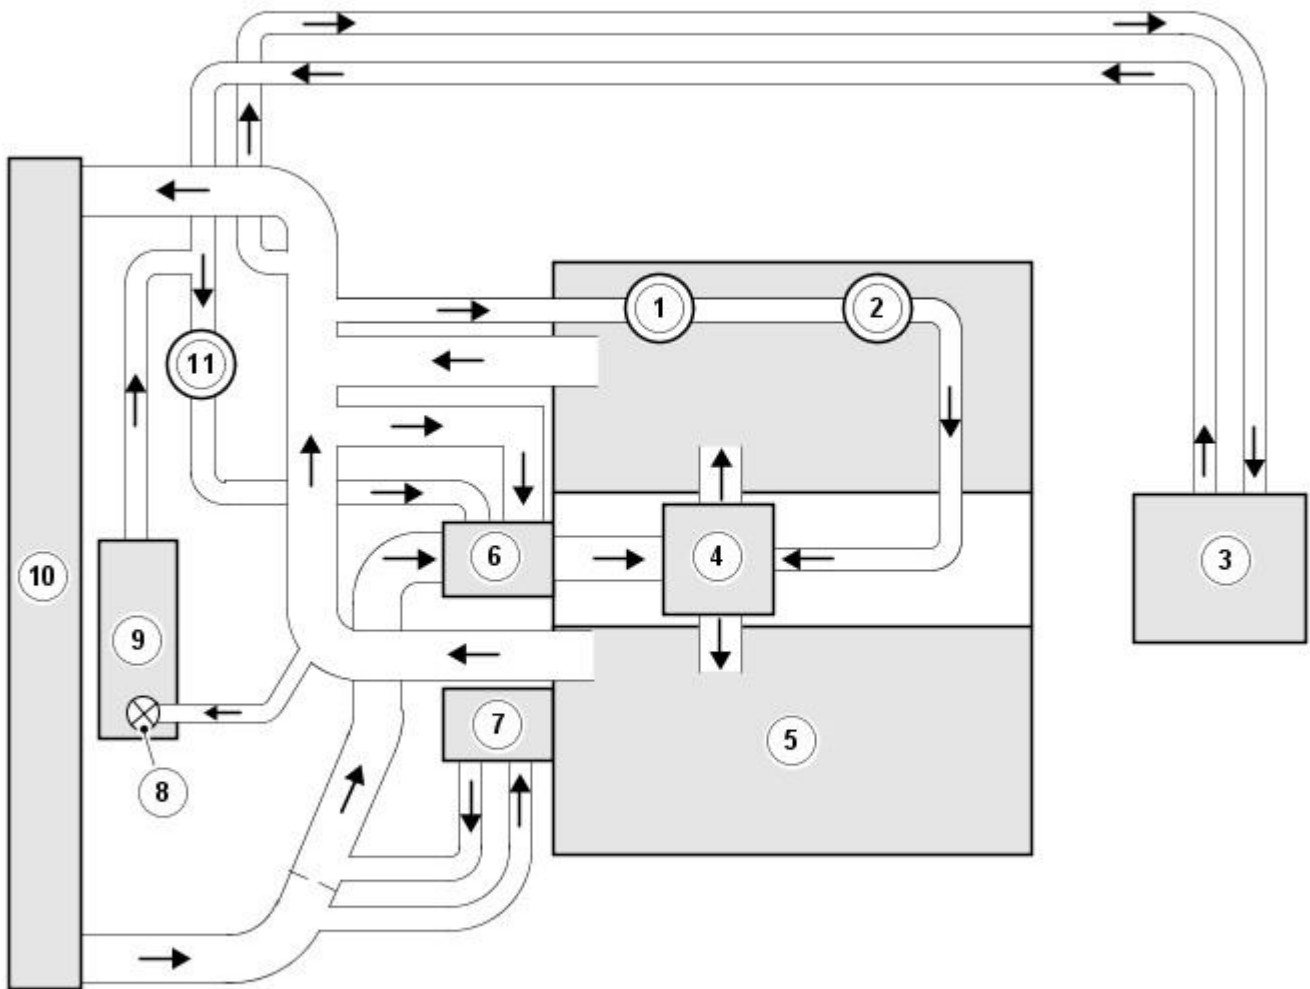

If the coolant level in the expansion tank decreases below a predetermined value, the level sensor connects a ground to the instrument cluster, which activates the appropriate warning.

Refer to: [Instrument Cluster](#) (413-01 Instrument Cluster, Description and Operation).

The cooling fan is operated by a fan control module integrated into the cooling fan motor. The fan control module regulates the voltage, and thus speed, of the cooling fan motor in response to a [PWM \(pulse width modulation\)](#) signal from the [ECM \(engine control module\)](#). The [ECM](#) calculates the required fan speed from the engine temperature, [A/C \(air conditioning\)](#) system pressure and transmission oil temperature. Under hot operating conditions, the fan may continue to operate for four minutes after the engine has been switched off.

Refer to: [Electronic Engine Controls](#) (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

10	Auxiliary coolant pump

Component Description

General

The primary components of the engine cooling system are the:

- Coolant pump.
- Thermostat.
- Radiator.

- Cooling fan.
- Expansion tank.
- Engine oil cooler.
- Connecting hoses and pipes.

The engine cooling system also supplies coolant to:

- The heater core.
Refer to: [Heating and Ventilation](#) (412-01 Climate Control, Description and Operation).
- The EGR cooler.
Refer to: [Engine Emission Control](#) (303-08 Engine Emission Control - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).
- The transmission oil cooler (vehicles without supercharger only).
Refer to: [Transmission Cooling - Vehicles With: ZF 6HP26](#) (307-02 Transmission/Transaxle Cooling - 2.7L V6 - TdV6/3.0L NA V6 - AJ27/4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation).

In markets subject to very cold climatic conditions, an engine block heater is incorporated into the engine cooling system.

Coolant Pump

E98066

ItemDescription

1	Drive hub
2	Adapter
3	Gasket
4	Pump body
5	Bolt (2 off)
6	Pulley
7	Bolt (3 off)
8	Impeller

The coolant pump has a body that supports a shaft with an impeller attached to one end and a drive hub at the other. The body is attached to the front of the cylinder block with an adapter, which encloses the impeller to form the pumping chamber. The pump is driven by a pulley attached to the drive hub and driven by the accessory drive belt. Refer to: [Accessory Drive](#) (303-05 Accessory Drive - 4.2L, Description and Operation).

Thermostat (Vehicles Without Supercharger)

E98067

ItemDescription

1	Outlet pipe
2	Seal
3	Thermostat
4	Thermostat cover
5	Bolt (3 off)

Thermostat (Vehicles With Supercharger)

E98068

ItemDescription

1	Seal
2	Thermostat cover
3	Bolt (3 off)
4	Thermostat
5	Outlet pipe

The thermostat is located in the outlet assembly, under the thermostat cover, and allows rapid engine warm-up by restricting coolant flow through the radiator when the engine is cold. The thermostat also assists in keeping the engine operating temperature within predetermined limits. On vehicles without supercharger, the thermostat begins to open at 88 - 92 °C (190 - 198 °F) and is fully open at 102 °C (216 °F). On vehicles with supercharger, the thermostat begins to open at 84 °C (183 °F) and is fully open at 98 °C (208 °F).

Radiator

E97780

ItemDescription

1	Locating spigot (2 off)
2	Coolant inlet
3	Support (2 off)
4	Drain plug
5	Transmission oil outlet
6	Coolant outlet
7	Transmission oil inlet

The radiator is a cross flow type with an aluminum core and plastic end tanks. The radiator is located in the vehicle by locating spigots and supports integrated into the end tanks. The supports are installed in rubber bushes in the upper chassis rails. The locating spigots are installed in rubber bushes in the front end carrier. The transmission oil cooler and a drain plug are integrated into the **LH (left-hand)** end tank. Coolant inlet and outlet connections are incorporated into the **RH (right-hand)** and **LH** end tanks respectively.

Cooling Fan

E97781

ItemDescription

1	Shroud
2	Electrical connectors
3	Fan
4	Motor and fan control module

An electric, variable speed cooling fan is installed in a shroud attached to the rear of the radiator. The cooling fan is operated by a fan control module, integrated into the electric motor, under the control of the [ECM](#). Two electrical connectors at the [RH](#) side of the shroud provide the interface between the cooling fan harness and the vehicle wiring.

Expansion Tank (Vehicles Without Supercharger)

ItemDescription

1	Filler cap
2	Bleed screw
3	Vent hose connection
4	Expansion hose connection
5	Level sensor
6	Level markings

Expansion Tank (Vehicles With Supercharger)

E98070

ItemDescription

1	Filler cap
2	Vent hose connection
3	Expansion hose connection
4	Level sensor

A pressurized coolant expansion tank system is used, which continuously separates the air from the cooling system and replenishes the system through a hose connected between the expansion tank and the heater return hose. A continuous vent into the expansion tank, through a hose connected to the outlet assembly, prevents air locks from forming in the cooling system.

On vehicles without supercharger, the expansion tank is installed behind the top right corner of the radiator. A filler cap, bleed screw and level sensor are incorporated into the expansion tank. MAX and MIN level markings are molded into the interior of the tank below the filler cap

On vehicles with supercharger, the expansion tank is installed on the [LH](#) front upper suspension housing. A filler cap and level sensor are incorporated into the expansion tank. A MAX level marking is molded into the interior of the tank below the filler cap. Cold fill levels are molded onto the exterior of the tank.

On all vehicles, the expansion tank provides the following functions:

- Service fill.
- Coolant expansion during warm-up.
- Air separation during operation.
- System pressurization by the filler cap.

The expansion tank has an air space of approximately 0.5 to 1 liter (1.06 to 2,11 US pints), above the MAX level, to allow for coolant expansion.

Engine Oil Cooler (Vehicles Without Supercharger Only)

E98069

ItemDescription

- | | |
|---|---------------------------|
| 1 | Coolant outlet connection |
| 2 | coolant inlet connection |

The engine oil cooler is installed at the front of the engine sump, between the engine oil filter head and the engine oil filter. Engine oil is cooled as it flows back to the filter head from the filter. The coolant supply and return hoses for the engine oil cooler are connected to a T insert in the radiator lower hose. A restrictor in the T insert, between the two oil cooler connections, induces the flow of coolant through the oil cooler.

- NOTE: On vehicles with supercharger, there are two air cooled engine oil coolers.

Engine Block Heater

E97782

ItemDescription

- | | |
|---|------------------|
| 1 | 110 V ac version |
| 2 | 240 V ac version |

For vehicle markets subject to very cold climatic conditions, an engine block heater is installed in place of the cylinder block drain plug. The engine block heater is either a 110 V ac or 240 V ac electric heater element, depending on the market, which can be connected to a domestic power supply via a connector in the lower center grill of the front bumper.

Engine Coolant

The engine coolant is formulated to last for ten years or 240,000 km (150,000 miles). The coolant is silicate free and must not be mixed with conventional engine coolant.

Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Engine Cooling

Diagnosis and Testing

Principles of Operation

For a detailed description of the petrol engine cooling system, refer to the relevant Description and Operation sections in the workshop manual. REFER to:

[Engine Cooling](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation),
[Engine Cooling](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation),
[Engine Cooling](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Description and Operation),
[Supercharger Cooling](#) (303-03B Supercharger Cooling - 4.2L SC V8 - AJV8, Description and Operation),
[Supercharger Cooling](#) (303-03B Supercharger Cooling - 4.2L SC V8 - AJV8, Description and Operation),
[Supercharger Cooling](#) (303-03B Supercharger Cooling - 4.2L SC V8 - AJV8, Description and Operation).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of damage and system integrity.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Leaks ● Coolant expansion tank ● Electric fan ● Radiator 	<ul style="list-style-type: none"> ● Fuse ● Wiring harness ● Loose or corroded connector(s) ● Engine Coolant Temperature (ECT) sensor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If there are clear symptoms refer to the table below, alternatively, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

Symptom Chart

Symptom	Possible Cause	Action
Coolant loss	<ul style="list-style-type: none"> ● Hoses ● Hose connections ● Radiator ● Coolant pump ● Heater core ● Gaskets ● Engine casting cracks ● Engine block core plugs 	<ul style="list-style-type: none"> ● GO to Pinpoint Test A.
Engine overheating	<ul style="list-style-type: none"> ● Engine coolant (level/condition) ● Thermostat ● Fan motor ● Fan motor fuses and/or circuits ● ECT sensor ● Engine control module (ECM) ● Fan speed module 	<ul style="list-style-type: none"> ● GO to Pinpoint Test B.
Engine not reaching normal operating temperature	<ul style="list-style-type: none"> ● Thermostat ● Electric fan ● Fan speed module 	<ul style="list-style-type: none"> ● GO to Pinpoint Test C.

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00.

• NOTE: If the module or a component is suspect and the vehicle remains under the Manufacturers warranty, refer to the Warranty Policy and Procedure manual (section B1.2), or determine if any prior approval programme is in operation, prior to the Check and installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
C1: CHECK THERMOSTAT	
	1 Check the thermostat for correct operation. REFER to the thermostat component test in this section.
	Is the thermostat operating correctly? Yes Check for correct operation of cooling fans, circuits, sensors, modules, etc. REFER to: Electronic Engine Controls (303-14 Electronic Engine Controls - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Diagnosis and Testing). No INSTALL a new thermostat. REFER to: (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8) Thermostat - 4.2L SC V8 - AJV8 (Removal and Installation), Thermostat - 4.2L NA V8 - AJV8 (Removal and Installation). TEST the system for correct operation.

Component Tests

Cooling System Pressure Test

WARNING: Never, under any circumstances, remove the coolant expansion tank pressure cap while the engine is operating. To avoid having scalding hot water or steam blow out of the cooling system, use extreme care when removing the coolant expansion tank pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant expansion tank pressure cap and turn it slowly until the pressure begins to release, step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant expansion tank pressure cap. Failure to follow these instructions may result in damage to the cooling system, engine and/or cause personal injury.

1. **1.** Switch the engine off.
2. **2.** Open the hood and install protective fender covers.
3. **3.** Carefully remove the coolant expansion tank pressure cap from the coolant expansion tank to relieve pressure in the cooling system. Add coolant to coolant expansion tank as necessary.
4. **4.** Install the pressure tester equipment to the cooling system following manufacturers instructions. Reinstall the coolant expansion tank pressure cap (if pressure test equipment is not installed to the coolant expansion tank).
5. **5.** Pressurize the cooling system to the coolant expansion tank pressure cap lower limit.
6. **6.** Observe the gauge reading for approximately two minutes. Pressure should not drop during this time.
 - If system holds pressure, continue from step 8.
 - If the pressure drops, check the complete cooling system for leaks. Also refer to engine system checks if a leak cannot be located in the cooling system. Correct any leaks found and recheck the system.
7. **7.** Release the system pressure and remove the pressure test equipment. Check the coolant level. Replenish as necessary with the correct coolant solution. REFER to:
 - [Specifications](#) (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8, Specifications),
 - [Specifications](#) (303-03B Supercharger Cooling - 4.2L SC V8 - AJV8, Specifications).
8. **8.** Check the radiator overflow hose for any obstructions which may block the flow of coolant either to or from the coolant expansion tank.
9. **9.** Conduct the coolant expansion tank pressure cap pressure test in this section.

Coolant Expansion Tank Pressure Cap Pressure Test

WARNING: Never, under any circumstances, remove the coolant expansion tank pressure cap while the engine is operating. To avoid having scalding hot water or steam blow out of the cooling system, use extreme care when removing the coolant expansion tank pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant expansion tank pressure cap and turn it slowly until the pressure begins to release, step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant expansion tank pressure cap. Failure to follow these instructions may result in damage to the cooling system, engine and/or cause personal injury.

1. **1.** Remove the expansion tank pressure cap from the coolant expansion tank.
2. **2.** Use water to clean cap in area of rubber seal and vacuum relief valve. Following manufacturers instructions, install the coolant expansion tank pressure cap to the pressure tester.
3. **• NOTE:** If the pressure tester is pressurised too quickly, an erroneous pressure reading may result.

3. Slowly pressurise the system until the pressure gauge reading stops increasing, and note highest pressure reading obtained.
4. 4. Release pressure and repeat Step 3 at least twice to make sure the pressure test reading is repeatable and within specification.
5. 5. If the pressure test gauge readings are not within specification, install a new coolant expansion tank pressure cap.

Thermostat Test

Remove the thermostat REFER to: (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8)

[Thermostat - 4.2L SC V8 - AJV8](#) (Removal and Installation),

[Thermostat - 4.2L NA V8 - AJV8](#) (Removal and Installation).

Inspect for visible damage, note its opening temperature and immerse it in water. Heat the water until this temperature is reached. The thermostat should begin to open. If it does not begin to open, install a new thermostat. REFER to: (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8)

[Thermostat - 4.2L SC V8 - AJV8](#) (Removal and Installation),

[Thermostat - 4.2L NA V8 - AJV8](#) (Removal and Installation).

If thermostat begins to open, continue to heat the water until the thermostat fully opens, 5.8 mm (0.2 in) or more off the seat. If it does not fully open, install a new thermostat. REFER to: (303-03A Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8)

[Thermostat - 4.2L SC V8 - AJV8](#) (Removal and Installation),

[Thermostat - 4.2L NA V8 - AJV8](#) (Removal and Installation).

Radiator Leak Test - Removed from the Vehicle

CAUTION: Do not leak test an aluminium radiator in the same water that is used to leak test copper/brass radiators. Flux and caustic cleaners may be present in the test water which will corrode aluminium. If a separate tank is not available, drain and rinse the test tank before testing an aluminium radiator.

Clean the radiator before leak testing to prevent contamination of the test tank. Leak test the radiator in clean water with 138 kPa (20 psi) air pressure.

Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Cooling System Draining, Filling and Bleeding

General Procedures

• WARNINGS:

Never remove the coolant expansion tank cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

To avoid the possibility of personal injury, do not operate the engine with the hood open until the fan blades have been examined for cracks and separation. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage. Failure to follow this instruction may result in damage to the engine.

Never remove the coolant expansion tank cap under any circumstances while the engine is operating. Failure to follow this instruction may result in damage to the engine.

All vehicles

1. **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

2. **WARNING:** Release the cooling system pressure by slowly turning the coolant expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

Release the cooling system pressure.

- Remove the coolant expansion tank cap.

3. Remove the radiator splash shield.

For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

4. Drain the coolant.

- Position a container to collect the fluid.
- Remove the drain plug.

All vehicles

5.  **CAUTION:** Do not over tighten the drain plug. Failure to follow this instruction may result in damage to the vehicle.

Install the drain plug.

- Remove the drain tray.

6. Lower the vehicle.

Vehicles without supercharger

7. Loosen the cooling system bleed screw.

Vehicles with supercharger

8. **NOTE:** Position cloth to collect fluid spillage.

Loosen the cooling system bleed screw.

Vehicles without supercharger

9.  **CAUTION:** Anti-freeze concentration must be maintained at 50%.

Refill the cooling system.

- When coolant runs from the expansion tank bleed point bubble-free, tighten the bleed screw.

Vehicles with supercharger

10.  CAUTION: Anti-freeze concentration must be maintained at 50%.

Refill the cooling system.

- When coolant runs from the expansion tank bleed point bubble-free, tighten the bleed screw.

All vehicles

11. Install the coolant expansion tank cap.

12.  CAUTION: Do not RUN the engine with the coolant expansion tank pressure cap removed. Failure to follow this instruction may cause damage to the vehicle.

Start and run the engine.

13. Set the heating system to MAX heat, the blower motor to MAX speed and the air distribution to the instrument panel registers.

14.  CAUTION: Observe the engine temperature warning light. If the warning light is displayed, switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle

Allow the engine to run until hot air is emitted from the instrument panel registers, while observing the engine temperature warning light.

15. Switch the engine off.

16. Allow the engine to cool.

17. Release the cooling system pressure.

- Remove the coolant expansion tank pressure cap.

18. Maintain the coolant level in the coolant expansion tank at the MAX mark using a 50% mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and 50% water.

19. Install the coolant expansion tank pressure cap.

20. Raise the vehicle.

21. Install the radiator splash shield.

For additional information, refer to: [Radiator Splash Shield](#) (501-02 Front End Body Panels, Removal and Installation).

Engine Cooling - 4.2L NA V8 - AJV8/4.2L SC V8 - AJV8 - Coolant Expansion Tank

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. Raise and support the vehicle.
2. For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03, General Procedures).

3.  CAUTION: Take extra care when handling the component.

• NOTE: Cap the vent hose to minimize coolant loss.

4.

5. NOTE: Cap the coolant expansion tank lower hose to minimize coolant loss.

6. TORQUE: 3 Nm

Installation

1. Install is the reverse of removal.

Removal

• WARNINGS:

 Never remove the coolant expansion tank cap under any circumstances while the engine is operating. Failure to follow this instruction may result in personal injury.

 To avoid the possibility of personal injury, do not operate the engine with the hood open until the fan blades have been examined for cracks and separation. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage. Failure to follow this instruction may result in damage to the engine.

 Never remove the coolant expansion tank cap under any circumstances while the engine is operating. Failure to follow this instruction may result in damage to the engine.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Remove the engine cover. For additional information, refer to: [Engine Cover - 4.2L SC V8 - AJV8](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

2.

3.

4. NOTE: Position cloth to collect fluid spillage.

- Clamp the relevant hose, to minimise coolant loss.

5.

Installation

1. To install, reverse the removal procedure.

2. NOTE: Position cloth to collect fluid spillage.

Loosen the cooling system bleed screw.

3.  CAUTION: Anti-freeze concentration must be maintained at 50%.

Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

- When coolant runs from the bleed point bubble-free, tighten the bleed screw.

4. Install the coolant expansion tank cap.

5.  CAUTION: Do not RUN the engine with the coolant expansion tank pressure cap removed. Failure to follow this instruction may cause damage to the vehicle.

Start and run the engine.

6. Set the heating system to MAX heat, the blower motor to MAX speed and the air distribution to the instrument panel registers.

7.  CAUTION: Observe the engine temperature warning light. If the warning light is displayed, switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle

Allow the engine to run until hot air is emitted from the instrument panel registers, while observing the engine temperature warning light.

8. Switch the engine off.

9. Allow the engine to cool.

10. Release the cooling system pressure.

- Remove the coolant expansion tank pressure cap.

11. Top up the cooling system.

- Fill the cooling system up to the MAX mark on the coolant expansion tank using a fifty percent mixture of Jaguar Premium Cooling System Fluid or equivalent, meeting Jaguar specification WSS M97B44-D and fifty percent water.

12. Install the coolant expansion tank pressure cap.

13. Install the engine cover. For additional information, refer to: [Engine Cover - 4.2L SC V8 - AJV8](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Removal and Installation

Removal

• CAUTIONS:

Anti-freeze concentration must be maintained at 50%.

Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2. **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. **WARNING:** Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Drain the cooling system.

For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03, General Procedures).

4. Remove the throttle body.
For additional information, refer to: [Throttle Body](#) (303-04A Fuel Charging and Controls - 4.2L NA V8 - AJV8, Removal and Installation).
5. Release the clips and disconnect the 5 coolant hoses.

E63437

6. Remove the thermostat housing.

- Disconnect the engine coolant temperature (ECT) sensor electrical connector.
- Remove the 4 bolts.

E63438

7. NOTE: Do not disassemble further if the component is removed for access only.

Remove the engine coolant temperature (ECT) sensor.

- Remove the retaining clip.

E63440

8. Remove the thermostat.

- Remove the 3 screws.
- Remove and discard the 3 O-ring seals.

E63441

9. Release and remove the thermostat.

Component Description

General

The supercharger cooling system consists of:

- A charge air coolant pump.
- A charge air radiator.
- Two charge air coolers.
- Connecting hoses and pipes.

The supercharger cooling system is operationally independent of the engine cooling system, but connected to it by a hose installed between the charge air radiator and the heater core return line. The connection with the engine cooling system accommodates thermal expansion and retraction of the coolant in the supercharger cooling system, and assists with filling and draining of the supercharger cooling system. A bleed screw, in the end of a hose attached to the charge air radiator, allows air to be bled from the supercharger and engine cooling systems when filling from empty. A filler plug for the supercharger cooling system is incorporated into the supercharger outlet elbow.

Refer to: [Engine](#) (303-01B Engine - 4.2L SC V8 - AJV8, Description and Operation).

Charge Air Coolant Pump

E98150

ItemDescription

1	Coolant outlet connection
2	Coolant inlet connection
3	Electrical connector

The charge air coolant pump is an electric pump attached to the [RH](#) side of the charge air radiator.

Charge Air Radiator

Fuel Charging and Controls - TDV6 2.7L Diesel - Fuel Charging and Controls - Overview

Description and Operation

Overview

The 2.7L V6 diesel engine is equipped with a HP common rail fuel injection system. With this fuel injection process, a HP pump delivers a uniform level of pressure to the shared fuel lines (the common rails), which serve all 6 fuel injectors. Pressure is controlled to the optimum level for smooth operation.

The common rail system supports a pre-injection (pilot) phase, which reduces combustion noise levels, more commonly referred to as 'diesel knock'.

Fuel injection pressure is generated independently of engine speed and fuel injection events.

The fuel injection timing and volume are calculated by the [ECM \(engine control module\)](#), which then energizes the appropriate piezo actuated injector. The common rail fuel injection system has the following features:

- High fuel injection pressures of up to 1650 bar (23930 lbf/in²) for greater atomisation of fuel (increasing performance and lowering emissions).
- Variable injection to optimize combustion in all engine operating conditions.
- Low tolerances and high precision throughout the life of the system.

The fuel system is divided into two sub systems:

- LP system.
- HP system.

The LP system features the following components:

- In-tank fuel pump.
- Fuel pressure regulator (integral to the fuel delivery module).
- Fuel filter.
- Return pipes.
- Injector return pipes.
- Fuel coolers (engine and vehicle).

The LP system is regulated to 0.5 bar (7.25 lbf/in²).

The HP system features the following components:

- HP pump.
- Fuel rails and diverter rail
- HP fuel pipes.
- Injectors.

Fuel Charging and Controls - TDV6 2.7L Diesel - Fuel Charging and Controls - System Operation and Component Description

Description and Operation

System Operation

Engine Starting

During starting, the fuel rail pressure must be at least 150 bar (2175 lbf/in²). Should the pressure be below this figure, the injectors will not operate, resulting in the vehicle not starting.

Engine Stopped

To stop the engine the [ECM \(engine control module\)](#) stops energizing the piezo actuators, therefore, no fuel is injected and the engine speed drops to zero.

Refer to: Electronic Engine Controls (303-14 Electronic Engine Controls - 2.7L Diesel, Description and Operation).

Component Description

LP System

In-tank Fuel Pump

The electric fuel pump is located inside the fuel tank. Fuel is pumped from the tank via the in-tank fuel pump, to the HP pump via the fuel filter.

Refer to: Fuel Tank and Lines (310-01 Fuel Tank and Lines - 2.7L Diesel, Description and Operation).

Fuel Filter

The fuel filter is located in the engine compartment on the left hand side, packaged to be protected against damage. Incorporated in the fuel filter housing is a bimetallic temperature valve, which will start to close at 30 °C (86 °F) and will fully close at 50 °C (122 °F). This allows pre-heated diesel fuel to circulate inside the fuel filter to prevent waxing in cold operating conditions.

Refer to: Fuel Tank and Lines (310-01 Fuel Tank and Lines - 2.7L Diesel, Description and Operation).

Fuel Cooler

Two fuel coolers are fitted to the vehicle. One is located in the 'vee' of the engine block, and has a coolant system connection to aid heat transfer. The second cooler is located in the fuel return line and is a fuel to air cooler.

Refer to: Fuel Tank and Lines (310-01 Fuel Tank and Lines - 2.7L Diesel, Description and Operation).

HP System

HP Pump

E50833

The HP pump is a three-piston (120 degree apart) radial plunger pump with a HP displacement of 0.8 cc (0.05 in³). As mentioned, it has the ability to produce a maximum pressure of 1650 bar (23930 lbf/in²). The housing is cast from iron, the flange is cast from aluminum.

The HP pump is driven from the camshaft via a toothed belt. It does not need to be timed to the engine during belt replacement in service.

The required supply pressure to the HP pump is -0.3 to +0.5 bar (-4.4 to 7.25 lbf/in²). The return pressure is -0.3 bar to +0.8 bar (-4.4 to 11.6 lbf/in²).

The pump is sized to deliver sufficient fuel to the fuel rails for all engine-operating conditions.

The HP pump consists of the following components:

- ITP (internal transfer pump).
- VCV (volume control valve).
- HP pumping elements (3 off).
- PCV (pressure control valve).

The ITP is a five vane pump. This conveys fuel to the VCV.

The VCV is a variable position solenoid valve electronically controlled by the [ECM](#). The VCV is located between the ITP and the HP pumping elements. The VCV determines the amount of fuel that is delivered to the HP pumping elements. When there is no signal to the VCV the valve is closed and there is no fuel delivery.

The three HP pumping elements are connected together in a fuel ring circuit within the pump. There is a single HP outlet connection for the HP pipe to the HP diverter rail.

The PCV is a variable position solenoid valve electronically controlled by the [ECM](#). The PCV is located between the HP pumping elements and the HP outlet connection. The PCV regulates the amount of fuel pressure in the fuel rails. When there is no signal to the PCV the valve is open, therefore no fuel rail pressure can be generated.

HP Fuel Flow

E50834

ItemDescription

A	LP fuel supply
B	Fuel supply to the HP pumping elements
C	HP outlet connection to the HP diverter rail
D	LP fuel return (spill)
1	LP side of ITP
2	ITP pressure relief valve
3	Screen filter
4	VCV
5	ITP
6	Edge filter - to protect PCV
7	PCV
8	N/A
9	Eccentric on HP pump drive shaft

10	Pumping element inlet valve
11	Pumping element outlet valve
12	HP ring line
13	HP pump elements (3 off)
14	Lubricating valve

The fuel induced by the ITP (5) is conveyed to the VCV (4) and the lubricating valve (14). When the VCV is closed, the ITP pressure relief valve (2), lying parallel to the transfer pump, opens and conveys the fuel back to the LP side (1) of the transfer pump. The fuel passes through the lubricating valve (14) into the interior of the HP pump and from there to the fuel return (D). The fuel is used to lubricate the pump.

The VCV (4) determines the quantity of fuel (B) that is supplied to the pumping elements (13). The fuel from the HP outlets (11) of the three pumping elements comes together in a ring line (12) and is conveyed through the HP outlet of the HP pump to the fuel rails.

The PCV (7) regulates the fuel pressure in the fuel rails. Reducing pressure via the PCV results in fuel returning from the fuel rails to the LP fuel return (D).

HP Pump Pressure/Speed Graph

E50835

ItemDescription

A	Pump pressure (bar)
B	Pump speed (rpm)

The HP pump can supply up to 1600 bar (23206 lbf/in²) fuel pressure continuously with short excursions to 1650 bar (23930 lbf/in²). Pump speed is 5/6 engine speed. However, it is calibrated to deliver fuel pressure dependant upon engine speed and load.

When the HP pump is rotated, pressure is created when the VCV is open and the PCV is closed. The VCV and PCV are electronically controlled to allow variable fuel delivery and pressure control.

When the [ECM](#) actuates the piezo actuators, the fuel rail pressure drop is off-set by additional fuel being delivered to the fuel rails by the PCV.

The fuel pressure in the system is reduced within a few seconds after the engine has stopped as the PCV no longer has the holding current it requires, and therefore opens. No residual pressure remains in the system and the fuel is returned to the fuel return line (D) through the open PCV.

High Pressure Element Fuel Induction

E50836

ItemDescription

A	Fuel inlet flow
1	Inlet valve
2	Outlet valve
3	Piston
4	Driveshaft
5	Eccentric cam

During the downward motion of the piston (3), a vacuum in the pump cylinder is generated, which opens the inlet valve (1) against the force exerted by the valve spring. The fuel (A), which is flowing past the VCV, is sucked in. At the same time the outlet valve (2) is closed due to the pressure difference between the pump cylinder and the HP fuel in the ring line.

High Pressure Element Fuel Delivery

E50837

ItemDescription

B Fuel outlet flow to ring line

1 Inlet valve

2 Outlet valve

3 Piston

4 Driveshaft

5 Eccentric cam

The eccentric cam on the HP pump driveshaft (5) presses the piston (3) upwards. The inlet valve (1) is then closed through the force exerted by the valve spring and the pressure being built up in the pump cylinder. The outlet valve (2) opens when the pressure in the pump cylinder is greater than the fuel pressure in the ring line (B).

Volume Control Valve

E50838

ItemDescription

1 Piston

2 Sleeve

3 Compression spring

4 Coil

5 Armature

6 VCV

The VCV is fixed directly to the HP pump. The VCV regulates the fuel supply (and hence the quantity of fuel) from the transfer pump to the HP pump elements, depending on the pressure in the fuel rails. This makes it possible to match the delivery of the HP pump to the requirements of the engine from the LP side. The quantity of fuel flowing back to the main fuel supply line is kept to a minimum. In addition, this adjustment reduces the power consumption of the HP pump, improving the efficiency of the engine.

The VCV default position is closed without electrical supply. An open circuit connector will prevent the engine from running.

E50839

ItemDescription

A	VCV not actuated
B	VCV actuated
1	Fuel supply from the transfer pump
2	Piston
3	Fuel supply to the HP pump
4	Coil energized
5	Quantity of fuel
6	Control current
7	VCV at constant engine speed

VCV Not Actuated (A)

When there is no power supplied, the piston (2) closes the opening between the two connections (1) and (3) through the force of the compression spring. The fuel supply to the HP pump is interrupted.

VCV Actuated (B)

The **ECM** energizes the coil (4) of the valve, according to the engines requirements. The armature force is proportional to the control current and counteracts the compression spring through the moving piston (2).

As a result, the opening between the two connections (1) and (3) and hence the quantity of fuel (5) supplied through the connector (3) to the HP pump is also proportional to the control current (6). This means that the greater the opening cross-section, the greater the quantity of fuel supplied.

Pressure Control Valve

E50840

The PCV is located on the HP pump. It governs the fuel pressure at the HP outlet of the HP pump and thus the pressure within the fuel rails. In addition, the PCV dampens any fluctuations in pressure, which occur during the delivery of fuel through the HP pump and through the injection process. The PCV ensures that optimum pressure exists in the fuel rails for every operating condition of the engine.

The PCV is an electro-magnetically operated valve with spring support. The current supplied by the **ECM** through the solenoid pulls back the control pin. This allows fuel to flow through the ball valve and into the common rails. The entire armature is coated with fuel for lubrication and cooling.

E50841

ItemDescription

A	PCV non-controlled
B	PCV controlled
1	Fuel from the HP pump
2	To fuel return
3	Ball valve
4	Compression spring

5	Armature
6	Coil energized
7	Control pin
8	HP fuel
9	Control current
10	Characteristic of the PCV

PCV Non-controlled (A)

The ball valve (3) will only be operated through the force exerted upon it by the spring (4). Thereby, the PCV is classed as open.

PCV Controlled (B)

The current flowing through the solenoid (6) draws the pin (7) down. This in turn transfers the magnetic force via the pin to the ball valve (3). The pull of the pin, and the pressure on the ball valve, is proportional to the valve flow (9).

Fuel Rails

E50842

The fuel rails are manufactured from forged steel. They store the fuel at high pressure and prevent pressure fluctuations in the HP system. All HP pipes have an internal diameter of 2.5 mm (0.098 in.) except the pipes to the injectors, which are 3.0 mm (0.118 in.). Total rail volume is 33 cc (2.01 in³).

Fuel Injectors

E50843

ItemDescription

1	Harness connection
2	HP connection
3	Control piston
4	Nozzle needle
5	Nozzle HP chamber
6	Nozzle spray holes
7	Valve mushroom
8	Fuel return
9	Valve piston
10	Piezo actuator

The fuel injectors are controlled by piezo-electric action, activated directly by the [ECM](#) to precisely match instantaneous speed and load conditions. The piezo injector operates four times faster than traditional solenoid injectors, with switching times as little as 0.2 milliseconds. This enables minimal quantities of fuel to be metered with extreme accuracy, and the start of injection to be determined with even greater precision and at multiple times during each engine stroke. The injectors have six orifices, each having a diameter of 145 microns (0.0057 in.). This produces an extremely fine spray of fuel, which ensures the most uniform fuel-air mixture possible. As a result, the combustion process is more complete. The operating components of the piezo fuel injectors are:

- The piezo actuator.
- The injector body containing the hydraulic servo system.
- The fuel injector nozzle.

Each injection event is controlled by a charge and discharge cycle allowing energy to dissipate in, and recover from, the injector. Never disconnect the wiring connector when the vehicle is running. The injector may remain open thus causing engine damage.

Fuel Injector Not Actuated (Not Injecting Fuel)

E50844

ItemDescription

1	Piezo actuator
2	HP connection
3	Hydraulic force applied on control piston
4	Hydraulic force acting on tip of nozzle
5	Control piston
6	Fuel return
7	Fuel return
8	Control piston
9	Nozzle needle
10	HP chamber of nozzle
11	Control chamber
12	Valve mushroom

The HP fuel from the fuel rail passes through the HP connection (2) into the control chamber (11) and into the HP chamber (10) of the fuel injector nozzle. The piezo actuator (1) is de-energized and the valve mushroom (12) closes the bore to the fuel return (7) by means of spring pressure. There is a continuous fuel return (6) to vent internal leakage within the injector. The hydraulic force (3), which is now applied on the control piston by the fuel under high pressure in the control chamber (11) through the control piston (8), is greater than the hydraulic force (4) acting on the tip of the nozzle (since the area of the control piston in the control chamber is greater than the area of the tip of the nozzle).

Fuel Injector Actuated (Injecting Fuel)

E50845

ItemDescription

1	HP supply
2	Valve piston
3	Hydraulic force applied on control piston
4	Hydraulic force acting on tip of nozzle
5	Control piston
6	Fuel return
7	Piezo actuator
8	Fuel return
9	Valve piston
10	Valve mushroom
11	Control chamber
12	Control piston
13	Nozzle needle

The piezo actuator (7) energized by the [ECM](#) extends (charging phase) and presses on the valve piston (9). The valve mushroom (10) opens the bore, which connects the control chamber (11) to the fuel return (8 then 6). As a result, the pressure in the control chamber drops, and the hydraulic force (4) acting on the tip of the nozzle needle is now greater than the force (3) acting on the control piston in the control chamber. The nozzle needle (13) moves upwards and the fuel passes through the six spray holes into the combustion chamber.

Fuel Charging and Controls - TDV6 2.7L Diesel - Fuel Charging and Controls

Diagnosis and Testing

Principles of Operation

For a detailed description of the diesel engine fuel charging and controls, refer to the relevant Description and Operation sections in the workshop manual. REFER to: (303-04A Fuel Charging and Controls - TDV6 2.7L Diesel)

[Fuel Charging and Controls](#) (Description and Operation),
[Fuel Charging and Controls](#) (Description and Operation),

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

• NOTE: If the control module/component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action
P000113	Fuel Volume Regulator Control Circuit/Open	<ul style="list-style-type: none"> Fuel volume regulator control circuit - open circuit Fuel volume regulator control valve failure 	Refer to the electrical circuit diagrams and check fuel volume regulator control circuit for open circuit. Materials

Name	Specification
Cleaning Fluid	W-M5B411-A

• WARNINGS:

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable mixtures are always present and may ignite. Failure to follow these instructions may result in personal injury.

 Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the high-pressure system can be as high as 1650 bar. Failure to follow this instruction may result in personal injury.

 Eye protection must be worn at all times when working on or near any fuel related components. Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 Make sure that the workshop area in which the vehicle is being worked on is as clean and dust-free as possible. Areas in which work on clutches, brakes or where welding or machining are carried out are not suitable in view of the risk of contamination to the fuel system.

 Make sure that clean non-plated tools are used. Clean tools using a new brush that will not lose its bristles and fresh cleaning fluid, prior to starting work on the vehicle.

 Use a steel topped workbench and cover it with clean, lint-free non-flocking material.

 Make sure that all parts removed from the vehicle are placed on the lint-free non-flocking material.

 Make sure that any protective clothing worn is clean and made from lint-free non-flocking material.

 Make sure that any protective gloves worn are new and are of the non-powdered latex type.

 Before using the cleaning fluid, protect all electrical components and connectors with lint-free non-flocking material.

1. Using a new brush that will not lose its bristles, brush cleaning fluid onto the components being removed and onto the surrounding area.
2. Using a pneumatic vacuum gun, remove all traces of cleaning fluid and foreign material.
3. Dispose of any used cleaning fluid and the brush after completing the repair.

Fuel Charging and Controls - TDV6 2.7L Diesel - Fuel Injector

Removal and Installation

Special Tool(s)	
 <p>303-1127</p> <p>E54552</p>	<p>Fuel Injector remover</p> <p>303-1127</p>

Removal

• WARNINGS:

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

 Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

 Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

 Do not disconnect the fuel injector electrical connectors with the engine running. Failure to follow this instruction may result in serious damage to the engine.

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

 Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

1. Disconnect the battery ground cable.
For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).
2. Remove the exhaust gas recirculation (EGR) valve outlet tube.
For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).
3. Remove the injector sound proofing.

E 64529

4. Remove the engine harness cover.

5. Remove the engine wiring harness casing.

6. Disconnect the fuel injector electrical connectors.

7. Detach the fuel injection wiring harness.

8. CAUTIONS:

 Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Do not use any aggressive cleaning fluid or a wire brush to clean the fuel injector nozzle.

Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel rail supply lines, the fuel injectors, the fuel rail and the fuel pump.

For additional information, refer to: [Fuel Injection Component Cleaning](#)

9. CAUTIONS:

 Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Make sure that the fuel injector adaptor union does not move when loosening the high-pressure fuel supply lines. Failure to follow this instruction may result in damage to the fuel injector or the fuel injector adaptor union.

Loosen the high-pressure fuel supply line from the fuel injector and fuel rail.

10.  **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.

Remove and discard the high-pressure fuel supply line.

11. NOTE: Left-hand shown, right-hand similar.

Disconnect the fuel return line from the fuel injector.

- Remove and discard the retaining clip.

12. Remove the two fuel injector retaining bolts.

13. Install the special tool studs.

14. CAUTIONS:

 Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

 Make sure the puller bolts are rotated evenly. Failure to follow this instruction may result in damage to the special tool or the fuel injector.

Install the special tool remover legs to the studs.

15. Install the special tool locking plate to the remover legs.

16. CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove the fuel injector.

- Rotate the special tool bolts evenly, in a clockwise direction.
- Remove the special tool.
- Remove and discard the fuel injector retaining clamp.
- Remove and discard the sealing washer.

Installation

1. CAUTION: Do not use tools to install the new fuel return line retaining clip. Failure to follow this instruction will result in damage to the retaining clip.

- NOTE: Install a new fuel injector sealing washer.
- NOTE: Install a new fuel return line retaining clip.

Install a new fuel injector retaining clamp.

E52071

2. Install the fuel injector.

- Tighten to 10 Nm.

E66274

3. CAUTION: Make sure the fuel return line clip is correctly installed to the fuel injector before installing the fuel return line.

- NOTE: Left-hand shown, right-hand similar.

Connect the fuel return line to the fuel injector.

- Visually inspect the fuel return line O-ring seal for damage.
- Apply a light coating of petroleum jelly to the fuel return line O-ring seals.
- Connect the fuel return line to the fuel injector.

E55233

4. CAUTIONS:

 Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the high-pressure fuel supply line and allow foreign matter to enter the fuel injection system.

 Maintain pressure on the high-pressure fuel supply lines to keep the olives in contact with the fuel rail and the fuel injector cones while installing unions.

- NOTE: Remove and discard the blanking caps.

Install the new high-pressure fuel supply lines.

- Install the new high-pressure fuel supply line, tighten the fuel supply line unions finger tight.
- Tighten the high-pressure fuel supply line in the shown sequence.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 15 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 15 Nm.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 30 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 30 Nm.

5. NOTE: Left-hand shown, right-hand similar.

Attach the fuel injector wiring harness.

6. NOTE: Left-hand shown, right-hand similar.

Connect the fuel injector electrical connectors.

7. Install the engine wiring harness casing.

- Tighten to 4 Nm.

8. Install the engine wiring harness cover.

9. Install the injector sound proofing.

10. Install the EGR valve outlet tube.

For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

11. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

12.  **WARNING:** Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

Start and run the engine.

- Visually check for fuel leaks.
- The fuel return line must be renewed if any leaks are found from the fuel return line O-rings.

Removal

1. WARNINGS:

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Do not remove the fuel rail pressure sensor from the fuel injection diverter rail.

Disconnect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

2. Remove the fuel injection pump belt.

For additional information, refer to: [Fuel Injection Pump Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

3. Remove the engine compartment brace.

4. Using the special tool, remove the fuel injection pump pulley retaining nut.

- Using the special tool, retain the fuel injection pump pulley.
- Remove the special tool.

5. Using the special tool, remove the fuel injection pump pulley.

- Remove the special tool.

6. Remove the fuel injection pump belt cover backplate retaining bolt.

7. Remove the fuel injector sound proofing.

8.  **CAUTION:** Make sure that all openings are sealed. Use new blanking caps.

Disconnect the low pressure fuel inlet and return lines.

9. Detach the engine wiring harness retaining bracket.

E52301

10. NOTE: Left-hand shown, right-hand similar.

Detach the high-pressure fuel supply lines.

E52303

11.  CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

• NOTE: Left-hand shown, right-hand similar.

Loosen the high-pressure fuel supply lines.

E52351

12. Clean around the fuel injector, high-pressure fuel supply line and surrounding areas.
For additional information, refer to: Fuel Injection Component Cleaning (303-04, General Procedures).

13.  CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove and discard the high-pressure fuel supply lines.

E52304

E52351

14. CAUTIONS:

 Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Make sure that all openings are sealed. Use new blanking caps.

• NOTE: Left-hand shown, right-hand similar.

Remove and discard the high-pressure fuel diverter rail supply line.

E53297

15. Remove the fuel line retaining nut.

E52309

16. Disconnect the fuel rail pressure (FRP) sensor electrical connector.

- Release the fuel charging wiring harness.

E52311

17. Reposition the fuel line.

E55245

18. Remove the FRP and fuel injection diverter rail assembly.

- Remove the 2 studs.

19.  CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the fuel line.

20. Disconnect the left-hand valve cover breather hose.

21. Disconnect the right-hand valve cover breather hose.

22. Disconnect the left-hand inlet port deactivation vacuum pipe.

23. Remove the oil separator housing.

- Remove and discard the oil separator housing and engine block seals.

24. Disconnect the fuel injection pump electrical connectors.

25. Detach the glow plug electrical connectors.

26. Remove the fuel injection pump.

Installation

1. WARNINGS:

 Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

 Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

 This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

• CAUTIONS:

 Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

 Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Diesel fuel injection equipment is manufactured to very precise

tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

 Do not remove the fuel rail pressure sensor from the fuel injection diverter rail.

Install the fuel injection pump.

- Tighten to 23 Nm.

2. Attach the glow plug electrical connectors.

3. Connect the fuel pump electrical connectors.

4. Install the oil separator housing.

- Install new oil separator housing and engine block seals.

5. Connect the left-hand inlet port deactivation vacuum pipe.

6. Connect the right-hand valve cover breather hose.

7. Connect the left-hand valve cover breather hose.

8. NOTE: Remove and discard the blanking caps.

Connect the fuel line.

9. Install the FRP and fuel injection diverter rail assembly.

- Install the two retaining studs, but do not fully tighten at this stage.

10. Attach the fuel line.

11. Connect the FRP sensor electrical connector.

E52309

12. Install the fuel line retaining nut.

- Tighten to 7 Nm.

E53297

13. NOTE: Remove and discard the blanking caps.

Install a new high-pressure fuel supply line.

- Install a new high-pressure fuel supply line but do not fully tighten at this stage.
- Tighten the fuel injection diverter rail retaining studs to 23 Nm.
- Tighten the high-pressure fuel supply line in the shown sequence.
- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection pump to 15 Nm.
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm.
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection pump to 30 Nm.
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm.

E52354

14. NOTE: Left-hand shown, right-hand similar.

Install the new high-pressure fuel rail supply line.

- Remove the blanking caps from the ports.
- Tighten the high-pressure fuel supply line in the shown sequence.
- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm.
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection rail to 15 Nm.
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm.
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection rail to 30 Nm.

E53224

15. NOTE: Left-hand shown, right-hand similar.

Attach the high-pressure fuel supply lines.

- Tighten to 10 Nm.

16. Attach the engine wiring harness.

- Tighten to 7 Nm.

17. Attach the low-pressure fuel line.

- Remove the blanking caps from the ports.

18. Install the fuel injector sound proofing.

19. Install the fuel injection pump belt rear cover retaining bolts.

- Tighten to 7 Nm.

20. Install the fuel injection pump pulley.

21. Install the retaining nut.

- Tighten to 50 Nm.

22. Install the engine compartment brace.

- Tighten to 25 Nm.

23. Install the fuel injection pump belt.

For additional information, refer to: [Fuel Injection Pump Belt](#) (303-05A Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

24. Connect the battery ground cable.

For additional information, refer to: [Battery Disconnect and Connect](#) (414-01 Battery, Mounting and Cables, General Procedures).

25. Bleed the fuel system.

Fuel Charging and Controls - TDV6 2.7L Diesel - Intake Air Shutoff Throttle

Removal and Installation

Removal

1. Remove the engine cover.
For additional information, refer to: [Engine Cover - TDV6 2.7L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
2. Release the coolant expansion tank hose from the clips.

3. Remove the intake air shutoff throttle elbow retaining bolt.

4. Disconnect the 2 electrical connectors.

5. Release the clip and disconnect the intake air shutoff throttle elbow.

6. Release the vacuum hose clip from the stud.

7. Remove the bolt.

8. Remove both exhaust gas recirculation (EGR) valve outlet tubes.
For additional information, refer to: [Exhaust Gas Recirculation \(EGR\) Valve Outlet Tube](#) (303-08A Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

9. Disconnect the electrical connector.

10. Release the fuel return line valve.

11. Reposition the intake air shutoff throttle.

E54246

12. Remove the intake air shutoff throttle.

E54247

13.  CAUTION: Discard the seals.

Remove and discard the 3 O-ring seals.

E55935

Installation

1.  CAUTION: Install the new seals.

• NOTE: Make sure that all the component mating faces are clean.

To install, reverse the removal procedure.

- Tighten to 10 Nm.

E63475

2. Tighten to 10 Nm.

E63471

Fuel Charging and Controls - TDV6 2.7L Diesel - Swirl Plate Actuator Diaphragm

Removal and Installation

Removal

• NOTE: Removal steps in this procedure may contain installation details.

1. For additional information, refer to: [Engine Cover - TDV6 2.7L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).
2. For additional information, refer to: [Secondary Bulkhead Center Panel](#) (501-02 Front End Body Panels, Removal and Installation).
3. Remove the wiring harness cover.
 - Release the 7 clips.

4. Remove the wiring harness carrier.
 - Remove the 4 bolts.

5. Remove the RH injector sound proofing.
 - Release the 2 clips.

6. Check the port deactivation hoses are a secure fit onto the stub pipe and for signs of being trapped or chaffing.
 - If the valve does not hold vacuum continue with the replacement of the diaphragm.
 - If the valve holds vacuum check the valve on the other side of the engine.
 - If one side is found not to hold vacuum then both diaphragms are to be changed.

7. Disconnect the port deactivation valve vacuum hoses.

E115075

8. NOTE: Check the vacuum gauge and any hoses to be used for leaks prior to using on the vehicle.

- NOTE: Make sure the vacuum gauge hose is a secure fit to the port deactivation diaphragm caps.

Using a vacuum gauge, check the port deactivation valve diaphragms.

E115074

9. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the engine bay brace.

E95277

10. Release the port deactivation valve connecting rod.

E115076

11. NOTE: Cut the retaining clips off the old port deactivation diaphragm caps to aid removal.

• NOTE: Make sure the valve cover is not damaged during removal of the port deactivation diaphragm cap.

Remove the port deactivation valve cap.

- Release the 6 clips.
- Check the diaphragm for splits or damage.

E115077

12. Remove the port deactivation valve spring.

E115078

13. Remove the port deactivation valve connecting rod and diaphragm.

E115079

Installation

1. NOTE: Apply a small amount water to the diaphragm to aid installation.

• NOTE: Make sure the diaphragm is fully seated on the connecting rod.

Install the new port deactivation diaphragm to the new connecting rod.

E115143

2. CAUTIONS:

 Make sure that the mating faces are clean and free of foreign material.

 Make sure the port deactivation rod is correctly aligned to the port deactivation valve arm.

• NOTE: Make sure the new port deactivation diaphragm and rod are installed in the correct orientation to the port deactivation linkage.

Install the port deactivation valve connecting rod and diaphragm.

E115144

3. Install the port deactivation valve spring.

4. CAUTIONS:

Using a mirror check all clips are fully latched.

Make sure the port deactivation rod is not rotated once the cap has been installed, if rotation occurs the diaphragm will be damaged.

• NOTE: An audible click is heard when the clips are fully latched.

Install the port deactivation valve cap.

- Make sure the cap is correctly aligned within the timing marks.
- Secure the clips in the sequence shown.

5. Attach the port deactivation valve connecting rod.

6. Repeat the above procedure on the opposite side.

7. NOTE: Check the vacuum gauge and any hoses to be used for leaks prior to using on the vehicle.

Check the port deactivation valve diaphragms using a vacuum gauge.

8. NOTE: When the LH hose is re-connected to the valve the right angle bend must be turned downwards, make sure the hose lies correctly in the gap between the engine cover support and the valve cover.

Connect the port deactivation valve vacuum hoses.

9. Position the port deactivation hose as shown in illustration.

10. Install the RH injector sound proofing.

- Secure with the clips.

11. Install the wiring harness cover.

- Secure in the clips.

12. Install the wiring harness carrier.

- Install the bolts. TORQUE: 10 Nm

13. For additional information, refer to: [Secondary Bulkhead Center Panel](#) (501-02 Front End Body Panels, Removal and Installation).

14. For additional information, refer to: [Engine Cover - TDV6 2.7L Diesel](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
<ul style="list-style-type: none"> ● Intake air system ● Hoses/hose connections ● Turbochargers ● General engine conditions 	<ul style="list-style-type: none"> ● Fuses ● Loose or corroded electrical connectors ● Harnesses ● Sensors/actuators

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and refer to the Symptom Chart.

Symptom Chart

Symptom	Possible Cause	Action
Poor performance (off-boost)	<ul style="list-style-type: none"> ● Low/Contaminated fuel ● Restricted intake air system ● General engine mechanical condition ● Electronic engine control systems failure 	Check the fuel level and condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for restriction. Check the engine condition, compressions, etc for indications of a mechanical fault. Check for DTCs and refer to the relevant DTC Index
No boost	<ul style="list-style-type: none"> ● Electrical connections and harnesses ● Restricted intake air system ● Charge air cooler restricted/leaking ● Turbocharger actuator failure ● Turbocharger failure ● Electronic engine control systems failure 	Check the electrical connections and harnesses. Check the intake air system for restriction/leakage. Refer to the electrical circuit diagrams and check the turbocharger actuators and circuits. Check the turbochargers for wear. Disconnect the turbocharger intake and outlet pipework and turn the turbochargers by hand. Any roughness indicates a fault. Check any up and down movement in the turbocharger shafts. Excessive movement indicates a fault. If in doubt, compare the suspect unit with a new turbocharger. Check for DTCs and refer to the relevant DTC Index
No boost/excessive noise	<ul style="list-style-type: none"> ● Turbocharger failure(s) 	Disconnect the turbocharger intake and outlet pipework and turn the turbochargers by hand. Any roughness indicates a fault. Check any up and down movement in the turbocharger shafts. Excessive movement indicates a fault. If in doubt, compare the suspect unit with a new turbocharger

DTC Index

CAUTION: When probing connectors to take measurements in the course of the pinpoint tests, use the adaptor kit, part number 3548-1358-00

• NOTE: If the control module/component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. Match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines that involve pinpoint tests.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action
-----	-------------	----------------	--------

DTC	Description	Possible Cause	Action
P004711	Turbocharger/Supercharger Boost Control Solenoid A Circuit Low	<ul style="list-style-type: none"> ● Turbocharger boost control solenoid A circuit - short to ground ● Turbocharger boost control solenoid A failure 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check turbocharger boost control solenoid A circuit for short to ground. Suspect the turbocharger boost control solenoid A, check and install a new turbocharger as required, refer to the new module/component installation note at the top of the DTC Index
P004812	Turbocharger/Supercharger Boost Control Solenoid A Circuit High	<ul style="list-style-type: none"> ● Turbocharger boost control solenoid A circuit - short to power ● Turbocharger boost control solenoid A failure 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check turbocharger boost control solenoid A circuit for short to power. Suspect the turbocharger boost control solenoid A, check and install a new turbocharger as required, refer to the new module/component installation note at the top of the DTC Index
P004C00	Turbocharger/Supercharger Boost Control Solenoid B Circuit Low	<ul style="list-style-type: none"> ● Turbocharger boost control solenoid B circuit - short to ground ● Turbocharger boost control solenoid B failure 	Refer to the electrical circuit diagrams and check turbocharger boost control solenoid B circuit for short to ground. Suspect the turbocharger boost control solenoid B, check and install a new turbocharger as required, refer to the new module/component installation note at the top of the DTC Index
P004D00	Turbocharger/Supercharger Boost Control Solenoid B Circuit High	<ul style="list-style-type: none"> ● Turbocharger boost control solenoid B circuit - short to power ● Turbocharger boost control solenoid B failure 	Refer to the electrical circuit diagrams and check turbocharger boost control solenoid B circuit for short to power. Suspect the turbocharger boost control solenoid B, check and install a new turbocharger as required, refer to the new module/component installation note at the top of the DTC Index
P006A21	MAP - Mass or Volume Air Flow Correlation	<ul style="list-style-type: none"> ● Signal amplitude < minimum 	Check high pressure air intake system for leaks and integrity
P006A22	MAP - Mass or Volume Air Flow Correlation	<ul style="list-style-type: none"> ● Signal amplitude > maximum 	Refer to the electrical circuit diagrams and check MAP sensor and turbocharger boost control solenoid A and B VREF circuits for short to ground, power, open circuit
P007C16	Charge Air Cooler Temperature Sensor Circuit Low	<ul style="list-style-type: none"> ● Circuit voltage below threshold 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check charge air cooler temperature sensor signal circuit for short to ground. Check and install a new sensor as required
P007D17	Charge Air Cooler Temperature Sensor Circuit High	<ul style="list-style-type: none"> ● Circuit voltage above threshold 	Refer to the electrical circuit diagrams and check charge air cooler temperature sensor signal circuit for short to power. Check and install a new sensor as required
P007E27	Charge Air Cooler Temperature Sensor Intermittent/Erratic	<ul style="list-style-type: none"> ● Signal rate of change above threshold 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check charge air cooler temperature sensor circuits for poor connections. Check and install a new sensor as required
P023627	Turbocharger/Supercharger Boost Sensor A Circuit Range/Performance	<ul style="list-style-type: none"> ● MAP sensor signal rate of change above threshold 	Refer to the electrical circuit diagrams and check MAP sensor circuits for poor connections. Start engine and allow to idle, check and record ' Manifold air pressure ' datalogger signal, increase engine speed to 1500 rpm, check and record signal. If value of signal has increased by more than 500hPa/10ms suspect the MAP sensor
P023716	Turbocharger/Supercharger Boost Sensor A Circuit Low	<ul style="list-style-type: none"> ● Circuit voltage below threshold ● MAP sensor failure 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check MAP sensor signal circuit for short to ground. Suspect the MAP sensor, check and install a new sensor as required
P023817	Turbocharger/Supercharger Boost Sensor A Circuit High	<ul style="list-style-type: none"> ● Circuit voltage above threshold ● MAP sensor failure 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical circuit diagrams and check MAP sensor signal circuit for short to power. Suspect the MAP sensor, check and install a new sensor as required
P023D21	Manifold Absolute Pressure - Turbocharger/Supercharger Boost Sensor A Correlation	<ul style="list-style-type: none"> ● Signal amplitude below minimum 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Check low pressure air intake system integrity. Check turbocharger rod connection and oil seals. Check for oil ingestion in intake air system. Set ignition status to 'ON', engine 'OFF', check and record ' Boost Pressure Actuator Bank 1 - Measured Position ' datalogger signal, command ' Boost pressure adjustment bank 0 ' datalogger signal from 5% to 95% in 5% increments. Value of signal at 5% should be between 0-20%, value of signal at 95% should be between 80-99%, the incremental data should follow a smooth curve. If turbocharger vanes sticking install a new turbocharger
P023D22	Manifold Absolute Pressure - Turbocharger/Supercharger Boost Sensor A Correlation	<ul style="list-style-type: none"> ● Signal amplitude above maximum 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Check high pressure air intake system integrity. Check turbocharger rod connection and oil seals. Set ignition status to 'ON', engine 'OFF', check and record ' Boost Pressure Actuator Bank 1 - Measured Position ' datalogger signal, command ' Boost pressure adjustment bank 0 ' datalogger signal from 5% to 95% in 5% increments. Value of signal at 5% should be between 0-20%, value of signal at 95% should be between 80-99%, the incremental data should follow a smooth curve. If turbocharger vanes sticking install a new turbocharger

DTC	Description	Possible Cause	Action
P123A21	Barometric - Turbocharger/Supercharger Boost Sensor A Correlation	<ul style="list-style-type: none"> Signal amplitude < minimum 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Recover freeze frame data to determine conditions when DTC logged. Refer to the electrical circuit diagrams and check MAP sensor circuits for short to ground, power, open circuit. Set ignition status to 'ON' engine 'OFF' with engine coolant temperature >0°C, check and record ' Manifold air pressure ' and ' Ambient pressure ' datalogger signals. If signal values are the same, clear DTCs and re-test. If not, value of ' Ambient pressure ' signal should be between 85-106% of 1 atmosphere, if not suspect the ECM, check and install a new ECM as required. If ' Ambient pressure ' signal correct, start engine and allow to idle, value of ' Manifold air pressure ' signal should be between 580-3000hPa, if not install a new MAP sensor
P123A22	Barometric - Turbocharger/Supercharger Boost Sensor A Correlation	<ul style="list-style-type: none"> Signal amplitude > maximum 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Recover freeze frame data to determine conditions when DTC logged. Refer to the electrical circuit diagrams and check MAP sensor circuits for short to ground, power, open circuit. Set ignition status to 'ON' engine 'OFF' with engine coolant temperature >0°C, check and record ' Manifold air pressure ' and ' Ambient pressure ' datalogger signals. If signal values are the same, clear DTCs and re-test. If not, value of ' Ambient pressure ' signal should be between 85-106% of 1 atmosphere, if not suspect the ECM, check and install a new ECM as required. If ' Ambient pressure ' signal correct, start engine and allow to idle, value of ' Manifold air pressure ' signal should be between 580-3000hPa, if not install a new MAP sensor
P132A00	Turbocharger/Supercharger Boost Control A Electrical	<ul style="list-style-type: none"> Turbocharger boost pressure actuator - H-Bridge failure 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Set ignition status to 'ON' engine 'OFF', check and record ' EGR throttle position ' datalogger signal, command ' EGR throttle command ' actuator to 100%, value of signal should be between 85-99%. Command ' EGR throttle command ' actuator to 0%, value of signal should be between 0-15%. If the signal values are outside of specification, suspect the throttle, check and install a new throttle as required. If the signal values are within specification, manually close and open the throttle and check the feedback voltage/resistance, voltage should range from 0.20-4.80volts, resistance should range from 300-2500 Ohms. If these values are out of specification, suspect the throttle, check and install a new throttle as required. If new throttle has been installed and DTC remains, suspect the ECM, check and install a new module as required, refer to the new module/component installation note at the top of the DTC Index
P132A19	Turbocharger/Supercharger Boost Control A Electrical	<ul style="list-style-type: none"> Turbocharger boost pressure actuator - H-Bridge overcurrent 	Carry out any pinpoint tests associated with this DTC using the manufacturer approved diagnostic system. Set ignition status to 'ON' engine 'OFF', check and record ' EGR throttle position ' datalogger signal, command ' EGR throttle command ' actuator to 100%, value of signal should be between 85-99%. Command ' EGR throttle command ' actuator to 0%, value of signal should be between 0-15%. If the signal values are outside of specification, suspect the throttle, check and install a new throttle as required. If the signal values are within specification, manually close and open the throttle and check the feedback voltage/resistance, voltage should range from 0.20-4.80volts, resistance should range from 300-2500 Ohms.
